This supplement includes the abstracts as submitted and corrected by the authors. All abstracts have been reviewed by the International Scientific Committee. The EPH Conference is not responsible for any errors.

SUBSCRIPTIONS

A subscription to *European Journal of Public Health* comprises six issues. Prices include postage by surface mail, or for subscribers in the USA and Canada by airfreight, or in India, Japan, Australia and New Zealand, by Air Speeded Post. Airmail rates are available on request. European Journal of Public Health Advance Access contains papers that have reached corrected proof stage but have not yet been included within an issue. Advance Access is updated regularly.

Annual Subscription Rate (Volume 29, 6 issues, 2019)
Institutional
Print edition and site-wide online access: £574.00/$1158.00/€862.00
Print edition only: £525.00/$1055.00/€792.00
Site-wide online access only: £439.00/$835.00/€659.00
Please note: US$ rate applies to US & Canada, Euros applies to Europe, UK£ applies to UK and Rest of World.

Please visit https://academic.oup.com/eurpub/subscribe for a complete listing of subscription prices.

Full prepayment, in the correct currency, is required for all orders. Orders are regarded as firm and payments are not refundable. Subscriptions are accepted and entered on a complete volume basis. Claims cannot be considered more than FOUR months after publication or date of order, whichever is later. All subscriptions in Canada are subject to GST. Subscriptions in the EU may be subject to European VAT. If registered, please supply details to avoid unnecessary charges. For subscriptions that include online versions, a proportion of the subscription price may be subject to UK VAT. Personal rate subscriptions are only available if payment is made by personal cheque or credit card and delivery is to a private address.

The current year and two previous years' issues are available from Oxford University Press. Previous volumes can be obtained from the Periodicals Service Company, 11 Main Street, Germantown, NY 12526, USA. Email: psc@periodicals.com. Tel: +1 (518) 537 4700. Fax: +1 (518) 537 5899.

For further information, please contact: Journals Customer Service Department, Oxford University Press, Great Clarendon Street, Oxford OX2 6DP, UK. Email: jnls.cust.serv@oup.com. Tel (and answerphone outside normal working hours): +44 (0)1865 353907. Fax: +44 (0)1865 353485. **In the US, please contact:** Journals Customer Service Department, Oxford University Press, 2001 Evans Road, Cary, NC 27513, USA. Email: jnlorders@oup.com. Tel (and answerphone outside normal working hours): 800 852 7323 (toll-free in USA/Canada). Fax: 919 677 1714. **In Japan, please contact:** Journals Customer Services, Oxford University Press, Tokyo 4-5-10-8F Shiba, Minato-ku, Tokyo 108-8386, Japan. Tel: +81 (0) 3 5444 5858. Fax: +81 (0) 3 3454 2929.

Methods of payment. (i) Cheque (payable to Oxford University Press, Cashiers Office, Great Clarendon Street, Oxford, OX2 6DP, UK) in GB£ Sterling (drawn on a UK bank), US$ Dollars (drawn on a US bank), or EU€ Euros. (ii) Bank transfer to Barclays Bank Plc, Oxford Group Office, Oxford (bank sort code 20-65-18) (UK), overseas only Swift code BARC GB 22 (GB£ Sterling to account no. 70299332, IBAN GB89BARC20651870299332; US$ Dollars to account no. 66014600, IBAN GB27BARC20651866014600; EU€ EURO to account no. 78923655, IBAN GB16BARC20651878923655). (iii) Credit card (Mastercard, Visa, Switch or American Express).

European Journal of Public Health is published six times annually by Oxford University Press, Oxford, UK. Annual subscription price is £574.00/ $1158.00/€862.00. European Journal of Public Health is distributed in the USA by Central Mailing Services c/o UKP Worldwide, 1637 Stelton Road B2, Piscataway, NJ 08854.

The US annual subscription price is $1113. Airfreight and mailing in the USA by agent named Central Mailing Services c/o UKP Worldwide, 1637 Stelton Road B1-2, Piscataway, NJ 08854. Periodicals Postage Paid at Piscataway, NJ and additional mailing offices.

US Postmaster: Send address changes to European Journal of Public Health, Oxford University Press, Central Mailing Services c/o UKP Worldwide, 1637 Stelton Road B1-2, Piscataway, NJ 08854. Subscription records are maintained at Oxford University Press, Oxford, UK. Central Mailing Services is acting as our mailing agent.

Oxford Journals Environmental and Ethical Policies

Oxford Journals is committed to working with the global community to bring the highest quality research to the widest possible audience. Oxford Journals will protect the environment by implementing environmentally friendly policies and practices wherever possible. Please see https://academic.oup.com/journals/pages/about_us/ethical_policies for further information on Oxford Journals environmental and ethical policies.

Supplements, reprints and corporate sales

For requests from industry and companies regarding supplements, bulk article reprints, sponsored subscriptions, translation opportunities for previously published material, and corporate online opportunities, please email special.sales@oup.com, Fax: +44 (0)1865 353774 or visit http://www.oupmediainfo.com/#!/

1. INTRODUCTION

We are delighted to introduce this abstract supplement to the European Journal of Public Health which contains the abstracts of papers presented at the 12th European Public Health (EPH) Conference, held 20-23 November 2019 in Marseille, France. This supplement includes abstracts for the main part of the conference, including plenary sessions, oral and pitch presentations, workshops, moderated poster walks and poster displays.

For Marseille 2019, we received 2.025 abstracts including a record number of 150 workshop abstracts. Abstracts were received from 82 countries.

All abstracts were scored by the members of the International Scientific Committee (ISC) of the EPH Conference. The ISC of the Marseille 2019 conference consisted of 92 experts from 27 countries and was chaired by Prof Denis Zmirou-Navier. We are extremely grateful to all ISC members for the hard work this involved. The members of the ISC scoring in 2019 are listed below.

On average, each abstract was scored by 3,6 reviewers, each workshop by 3.5. The average score of the abstracts was 4.39 (last year 4.25). The highest score was 7.00, the lowest 1.33. The average score of workshops was 5.02 (last year 4.95). The highest score was 6.66 and the lowest 2.33.

The highest scoring abstracts are accepted for the EPH Conference. The rejection rate for the abstracts was 16.9% and for workshops, the rejection rate was 40.0%. The EPH Conference Executive Board and representatives from the Local Support Committee met on 11 June 2019 to decide on cut-off points for workshops, oral presentations, pitch presentations and poster presentations, resulting in an excellent selection of workshops and presentations, as showcased in this abstract supplement.

Table 1: cut-off points for the abstracts 2019

Workshops	average score of 5.000 or higher were accepted
Oral presentations (8-minute presentation)	average score of 5.660 or higher were accepted
Pitch presentations (5-minute presentation)	average score of 5.000 or higher were accepted
Moderated poster walks (3-minute presentation)	average score of 4.750 or higher were accepted
Poster displays (throughout the programme)	average score of 3.600 or higher were accepted

Following these decisions, abstracts were grouped in sessions, sessions in tracks and tracks were linked to the content of the plenary programme. The programme for Marseille 2019 is organised in 16 thematic tracks, that mix workshops, oral and pitch sessions.

The 16 thematic tracks are:

A. Solidarity in health
B. Migration and health
C. Digital Health
D. European and global health
E. Public health policy and politics
F. Maternal, child and adolescent health
G. Chronic diseases
H. Health services research, systems and economics
I. Infectious diseases control
K. Mental health / LGBTI and minorities

L. Health assessments / Elderly care / Cancer
M. Healthy living, food and nutrition
N. Health information and health literacy
O. Global health and environmental change
P. Data, evidence and practice
Q. Health workforce / Health at work

The moderated poster walks have their own sessions. And the poster displays are on display throughout the conference.

As always, we greatly enjoyed reading the submissions, and learned much from them. We hope that you will find this volume equally interesting, and even more so the actual presentations, which promise to be of high quality yet again.

Looking forward to seeing you in Marseille,

Dr Yves Charpak, Chair of the 2019 European Public Health Conference

Prof Zmirou-Navier, Chair of the International Scientific Committee

Dr Dineke Zeegers Paget, Director of the EPH Conference Office

2. PLENARY SESSIONS

PLENARY 1

Building bridges between different professions and communities as a means to implement the Social Development Goals (SDGs)

Organized by: WHO EURO, EUPHA

Moderators: Natasha Azzopardi Muscat, President EUPHA, Anna Cichowska Myrup, Programme Manager Public Health Services, WHO Regional Office for Europe

Following the plenary at the Ljubljana 2018 conference presenting a Roadmap to implement the 2030 Agenda for Sustainable Development, this plenary will focus on building bridges between different professions and communities as a means to implement the Sustainable Development Goals (SDGs). Building on Health 2020, the European policy for health and well-being sets out five interdependent strategic directions:

1. Governance: advancing governance and leadership for health and well-being;
2. equity and social justice: leaving no one behind;
3. partnerships for health: preventing disease and addressing health determinants by promoting multi- and intersectoral policies throughout the life-course;
4. local action: establishing healthy places, settings and resilient communities; and
5. Universal Health Coverage: strengthening health systems for universal health coverage.

In this plenary, we will take the discussion one step further: What were the *key decisions* that were taken by policymakers and which *partnerships* made it happen? What *ways of working* did we adopt and how did we *manage the necessary changes*? The stage on how to develop leadership and innovation capabilities needed to achieve the SDGs will be set by the founder of the Presencing Institute, Dr Otto Scharmer. Three professionals (representing a research institute, an international health organization and a city council) reflect on the year 2018 and how their work, in partnership with other sectors, has shaped the future we are now in.

Keynote speaker:
C. Otto Scharmer
Senior Lecturer, MIT Management Sloan School, Cambridge, USA

Panellists:
Miklós Szócska
Director Health Services Management Training Center, Semmelweis University, Budapest, Hungary

Paula Vassalo
President of the European Dental Public Health Association (EADPH)

Ricardo Baptista Leite
Member of Parliament, Head of Public Health at Católica University of Portugal, and former Deputy Mayor of Cascais, Portugal

PLENARY 2

Building bridges for migration in a planetary context

Organized by: ECDC, EUPHA (IDC)

Moderators: Karl Ekdahl, ECDC, Michael Edelstein, EUPHA (IDC)

Europe is experiencing high volumes of migration, both within and to the region. Globally, several factors contributing to high-volume migration, ranging from economic ones (migrant workers) to forced displacement caused by conflict, persecution and climate changes (draught or other extreme weather conditions) severely affecting living conditions. The International Organisation for Migration (IOM) has estimated that in 2017, the number of international migrants living in Europe reached 78 million, over 10% of the European population, and that two-thirds of international migrants live in Europe or Asia. In EU countries, an estimated 22.3 million migrants are non-EU citizens (data as of 1 January 2018) and in 2017 alone, the EU has seen 2.4 million new arrivals from non-EU citizens to its Member States. Inevitably, this trend has significant implications for public health in Europe.

Migration has significant implications for public health in Europe. Beyond potential pressures on healthcare systems, that can occur especially in instances of large scale rapid migration, some subgroups of migrants, particularly those forcibly displaced or those originating from countries with weak health systems (i.e. refugees, asylum seekers and irregular migrants) are particularly vulnerable and susceptible to infections. This may be due to the fact that they could come from countries with high prevalence of infectious diseases and/or low vaccine coverage. In addition, the migration journeys or substandard living conditions in overcrowded migrant centres may have increased the risk of contracting an infection. This plenary session will showcase several bridges contributing to strengthening public health functions and services in terms of migration, pinpointing the crucial importance of:

- public health resources and cross-sectoral cooperation: the case of the Mediterranean Programme for Intervention Epidemiology Training (MediPIET) building capacity in the EU enlargement and European Neighbourhood countries with particular focus on global health security; the impact of the programme on capacity building among infectious disease epidemiologists in a small country with a large influx of migrants;
- public health guidance: the case of guidance on screening and vaccination for infectious diseases in newly arrived migrants within the EU/EEA;
- public health policy and advocacy: the case of WHO Global Action Plan to promote the health of refugees and migrants;
- involvement of the affected population in the discussion and decision-making.

The aim of this one-hour session is to stir the debate around migrant health issues and infectious diseases in the European context. The panel will start with a keynote speaker, followed by a lively expert discussion reflecting different perspectives.

Key question/s addressed: How important is cross-sectoral and cross-regional cooperation in terms of migration and public health? How can we approach migration within and to Europe as a benefit for the region?

Keynote speaker:
Khalid Koser
Global Community Engagement and Resilience Fund (GCERF)

Panellists:
Nada Ghosn
Epidemiological Surveillance Unit, Ministry of Public Health, Lebanon

Sally Hargreaves
Imperial College London, UK

Abal Moindazde
France

Isabel de la Mata
DG SANTE, European Commission

PLENARY 3

Bridging towards the future of public health in Europe (I). Where can and should we go from here?

Organized by: European Commission, EUPHA

Moderators: Isabel de la Mata, DG SANTE, European Commission, Natasha Azzopardi Muscat, President EUPHA

Europe is entering the third decade of the 21st century and health is on the agenda. Or is it? It seems that with Europeans healthier than ever and enormously improving our ability to prevent and treat current diseases, health seems to be a theme of the past. At the same time, the society is in turmoil and both old and new health challenges are threatening Europe. The changing demographics–climate change, urbanization, migration and ageing–the technological and digital revolution–given us both medical technology as fake news, genetic mapping and new addictions (gaming)–and the resurgence of old diseases such as measles, all lead to the necessity of bridging our previous successes with the need for a new public health in the future.

In 2019, several changes are occurring: we will have a new regional director for WHO Europe and we will have both a new European Parliament, a new European president of the European Commission, a new European Commission and a new European Commissioner for Health. And these changes have led to a new discussion on the necessity of health as a European topic.

In this plenary session, we will look at the priorities in public health from the perspective of the European Commission, the Finnish presidency of the European Council and the European Public Health Association. Finally, we have invited a young professional to reflect on the plans proposed in this session.

Panellists:
Anne Bucher
Directorate-General for Health and Food Safety (DG SANTE), European Commission

Liisa-Maria Voipio-Pulkki
Ministry of Social Affairs and Health, Finland

Dineke Zeegers Paget
Executive Director EUPHA

Sara McQuinn
Coordinator EUPHAnxt

PLENARY 4

Bridging towards the future of public health in Europe (II). Can we and how do we ensure Health in All EU Policies?

Moderators: Josep Figueras, European Observatory on Health Systems and Policies

The plenary will continue the debate on The future of Public Health in Europe introduced in the previous plenary, tackling the role of the EU and its institutions in ensuring that health is addressed in all EU policies. The EU is firmly committed to implementing the 2030 Agenda and the Sustainable Development Goals through its range of institutional mechanisms. Incoming Commission President von der Leyen has pledged to refocus the European Semester ‘to make sure we stay on track with our SDGs’. These developments, together with the broad recognition of the central role of health in the SDGs and the momentum given by the new EU policy cycle presents a unique window of opportunity to critically reappraise the role of health in the EC, which, at least, on paper makes for an ideal Health in All Policies institution.

The first keynote by Director General Anne Bucher, DG SANTE, will draw on the ‘hot of the press’ results of the November 2019 State of Health in the EU exercise, including the EU Country Health Profiles and the Commission Staff Companion Report. She will highlight the main health and health system challenges faced by EU Member States—ranging from the burden posed by preventable mortality to the vaccination crisis and the resilience of the health workforce.

Prof. Scott Greer’s keynote will contend that to tackle these challenges we need to go beyond Public Health Article 168 and its subsidiarity corset. He will speak to the need to proactively employ the much stronger (health) policy tools within the large body of EU law underlying the internal market and to draw on the EU’s newfound role in fiscal governance such as through the European semester. Prof. Greer will draw on the innovative results of the new edition of the seminal study ‘Everything you always wanted to know about European Union health policies but were afraid to ask’ which will be distributed to participants.

The following panel will debate on the practical implementation and political economy questions arising from the plenary’s postulates. Prof. John Middleton, ASPHER’s president, will address the implications for the Public Health profession such as training in public health leadership, overhauling public health competencies or indeed the understanding of the public health profession itself. The second panellist will address the political economy implications of bringing health across EU policies and how to bypass the complexities of working across policy sectors in the EU institutions. The panel will actively interact with the participating audience through a range of innovative ways.

Panellists:
Anne Bucher
DG SANTE, European Commission

Scott L. Greer
Health Management and Policy, University of Michigan

John Middleton
The Association of Schools of Public Health (ASPHER)

PLENARY 5

Migrant inequalities in urban settings and changing public health practice

Organized by: EuroHealthNet

Moderator: Caroline Costongs, EuroHealthNet

More than half of the world's population now lives in urban areas, and urbanization has significant impacts on the whole of society. Cities are major destinations for internal and external migration alike. Access to services, affordable housing and quality employment in urban areas are challenges common to all vulnerable populations, including migrants. These difficult circumstances–and rising inequalities generally–have strained social inclusion efforts across Europe. In addition, migration has become highly politicized; fake news is used to undermine trust and divide communities. This leads to increased discrimination and is restricting access to education, work, justice and health. Power disparities lead to health inequalities. In this environment, policymakers, civil society actors and community advocates must work collaboratively and creatively across sectors to improve health and social outcomes not only for migrants, but for all vulnerable populations in urban environments. How can public health practice adapt to this context to better address the needs of migrants as well as other vulnerable populations? We should move away from describing the problems to work on the solutions. How can we change public perceptions? How can normative agencies and research institutions respond to and support the needs/challenges of public health practitioners 'on the ground' in cities?

This session will attempt to address these and related critical questions, discussing the way forward for health equity and urban and migrant health while highlighting inspiring case studies.

Topics include:

- What are some of the key 'myths' about migrant communities, living and working in cities, that must be corrected to facilitate social integration and improve service provision? Are migrants a burden on services (health, long term care, social care, childcare) or contributors? Are they receiving more benefits than contributing in taxes? How to respond to discrimination/racism and stigmatization?
- How do we ensure that urban health and social services are person-centred and founded on the principles of proportionate universality? Given the diversity of migration flows to cities, how do we develop appropriate public services for each group, considering cultural dimensions as well as nurture and build on their existing skills and resources?
- What is the role of living and working situations in shaping opportunities and health outcomes for migrants? Can housing, schools, workplaces or urban renewal projects in communities be used to build bridges to other forms of support?
- Where is public health failing and what needs to be changed for improved health and wellbeing and reduced inequalities, giving current contexts as described above? What can be done at the European level to address urban and migrant health issues?

3. PARALLEL PROGRAMME

1.A. Poverty homelessness and health

Quantitative research on health determinants in high-income countries: Systematic literature review

Vladimira Varbanova

V Varbanova[1], *P Beutels*[1]
[1]CHERMID, Antwerp University, Antwerp, Belgium
Contact: vladimira.varbanova@uantwerpen.be

Background:

Identifying determinants of health and understanding their role in health production is an important research theme. In recent decades data have become more accessible and multi-country analyses offer an appealing way to potentially enrich such research.

Methods:

We followed the PRISMA guidelines to systematically identify, triage and review literature published between 2013 and early 2018. Forty-three studies that performed cross-national statistical analyses aiming to evaluate the impact of one or more aggregate level determinants on one or more general population health outcomes in high-income countries were selected out of an original yield of 7353. To assess in which combinations and to what extent individual (or thematically linked) determinants had been studied together, we performed multidimensional scaling and cluster analysis.

Results:

Life expectancy and overall mortality were the most widely used population health indicators, while determinants came from the broad categories of healthcare, culture, politics, socio-economics, environment, labor, fertility, demographics, life-style, and psychology. The family of regression models was the predominant statistical approach. Results from our multi-dimensional scaling showed that a relatively tight core of determinants have received much attention, whereas most others were studied in very limited contexts. We consider research findings inconclusive at this time: across a multitude of model specifications, different country samples, and varying time periods, effects fluctuated between statistically significant and not, and between beneficial to health and detrimental.

Conclusions:

We conclude that the quest to understand the underlying mechanisms of population health is far from over and the present state of research on the topic leaves much to be desired. It seems essential that future research always considers multiple factors simultaneously and takes advantage of more sophisticated methodology.

Key messages:

- Provides a broad overview of the current state of research on the topic of determinants of population health in high-income countries.
- Employs an innovative approach examining the degree to which context has been taken into account, as a basis for future research.

Community based approach to address health disparities among Roma in North Macedonia

Borjan Pavlovski

B Pavlovski[1], *J Frishchikj*[1]
[1]Public Health Program, Association for Emancipation, Solidarity and Equality of Women - ESE, Skopje, Macedonia
Contact: bpavlovski@esem.org.mk

Issue:

Roma represent vulnerable group regarding health and health outcomes. Most health research and policies perceive Roma as a coherent group, although there are disparities within different subgroups. This is due to social determinants of health and other causes. Perceiving Roma community as monolith group may result in provision of activities for persons that don't have need and leaving behind the vulnerable. Situation is similar with other marginalized and vulnerable populations.

Description:

In 2016 started community based intervention including social accountability and legal empowerment regarding coverage,quality of health services and health rights violation. Work conducted in ShutoOrizari municipality with estimated 30.000 Roma. In 4 localities where most vulnerable Roma live, each comprised of 200 households. 2 persons from Roma NGOs and 4 community members work as team in 1 locality. Mapping of the community conducted and community inquiry. Findings shared with the community members. Findings used to conduct education of community and toconduct advocacy on local and national level with community participation in 2018for improvement of coverage and quality of services.

Results:

Approach identified disparities among Roma.1256 persons surveyed from 4 localities. 4 localities have high unemployment rate (above 70%),monthly income related to the locality ($p < 0.0002$). Disparities in health and access to health services among localities noted. Self-reported health status is related to locality($p < 0.002$). Coverage with health services also,including having registered gynecologist($p < 0.001$),regular gynecological examinations($p < 0.00001$),antenatal care($p < 0.0003$).

Lessons:

Identifying needs among Roma living in smaller localities enables tailoring of health interventions based on needs. Identification of the problems on micro level is relevant for the community concerned,increasing their involvement in demanding improvement and advocacy.

Key messages:

- Working in strictly defined localities/groups from Roma communities provides accurate insight in the health related issues.
- Working with defined localities/groups enables greater involvement of the community in advocacy for fulfillment of their rights.

Mapping perspectives of inhabitants and professionals in deprived neighborhoods in the Netherlands

Charlot Lugtigheid

JAJ Dierx[1]
[1]Research Group Living in Motion, Avans Hogeschool, Breda, Netherlands
Contact: ce.lugtigheid@avans.nl

Background:

People living in deprived neighborhoods have been shown to have several social and health problems such as loneliness, feelings of unsafety, poor diet and overweight, resulting in more sick years (16 years) and shorter life expectancy (6 year; Buck & Maguire, 2015; Murtin et al., 2017). Interventions developed by professionals to reduce health inequalities, seem to have little long term effects possibly due to interventions not matching the perspectives of people in deprived neighborhoods. The present study is performed to map possible differences in perspectives between inhabitants and professionals in deprived neighborhoods using the Triple-I method.

Methods:

The Triple-I method as qualitative research tool (Boonekamp, Dierx & Jansen, in publication) was used to gain insight in how inhabitants ($N = 12$) and health and social professionals ($N = 18$) percieve the deprived neighborhood. Inhabitants and professionals were in separate Triple-I sessions that all took place in a community center within the neighborhood.

Results:

Results show that both inhabitants and professionals want to create more self-reliance of the inhabitants. However, professionals mention their skills in organizing and bringing logic in the actions of inhabitants whereas inhabitants mention their own ability to organize activities themselves. In addition where both mention 'togetherness' as topic, inhabitants refer to this as 'meeting each other', whereas professionals talk about 'constructing powerful networks with inhabitants and other professionals'. According to professionals these networks can 'create feelings of safety', which inhabitants perceive as a result of 'clean and green surrounding'.

Conclusions:

This research corroborates the suggestion that professionals and inhabitants percieve their neighborhood differently. Interventions reducing health inequality might be more effective when approached from the perspective of and even developed and executed by the target group.

Key messages:

- Triple-I method is useable in asset mapping of inhabitants and professionals in deprived neighborhoods in the Netherlands.
- Triple-I mehtod is useable in stimulating physical activities and health in neighborhoods.

Equality of Opportunity and Mortality in Europe

Alexi Gugushvili

A Gugushvili[1]
[1]Department of Social Policy and Intervention, University of Oxford, Oxford, UK
Contact: alexi.gugushvili@spi.ox.ac.uk

Background:

This study investigates if intergenerational equality of opportunity is linked to mortality in 30 European countries. Equality of opportunity may lead to greater returns on health investments, and, consequently, improvement of health outcomes. In turn, a perceived lack of fairness in the distribution of life chances and limited possibilities for upward intergenerational mobility can cause anxiety among individuals and gradually compromise their health.

Methods:

We used information on parents' and their 163,467 children's Socio-Economic Index of Occupational Status from a large survey data-set to generate three complementary measures of equality of opportunity and linked them to administrative data on total, gender- and cause-specific mortality rates derived from the national statistical offices.

Results:

We found that lower equality of opportunity, measured by the attainment of individuals from the lowest and highest quartiles of socio-economic status and by the overall intergenerational correlation in socio-economic status, was related to higher mortality rates, particularly in relation to diseases of the nervous system and the sense organs, diseases of the respiratory system, and external causes of mortality. Our measures of equality of opportunity were more consistently linked with mortality of men than women.

Conclusions:

Equality of opportunity may be an important explanation of mortality that warrants further research. Measures that aim at facilitating intergenerational social mobility can be justified, not only due to normative considerations of equality of opportunity, but also in terms of individuals' chances to enjoy healthy lives.

Key messages:

- Intergenerational equality of opportunity was more consistently linked to mortality of men than that of women.
- Our key message is that equality of opportunity is not only fair but it is also good for health.

Exploring social inequalities in the use and experience of prenatal care in Brussels

Claudia Schönborn

C Schönborn[1]*, J Racape*[2]*, M Sow*[1,3]*, M De Spiegelaere*[1]
[1]Department of Health Policy and Health Systems Research, Brussels Free University, School of Public Health, Brussels, Belgium
[2]Department of Epidemiology and Biostatistics, Brussels Free University, School of Public Health, Brussels, Belgium
[3]School of Public Health, Montreal University, Montreal, Canada
Contact: claudia.schoenborn@ulb.ac.be

Background:

The underlying mechanisms of perinatal health inequalities remain under-researched. A possible explanation is inadequate access to healthcare services and suboptimal care for certain groups. To explore this, our study analyses the mothers' prenatal care trajectories and experiences of care in relation to socioeconomic and migration characteristics.

Methods:

A survey of 750 migrant and non-migrant mothers interviewed in 4 maternity wards in Brussels. Based on the adaptation of the Migrant-Friendly Maternity Care Questionnaire, the survey focuses on mothers with a Belgian, North African (NA) and Subsaharan African (SSA) nationality. The data are analysed through descriptive statistics and logistic regression.

Results:

This ongoing survey has a high response rate (83%). Preliminary subsample analyses ($n = 276$) show that the socioeconomic profiles of mothers vary substantially depending on nationality, with mothers from NA generally having a lower level of education, and mothers from SSA being strongly at risk of poverty. SSA women are particularly at risk of starting prenatal care late (32% compared to 4% of Belgians and NAs) and of having less than 7 recommended consultations (25% compared to 6% Belgians and 9% NAs). Low household income and maternal education were also strong predictors of late and infrequent prenatal care. Women from all three nationality groups had the same rate (10%) of planned C-sections, but women from SSA were much more likely to have an emergency c-section (16% vs 7% of Belgians and NAs). Women with a higher household income were less likely to have a c-section at all. Women from both NA and SSA were less likely to always have understood the information given by healthcare professionals. 90% of women with secondary school education understood all the information, compared to 60% of women without it.

Conclusions:

Women's care trajectories and experiences of care vary strongly depending on their nationality and socioeconomic situation.

Key messages:

- North African and Subsaharan African immigrants in Brussels live in different socioeconomic situations. Their care trajectories and experiences of care also show important differences.
- Socioeconomic characteristics, in addition to women's migration status, are important factors affecting women's perinatal care.

Gender inequality in self-reported health and its evolution in Europe between 2004 and 2016

Luis Roxo

L Roxo[1]*, J Perelman*[2]
[1]Escola Nacional de Saúde Pública, Universidade NOVA de Lisboa, Lisbon, Portugal
[2]Centro de Investigação em Saúde Pública, Escola Nacional de Saúde Pública, Universidade NOVA de Lisboa, Lisbon, Portugal
Contact: lf.roxo@ensp.unl.pt

Background:

That women generally have worse health than men has long been shown. Yet, the situation in Europe might have changed recently. Gender inequalities have decreased in access to education, employment, and political representation. However, women have increasingly adopted traditionally masculine unhealthy behaviors, such as smoking. Also, the

Great Recession may have hurt women harder, due to their greater socioeconomic vulnerability. This study aims to analyze gender inequalities in 30 European countries, and its evolution over the 2004-2016 period.

Methods:

We used data from the Survey on Income and Living Conditions (SILC), from people between 25 and 64 years old (N = 3,109,150). We modeled the probability of bad/very bad self-reported health as function of gender, adjusting for age, country and year, using logistic regressions. We further adjusted for education and employment. Then, we included interactions of gender and year to test changes in inequalities over time. Finally, we stratified the analysis according to countries grouped based on the Gender Development Index (GDI).

Results:

Women were 16.8% more likely to report bad health (OR = 1.17, $p < 0.01$). Considering education and employment, women were 2.6% less likely to report bad health (OR = 0.97, $p < 0.01$). Over time, adjusting for age, the gender gap reduced from 81.1% (OR = 1.81, $p < 0.01$) in 2004 to 16.4% in 2016 (OR = 1.16, $p < 0.01$), and from 31.5% to 2.5% with socioeconomic adjustment. The reduction was larger in countries with a greater GDI.

Conclusions:

Gender inequality has decreased, but was still present in 2016, in favor of men. This thinning is partly explained by the narrowing of inequalities in education and employment. A greater GDI has favored a larger improvement.

Key messages:

- Gender inequalities in self-reported health have narrowed over 2004-2006, following the narrowing of socioeconomic inequalities.
- A greater GDI has favored a larger improvement in gender inequalities.

Food insecurity and social determinants of students' low adherence to the Mediterranean diet

Thomas Tsiampalis

T Tsiampalis[1], *A Petralias*[1,2], *A Linos*[1,3]
[1]Institute of Preventive Medicine, Environmental & Occupational Health, Prolepsis, Maroussi, Greece
[2]Department of Statistics, Athens University of Economics and Business, Athens, Greece
[3]Department of Hygiene, Epidemiology and Medical Statistics, Medical School, National and Kapodistrian University of Athens, Athens, Greece
Contact: t.tsiampalis@prolepsis.gr

Background:

Despite the fact that the Mediterranean diet is highly beneficiary for people's health, there are many factors which cause disparities in the level of adherence. The aim of the present work was to investigate the effect of household food insecurity (FI) on adherence to the Mediterranean diet (AMD), to explore the participants' characteristics modifying the studied relationship and find the social determinants of students' low adherence to the specific dietary pattern.

Methods:

A cross-sectional study with 140 schools and 4,242 students was conducted in Greece (2017-2018). Especially designed and validated instruments were used to record students' sociodemographic characteristics, household's FI status and students' AMD. Analysis of Variance (ANOVA) and Covariance (ANCOVA) was used to investigate the effect of FI and to identify the significant social determinants of students' AMD, according to students' school grade.

Results:

After adjusting for other characteristics, students whose both parents are born in other countries, spend at most 4 hours/week on TV/electronic games, live in the regions of Peloponnese, Central Macedonia or Attica and attend primary schools adhere more to the Mediterranean diet, while higher level of physical activity and lower FI are significantly associated with better AMD. Parents' educational level in nursery schools ($p = 0.002$) and employment status in nursery schools ($p = 0.012$) and in high schools/ lyceums ($p = 0.008$) were found to modify significantly the studied relationship in the univariate analysis, while school grade ($p = 0.013$) and physical activity ($p = 0.088$) were found to modify the studied relationship in the multivariable analysis.

Conclusions:

Several demographic, socioeconomic and lifestyle characteristics were significantly associated with students' AMD. Thus, emphasis should be given on the design of special programs to reduce household FI and intervene in the rest characteristics.

Key messages:

- Researchers and policymakers should consider food insecurity as important risk factor for school-aged children, particularly for those who live in poverty.
- Emphasis should be given on the design of special low-cost programs aiming to reduce food insecurity.

Intercultural opening: participant observation in two hospitals and two outpatient care services

Lisa Peppler

L Peppler[1], *PT Sonntag*[1], *L Schenk*[1]
[1]Institute for Medical Sociology and Rehabilitation Science, Charité University Medicine, Berlin, Germany
Contact: lisa.peppler@charite.de

Background:

The German healthcare system is facing intercultural diversity, since numerous migrant patients, nurses, and doctors are involved. This raises the question as to what extent everyday processes, working cultures and institutional framework conditions change because of this and how intercultural healthcare can be improved.

Methods:

The participant observation took place on 22 days during summer 2018 in two outpatient care services and two hospitals, which show different degrees of intercultural opening (e.g. more or less migrant employees and patients). The aim was to reconstruct the daily work routine of health staff as well as the patients' daily routine. The anonymized records include meetings, care tours, handovers and visits. The observation protocols were analyzed by documentary method and compared on two levels: degree of intercultural opening and sector affiliation.

Results:

The results show that intercultural opening has a sector-specific impact on organization and daily work processes. The health staff of the hospital with high intercultural opening showed routine handling and relaxed reactions to communication difficulties due to the regular care of migrant patients, whereas that of the hospital with low intercultural opening showed stress-related defensive stance due to rare cases. The situation in the outpatient sector is different: The care of migrant patients was perceived to be more costly in the institution with high intercultural opening, because the migrant employees repeatedly perform additional socio-educational work that is not covered by insurance.

Conclusions:

The migration-specific knowledge of employees has a positive effect on patient care in both inpatient and outpatient sector. However, this may be financially disadvantageous for nursing services under the conditions of outpatient care.

Key messages:

- Synergy effects arise from the involvement of migrant health workers and the care of migrant patients.
- Framework conditions must support these synergy effects in order to improve cultural sensitive healthcare.

1.B. Skills building seminar: How to include migrant and refugee populations health monitoring and surveillance in Europe

Organised by: Robert Koch Institute
Chair persons: Claudia Santos-Hövener - Germany, Nicole Rosenkötter - EUPHA (PHMR)
Contact: Santos-HoevenerC@rki.de

Objectives:

The level of diversity in most European societies is increasing, especially due to ongoing migration to and within Europe. Migrants are very heterogeneous in terms of reasons for migration, region of origin and chances in the countries of destination and thus, differ greatly in regards to health resources and risks. It is crucial to gain valid data on migrant health status to inform policy makers in order to plan, implement and adjust health interventions and services. This highlights the importance of including migrant populations into health monitoring and surveillance. The objective of this workshop is 1) to demonstrate the importance of including migrants into health surveys, 2) to describe barriers that might hinder migrants from participating, 3) to critically appraise the strategies being used to include migrant populations and 4) to give clear recommendations on how to assure the responsiveness of migrant populations in health monitoring and surveillance. Three countries will present how they reach migrants with national health surveys and focus on selected strategies that increase accessibility of migrant groups. These approaches may include innovative sampling strategies, ways to bridge language gaps and enhancing participation of migrant groups in developing and conducting surveys. We will focus on different migrant groups, including refugees as a particularly vulnerable population. Following the presentations we will have enough time to discuss these strategies in terms of transferability and cost in order to synthesize ideas, learn from each other and discuss pitfalls and lessons learned.

Main messages:

Europe is diversifying, and it is thus crucial to capture migrants' health in health monitoring and surveillance. The national public health institutes are in charge of ensuring sufficient representation of migrant populations in health surveys and to tackle potential barriers. Cross-country collaboration allows sharing successful strategies.

Key messages:

- In a diversifying Europe, it is crucial to include migrant populations into health monitoring and surveillance.
- Approaches include include innovative sampling strategies, ways to bridge language gaps and enhancing participation of migrant groups in developing and conducting surveys.

Collecting high-quality survey data on hard-to-reach populations: lessons from Finland

Shadia Rask

S Rask[1], P Koponen[1], N Skogberg[1], H Kuusio[1], A Castaneda[1]
[1]THL, Helsinki, Finland
Contact: shadia.rask@thl.fi

Issue:

Hard-to-reach populations refer to groups that may be difficult to involve in research. Minorities and persons with migration background (PMB) are often underrepresented in population-based surveys. This may lead to serious bias. Description of the problem: Several surveys on the health and wellbeing of hard-to-reach populations have been conducted in Finland since 2010. Strategies for collecting high-quality data have been identified in five surveys focused on specific migrant groups (Maamu n = 3000), the foreign-origin population (UTH n = 6000; FinMONIK n = 13650), newly-arrived asylum seekers (TERTTU n = 1087) and Finnish Roma (ROOSA n = 365). Also few routinely collected studies include indicators of ethnic background or origin (e.g. School Health Promotion study).

Results:

Country of birth and foreign origin can be identified in Finland using register-based sampling. Snowball sampling was needed for the Roma population. Strategies to reach participants included information dissemination, translated questionnaires, multilingual personnel, telephone contacts and door-to-door visits. Stakeholders and participants were involved in planning and reporting. Participation rates as high as 70-80% were reached from register-based samples. Lessons: High-quality survey data can be collected on hard-to-reach populations. This requires adequate resources including multilingual personnel and researcher-participant trust. The cross-cultural validity of survey questions is critical; cognitive interviews can be used to improve cultural sensitivity. Researchers should be sensitive of sense of belonging, e.g. PMB may object being seen as "migrants". Members of hard-to-reach populations should be involved in research, and not merely objects of a study.

Main messages:

High participation rates can be achieved with adequate time, financial resources and established researcher-participant trust. Data collection should be inclusive and clearly benefit the individuals and populations in concern.

The IMIRA (Improving Health Monitoring in Migrant Populations) - project in Germany – Lessons learned und implications for health monitoring

Claudia Santos-Hövener

C Santos-Hövener[1], M Schumann[1], P Schmich[1], A Gößwald[1], U von Schenck[1], T Lampert[1]
[1]RKI, Berlin, Germany
Contact: Santos-HoevenerC@rki.de

Background:

A quarter of the population living in Germany are people with a migration background (PMB). In this context, the Robert Koch Institute (RKI) has the task of designing the health monitoring system that has been established in recent years in such a way that PMB are adequately taken into account in statements on the health situation of the German population.

Methods:

The Improving Health Monitoring in Migrant Populations (IMIRA) project was initiated at the end of 2016 with the aim of improving the inclusion of MMH in health monitoring. Literature research, expert interviews and feasibility studies were carried out to identify strategies for access routes, recruitment measures, the dismantling of language barriers and the inclusion of MHH, which are incorporated into the concept of Monitoring 4.0, the further development of RKI health monitoring.

Results:

In order to sustainably improve the accessibility of PMB in RKI health monitoring, a sequential study design with multilingual administration modes is planned within interview surveys. Personal contact through home visits and face-to-face interviews as well as the use of interpretation are essential to increase the willingness to participate. Strengthening the diversity sensitivity of the staff, as well as anti-discriminatory reporting, and promoting the participation of PMB and practitioners are additional components.

Conclusions:

The IMIRA project has led to important findings that will be implemented in the long-term health monitoring of the RKI.

The improved accessibility of PMB for health surveys enables a reflected presentation of the health situation of PMB, which does justice to the heterogeneity of the population living in Germany.

Main messages:

- In order to include PMB sustainably in health monitoring we need to, develop dynamic study designs, bridge language gaps, establish personal contact, increase diversity sensibility and encourage participation of PMB in development of research processes.

1.D. Global health and migration

Dyslipidaemia among Ghanaian migrants in Europe and their compatriots in Ghana: the RODAM Study

Eva van der Linden

EL van der Linden[1,2], *C Agyemang*[1]
[1]Department of Public Health, Amsterdam UMC, Amsterdam, Netherlands
[2]Department of Internal Medicine, Amsterdam UMC, Amsterdam, Netherlands
Contact: e.l.vanderlinden@amsterdamumc.nl

Background:

Sub-Saharan African (SSA) populations are believed to have a favourable lipid profile compared to European populations. However, geographical differences in the lipid profile of a homogenous SSA population residing in different geographical locations have not yet been assessed.

Methods:

We used data from the multicentre, cross-sectional RODAM study including Ghanaian adults residing in rural and urban Ghana and in London, Amsterdam and Berlin (n = 5482). Dyslipidaemias were defined based on the 2012 European Guideline on Cardiovascular Prevention. The age-adjusted prevalence of dyslipidaemias was compared between the sites using prevalence ratios (PRs) adjusted for lifestyle and dietary covariates in different models.

Results:

The age-standardised prevalence rate of high total cholesterol (TC) and LDL-cholesterol (LDL-C) was lower in rural than in urban Ghana and Ghanaian migrants in Europe. Adjusted PRs of high TC and LDL-C were higher in urban Ghana (TC PR = 2.15, 95% confidence interval 1.69-2.73) and Ghanaian migrant men (TC PR = 2.03 (1.56-2.63)) compared to rural Ghana, but there was no difference between rural and Ghanaian migrant women (TC PR = 1.01 (0.84-1.22)). High triglyceride levels were as prevalent in rural Ghana (11.6%) as in urban Ghana (12.8%), but were less prevalent in Ghanaian migrant women (2.0%). In both sexes, low HDL-cholesterol was most prevalent in rural Ghana (50.1%) and least prevalent in Europe (12.9%).

Conclusions:

The lipid profile of Ghanaians varied by geographical location, and differential gradients of the individual dyslipidaemias could be observed between the locations. Additional research is needed to identify factors driving these differential risks in order to assist prevention efforts.

Key messages:

- The lipid profile of Ghanaians in urban Ghana and Europe is less favourable compared to the lipid profile of rural Ghanaian residents.
- Substantial differences in lipid profiles could be observed between the geographical locations.

Metabolic syndrome among Ghanaian migrants and their homeland counterparts: the RODAM study

Eva van der Linden

EL van der Linden[1,2], *C Agyemang*[1]
[1]Department of Public Health, Amsterdam UMC, Amsterdam, Netherlands
[2]Department of Internal Medicine, Amsterdam UMC, Amsterdam, Netherlands
Contact: e.l.vanderlinden@amsterdamumc.nl

Background:

Metabolic syndrome (MetSyn) is a major risk factor for type 2 diabetes (T2D) and cardiovascular disease (CVD). T2D and CVD are a major burden among African populations both in Africa and in high-income countries. However, it is unknown whether the prevalence of MetSyn shows geographical differences between a homogenous population residing in different settings in Africa and Europe.

Methods:

We used data from the cross-sectional multi-centre Research on Obesity and Diabetes among African Migrants (RODAM) study that was conducted among Ghanaians aged 25-70 years residing in rural and urban Ghana and in Amsterdam, London and Berlin (n = 5659). MetSyn was defined according to the 2009 harmonized definition. Geographical locations were compared using age-standardised prevalence rates and prevalence ratios (PRs), adjusted for age, education, physical activity and smoking.

Results:

In men, the age-standardised prevalence of MetSyn was 8.3% in rural Ghana and showed a positive gradient through urban Ghana (23.6%, PR = 1.85, 95% confidence interval 1.17-2.92) to Europe, with the highest prevalence in Amsterdam (31.4%; PR = 4.45, 2.94-6.75). In women, there was a rural to urban gradient in MetSyn prevalence (rural Ghana 25%, urban Ghana 34.4%, PR = 1.38, 1.13-1.68), but small differences in MetSyn prevalence between urban Ghanaian and European Ghanaian women (Amsterdam 38.4%). The prevalence rates of the individual MetSyn components showed a positive rural-urban-Europe gradient. However, compared to their urban and European counterparts, a low HDL-C level was significantly more prevalent among rural Ghanaians.

Conclusions:

MetSyn and its components are highly prevalent in Ghana as well as in Ghanaian migrants in Europe. To understand the mechanisms driving the geographical differences in MetSyn, further research is needed, thereby aiming for the reduction of T2D and CVD prevalence in SSA populations.

Key messages:

- Metabolic syndrome is more prevalent in urban compared to rural Ghana, and even more prevalent in Ghanaian migrants in Europe.
- Its components show the same positive gradient, expect for low HDL-C, which shows a negative gradient.

Hyperuricemia And Estimated Cardiovascular Risk Among Migrant and non-migrant Africans

Felix Chilunga

C Agyemang[1], *MAM Mannens*[2], *P Henneman*[2], *E Beune*[1], *K Meeks*[1], *A Requena-Mendez*[3]
[1]Department of Public Health, Amsterdam UMC, Amsterdam, Netherlands
[2]Department of Clinical Genetics, Amsterdam UMC, Amsterdam, Netherlands
[3]ISGLOBAL, University of Barcelona, Barcelona, Spain
Contact: f.p.chilunga@amc.uva.nl

Objective:

In the advent of rapid urbanization, migration and epidemiological transition, the extent to which serum uric acid (sUA) affects cardiovascular disease (CVD) risk among Africans is not well understood. We assessed differences in sUA levels and associations with estimated CVD risk among migrant Ghanaians in Europe, and non-migrant Ghanaians in rural and urban Ghana.

Methods:

Baseline data from 633 rural, 916 urban and 2315 migrant RODAM study participants (40-70 years) were analyzed. Hyperuricemia was defined as sUA >7mg/dl in males and >6mg/dl in females. Elevated CVD risk was defined as pooled cohort equation estimates $\geq$ 7.5%. Logistic regressions were used to assess differences in hyperuricemia and associations with estimated CVD risk. Receiver operator curves were used to calculate sUA cut off values that maximised likelihood of elevated CVD risk.

Results:

Prevalence for hyperuricemia in rural, urban and migrant participants were 17.4%, 19.1% and 31.7% for men, and 15.9%, 18.2% and 33.2% for women, respectively. Hyperuricemia was positively associated with elevated CVD risk among rural residents(adjusted OR for men 2.88, 95%CI, 1.20-6.88, 5.32, 95%CI, 2.86-9.95 for women), urban residents(1.26, 95%CI, 0.59-2.69 for men, 2.41, 95%CI, 1.56-3.73 for women) and migrants(2.39, 95%CI, 1.57-3.64) for men, 3.74, 95%CI, 2.78-5.02 for women). SUA cut-off values were 6.8mg/dl in men and 5.2mg/dl in women.

Conclusions:

Our study shows variations of sUA levels in different African contexts. Hyperuricemia is associated with elevated estimated CVD risk in both migrants and non-migrants. Further studies should identify factors driving associations between SUA and CVD risk in Africans.

Key messages:

- Hyperuricemia is a risk factor for cardiovascular risk in both migrants and non-migrants.
- Cardiovascular risk is seen at low levels of serum uric acid levels in Africans.

''Queer Migrants Welcome'' in Public Health Teaching

Yudit Namer

Y Namer[2], H Tezcan-Güntekin[1]
[1]Alice Salomon University of Applied Science, Berlin, Germany
[2]School of Public Health, Bielefeld University, Bielefeld, Germany
Contact: yudit.namer@uni-bielefeld.de

Background:

People with heterogeneous sexual orientations and gender identities are rarely the focus of public health research or teaching. LGBTQ people (Lesbian, Gay, Bisexual, Transgender, Queer) are particularly at risk of being discriminated against in accessing and using health care. In order to give students of public health a perspective that is sensitive to diversity and which will allow them to consider LGBTQ people in their future research, teaching and practice, these topics must be actively reflected on during their studies.

Methods:

A website was built by a team of students of the Bachelor degree program in Health Communication at the School of Public Health, Bielefeld University in Germany. The aim of this course was to learn about the health situation and risks of LGTBQ people. One main emphasis of this project was to develop a medium that focuses on the perspective for newcomers, migrants and refugees in the context of LGTBQ health in a participatory way.

Results:

The students developed an understanding of LGBTQ, migration and health largely independently through individual research and group discussion, decided to create an English-language website (https://queermigrantswelcome.jimdofree.com) and present existing findings in blog posts they wrote on their own. The pictures on the homepage were drawn by the students themselves, as they perceived the freely available LGBTQ pictures as too stereotypical. They contacted counselling centres for LGBTQ persons throughout Germany and asked in which language they offer counselling and have included these counselling possibilities on the homepage.

Conclusions:

Already at the Bachelor's level, students can design innovative media that can improve the health care of marginalized people and contribute to the dismantling of discriminatory structures. It is important that the students are given sufficient freedom to make their own decisions and identify with the topic, thus facilitating a major learning process.

Key messages:

- Desiderates in health communication can be reduced by well accompanied student projects.
- The topic LGBTQ must be implemented in the curricula of public health study programmes to reduce discrimination in health care.

Vaccination status of migrant populations in EU/EEA countries and implications for VPD control

Sally Hargreaves

S Hargreaves[1], J Himmels[1], LB Nellums[1], E McGuire[1], JS Friedland[1]
[1]Institute for Infection and Immunity, St George's University of London, London, UK
Contact: s.hargreaves@sgul.ac.uk

Background:

Migrant populations in the EU/EEA are increasingly being associated with outbreaks of vaccine-preventable diseases (VPDs), including the large-scale measles outbreak currently ongoing across Europe; however, it is unclear to what extent migrants represent an under-immunised group in the European context and implications for VPD control. Ensuring high levels of vaccination coverage is a key priority for all countries through the European Vaccine Action Plan, with EU/EEA Member States committed to eliminating measles and rubella, sustaining polio-free status, and controlling hepatitis B infection. We synthesised existing EU/EEA data to assess under-immunisation in migrants (defined as foreign born) residing in EU/EEA countries.

Methods:

We did a systematic review and meta-analysis (PROSPERO CRD42018103666) in accordance with PRISMA guidelines. Inclusion criteria were primary research studies pertaining to vaccination status (measles, mumps, rubella, diphtheria, tetanus, pertussis, polio and Haemophilus influenzae type b [Hib]) in migrants residing in all EU/EEA countries. Pooled prevalence (95% CIs) were calculated for the meta-analysis using a random effects model.

Results:

56 studies met our criteria (14 EU/EEA countries); 36 studies, which included data from 80,432 migrants, were included in the meta-analysis. Vaccination status of migrants for key VPDs varied substantially, with pooled immunisation coverage well below the herd immunity threshold (HIT) targets for measles 80% (95% CI: 73-87%; HIT 92-95%), mumps 65% (95% CI: 48-82%; HIT 75-86%), and diphtheria 51% (95% CI: 29-73%; HIT 83-86%). Polio type 1 and 2 coverage was high (97% [95% CI: 95-98%]; 95 [95% CI: 92-97%], respectively).

Conclusions:

Migrants represent an under-immunised group in Europe, thus a high priority group for catch-up vaccination. Innovative strategies to engage them in vaccine uptake will be critical if we are to make European targets for the elimination and/or control of key VPDs.

Key messages:

- Migrants represent an under-immunised group in Europe and a high priority group for catch-up vaccination campaigns.
- Innovative strategies to engage them in vaccine uptake will be critical if we are to make European targets for the elimination and control of vaccine-preventable diseases.

1.E. Workshop: Comparative Public Health: Politics, science, and professionalism

Organised by: University of Michigan
Chair persons: Marleen Bekker - EUPHA (PHPP), Karine Chevreul - France
Contact: slgreer@umich.edu

Look around EUPHA, or any other public health conference. Public health is difficult to define, in theory and in practice. Its boundaries are all blurred, whether with medicine, schools, environmental protection or workplace safety inspectorates. Too often, we overstate the similarities between public health systems among countries. Efforts to promote networks, good practice, and even basic coordination have been undermined for decades by misunderstandings born of different educational, organizational, financial and political systems. The lack of comparison, and comparative political analysis in particular, also means that countries can have very similar debates about the proper nature and scope of public health, an about who is to blame for deficiencies, without awareness of when they are distinctive and when they are actually part of larger trends.

This project aims to identify and explain variation in the scope and organization of public health systems in selected high-income countries. Based on a formalized comparative historical analysis of Austria, France, Germany, Poland, the United Kingdom and the United States, researchers in the study first mapped the various axes of divergence: workforce composition, organization, levels of government, relationship to medicine, and the extent to which public health encompassed adjacent areas such as environmental health and occupational health and safety. For each country we then followed both case studies (communicable disease control including vaccines, HIV/AIDS, tobacco control, diet and nutrition, occupational health and safety) as well as the legislative history of the public health field in order to identify its changing organization and scope. It then identifies the relative role of historical legacies, changing science, burden of disease and politics in explaining patterns of both divergence and convergence.

This workshop presents four country specific case studies (France, Germany, United Kingdom and the United States) that identify the most important forms of variation and the political, scientific and professional drivers of convergence and divergence.

Key messages:

- Political organization and scope as images of public health are grossly under-researched and nonexistent in a comparative nature.
- Understanding the scope and organization of public health in different countries will permit better lesson-drawing and identification of relevant and effective levers of change.

France: A Public health system built on competing paradigms

Sarah Rozenblum

S. Rozenblum[1]
[1]Health Management and Policy, University of Michigan, Ann Arbor, USA
Contact: srozen@umich.edu

Background:

Although France helped establish public health as a scientific discipline, it is well known that the country was slow to implement public health measures on a national scale. The central government played a limited role in public health until the second half of the 20th century. Public health became a privileged space for political action in the 1990s, as a direct outcome of the ''blood crisis'' and a series of other health ''scandals''.

Methods:

A comparative historical analysis (CHA) based on government documents, law, and secondary sources.

Results:

Between the early 1990s and 2016, France saw the emergence of two competing understandings of public health. It was legally defined as a responsibility of the state to protect its population against disease risks and to ensure equal access to and representation in the healthcare system, captured by the notions of sécurité sanitaire (''health security'') and démocratie sanitaire (''health democracy''). Public health actions framed in the language of ''security'' changed its place in the hierarchical structure of the state. It both reinforced public health as a legitimate field of intervention (now presented as an important function of government, similarly to finance, foreign affairs, defense, etc.) and reinforced the central state, as the legitimate protector of population health and provider of public health services. The French public health arena also witnessed the (re)emergence of local and private actors, motivated by their own interests and competing understanding of public health.

Germany: The reformation of public health

Michelle Falkenbach

M. Falkenbach[1]
[1]Health Management and Policy, University of Michigan, Ann Arbor, USA
Contact: michfalk@umich.edu

Background:

Germany was amongst the most successful advocates and implementors of public health ideas in the 19th and early 20th centuries. Dominated by the social hygiene theory in the early 1900s population health was a main priority. With the recognition that bacteria caused diseases in both animals and humans municipal and national public health programs peaked resulting in increased research and education in the field. With the aftermath of WWII, public health in the country seemingly disappeared until the 70s when the AIDS epidemic forced it out of hiding.

Methods:

A comparative historical analysis (CHA) based on government documents, law, and secondary sources.

Results:

Germany is still struggling to elevate public health to the same level of importance and respect that curative health enjoys. Despite its many shortcomings (limited tobacco control, the struggle to integrate public health and medicine, and the lack of recognition for public health scholars, researchers and doctors), largely due to its collapse after WWII, the German public health system can be seen as transformational in the sense that it is giving public health a new and perhaps more timely role namely that of a health advocate.

Conclusions:

Public health in Germany has undergone a number of transitions throughout the past centuries moving from a practice initially based in economic theory with the goal of improving sanitation onto being increasingly supported by eugenics and with that the policing of an entire population to finally landing in the 21st century with the intention of advocating for European level public health agencies focusing on monitoring and reporting.

The United States: A system built on fragmentation

N'dea Moore-Petinak

H. Jarman[1]
[1]Health Management and Policy, University of Michigan, Ann Arbor, USA
Contact: moorepen@umich.edu

Background:

The United States is effectively a laboratory for ways to produce public goods, such as public health, on the cheap. Its

c. 90,000 governments compete for residents, businesses, taxes, development, and jobs while also trying to compensate for the lack of universal health care coverage. They all have structural incentives to provide services as cheaply as possible. The effects are diverse and poorly mapped. They can mean innovation in organizational forms, a different and typically less expensive skill mix among the workers, poor quality, or simple under provision. The exact mix can often be hard to identify. It can also mean extreme responsiveness to funding from higher levels of government such as the states or federal government.

Methods:

A comparative historical analysis (CHA) based on government documents, law, and secondary sources.

Results:

The distinctively expansive scope of US public health actions is largely due to the country's failure to establish a universal health care system, and the diversity of US public health tasks reflects local adaptation of tens of thousands of governments. This means that public health in the United States retains much of the activity it had in, for example, the UK before the establishment of the US. In particular, and even in states that accepted the Medicaid expansion in the Affordable Care Act (ACA), local public health departments provide a substantial amount of direct care and fill in for gaps in health care provision.

Conclusions:

The US public health system is highly fragmented like the governments that run it, and therefore diverse. Reflecting the failures of the US health care system, it carries out many more tasks that in other countries are seen as health, especially primary, care.

The politics of public health in the United Kingdom between medical, social, and local

Scott Greer

S. Greer[1]
[1]Health Management and Policy, University of Michigan, Ann Arbor, USA
Contact: slgreer@umich.edu

Background:

Public health in the UK exists on a continuum from a national and medical pole to a local and social pole, with each end threatening obliteration as a distinctive field of expertise and action. The national-medical produces a subfield of medicine, with a range of highly developed skills including epidemiology. The local-social, manifested in social medicine as well as equivalent approaches in social work, education, and local government, produces health, which need not be medical, as a result of investment in integrated services that enable solidary, dignified communities. This model is more invested in local communities and local governments, and more likely to blur borders with social work, leisure, and other areas, and have an overtly social democratic ethics and set of arguments.

Methods:

A comparative historical analysis (CHA) based on government documents, law, and secondary sources.

Results:

Public health in the UK has changed shape many times, from the end of most formal public health between 1948 and 1974, to the creation of a public health function in the 1980s, to the moment of divergence in 2012 when England reverted to a local public health and the devolved administrations did not.

Conclusions:

The scope of public health might formally be the causes of avoidable ill health. In practice, the accepted expertise and autonomy of public health is found in narrower areas related to medicine: communicable disease control, health education, a few social services such as outpatient and outreach mental and sexual health, and the search for politically acceptable policies to address NCD threats. With public health moved to local government in England, its relationship with the NHS and medicine is likely to weaken further, to the likely detriment of the formal public health function and public health.

1.F. Predictors of adolescent health and well being

Effectiveness of school-based interventions to prevent anxiety & depression in young people

Deborah Caldwell

D. Caldwell[1]
[1]Centre for Public Health, Bristol Medical School, University of Bristol, Bristol, UK
Contact: D.m.caldwell@bristol.ac.uk

Background:

The prevalence of anxiety and depression is increasing among children and young people (CYP). Evidence suggests 1/2 of mental illness is apparent by age 14 and 3/4 by early adulthood. Globally, there is growing interest in prevention of anxiety and depression in CYP.

Methods:

We report the findings from a systematic review and network meta-analysis (NMA) of school-based interventions to prevent anxiety and depression in CYP. NMA enables the simultaneous comparison of multiple interventions in a single evidence synthesis, retaining the identity of each intervention analysed and ranking of interventions according to the probability that each is best for a given outcome. Bayesian analyses were conducted in OpenBUGS, & random effects NMA were conducted for the primary outcomes of post-intervention self-report anxiety and depression.

Results:

NMA were conducted for universal and targeted populations, in primary, secondary & tertiary educational settings. In universal primary settings, there is no evidence that any intervention reduced depression or anxiety. In universal secondary settings, CBT & mindfulness-based interventions suggest a reduction in anxiety symptoms relative to usual curriculum but was not observed for depression symptoms. In targeted secondary settings, exercise appears effective for reducing anxiety symptoms relative to no intervention. For prevention of depression symptoms, CBT appears effective. In targeted primary settings, there is no evidence that any intervention is effective. Few tertiary institution-based interventions met our inclusion criteria.

Conclusions:

standard meta-analyses require lumping over interventions such that intervention specific effects may be masked (e.g. psychological intervention vs control). This NMA has identified the specific interventions which may prevent anxiety and depression in CYP. However, we observed considerable uncertainty and no intervention appears effective across every population and setting.

Key messages:

- Network meta-analysis enables the simultaneous comparison of multiple interventions in a single evidence synthesis, retaining the distinct identity of each intervention analysed.
- We observed considerable uncertainty for effectiveness of school-based interventions to prevent anxiety and depression. No single intervention appears effective across every population and setting.

Are lifestyle behaviors correlated to mental health disorders in medical students?

Houda Ben Ayed

H Ben Ayed[1,2], *J Jedidi*[1,2], *F Cheikhrouhou*[2], *A Ayadi*[2], *S Yaich*[1], *J Damak*[1]
[1]Community Health and Epidemiology Department, Hedi Chaker University Hospital, University of Sfax, Sfax, Tunisia
[2]Train the trainees, CONFIDE Project, University of Sfax, Sfax, Tunisia
Contact: drhoudabayed@gmail.com

Background:

Recently, there has been a renew interest to medical students' mental health, which may be influenced by several socio-demographic and cultural factors, academic overload, but also by lifestyle behaviours. This study aimed to assess the correlation between major lifestyle behaviors and mental health in medical students.

Methods:

A cross-sectional questionnaire survey was conducted among 521 medical students randomized from different levels, at Southern Tunisia Medical School, 2017. The 12-item General Health Questionnaire (GHQ-12) and the Simple Lifestyle Indicator Questionnaire (SLIQ) were used to assess mental health and lifestyle, respectively.

Results:

The mean values of GHQ-12 and SLIQ were 4.1±2.8 and 6.2±1.4, respectively. According to SLIQ components, we noted an unhealthy lifestyle in 36.9%, 50.1% and 20.2% for diet, physical activities and stress level, respectively. The prevalence of psychological distress (GHQ-12$\geq$4) was 50.1%. The GHQ-12 items analysis revealed that 235 cases (45.1%) were unable to concentrate, 237 cases (45.5%) felt unhappy and depressed and 195 cases (37.4%) had a loss of sleep over worry. Low family financial situation (Odds Ratio (OR) = 1.5;95%CI = [1.1-2.3]), internship level, (OR = 1.8;95%CI = [1.1-3.3]) and medium/poor academic performance (OR = 2.2;95%CI = [1.5-3.2]) were significantly associated with psychological distress. Multivariate analysis showed that unhealthy lifestyle was independently associated with psychological distress (Adjusted OR = 5.8;95%CI = [2.4-14.8]).

Conclusions:

Our study highlighted the magnitude of psychological distress in medical students. Unhealthy life style was a potential predictive of mental disorders. These findings are extremely useful for guiding future curricular changes upon entry into medical schools.

Key messages:

- Mental disorder prevalence ranked at an alarming rate among medical students.
- Promoting healthy life style represents a reliable tool to sustain a good quality of life for the future-doctors.

Higher Education Students' Mental Health Problems: Results from the Norwegian SHOT study

Tormod Bøe

T Bøe[1,5], *M Hysing*[1], *B Sivertsen*[2,3,4]
[1]Department of Psychosocial Science, University of Bergen, Bergen, Norway
[2]Department of Health Promotion, Norwegian Institute of Public Health, Bergen, Norway
[3]Department of Research & Innovation, Helse Fonna HF, Stavanger, Norway
[4]Department of Mental Health, Norwegian University of Science and Technology, Trondheim, Norway
[5]RKBU Vest, NORCE Norwegian Research Centre AS, Bergen, Norway
Contact: tormod.boe@uib.no

Highly educated people have better health than those without education. The number of young adults pursuing higher education is increasing; In 2015 almost half the Norwegian adult population had completed higher education (1). Studies have investigated horizontal stratification (i.e. differentiation within higher education) effects on labor market outcomes, but few have studied health returns from education (2). Data stem from a recent national student health survey from 2018 for higher education in Norway (the SHoT2018-study; N = 50 054, response rate = 30.8%). We examined the associations between level of ongoing education (One-year program, Bachelor, Master, longer professional education) and mental health problems measured with Hopkins Symptoms Checklist (HSCL-25; 3. There was a pattern of decreasing symptoms of mental health problems with level of study program, F (5,49782) = 103,34, $p < .001$. The results formed a monotonic relationship; each level of increased education was associated with significantly less mental health problems. There was no difference between the Masters and professional programs. We found evidence of horizontal stratification of mental health problems in this large sample of Norwegian college and university students. The observed association may have three explanations; causality may run from schooling to health (4), it may run from health to schooling (5), or both may be determined third factors. Further studies should investigate mechanisms such as stigma and social status in relation to the observed associations (6,7).

1 OECD. (OECD Publishing, 2015), 2 Conti, G. et al. Am. Econ. Rev. 100, 234-238 (2010), 3 Derogatis, L. et al. Behavioral science 19, 1-15 (1974), 4 Grossman, Michael et al. in Handbook of the Economics of Education (eds. Eric A Hanushek & F. Welch) 1, (Elsevier, 2006), 5 Currie, J. J Econ Lit 47, 87-122 (2009), 6 Marmot, M. (Bloomsbury, 2004), 7 Hagquist, C. E. I. Eur J Public Health 17, 21-26 (2007)

Key messages:

- Increasing numbers of young adults pursue higher education, it is therefore important to investigate educational inequalities within higher education.
- College students pursuing higher education (masters or professional programs) have fewer mental health problems relative to college students enrolled in higher education, but at lower levels.

Chronic sleep deprivation and adolescent health: Two longitudinal studies of youth in Western Canada

Annalijn Conklin

AI Conklin[1,2], *CA Yao*[2], *CG Richardson*[2,3]
[1]Faculty of Pharmaceutical Sciences, University of British Columbia, Vancouver, Canada
[2]Centre for Health Evaluation and Outcome Sciences, Providence Health Research Institute, Vancouver, Canada
[3]School of Population and Public Health, University of British Columbia, Vancouver, Canada
Contact: annalijn.conklin@ubc.ca

Background:

Chronic exposure to insufficient sleep may increase depression and poor health in adolescents who are particularly vulnerable to changes in sleep and neuro-cognitive development. The cumulative effects of persistent sleep deprivation on adolescent physical and mental health, and potential gender differences, are unknown. We investigated whether cumulative sleep deprivation is linked to sub-optimal health or depression in youth (13-18 y).

Methods:

Longitudinal self-reported data (2011-2012) included three measures of sleep times and two of self-rated health (SRH) and depression (CESD). Missing data were multiply imputed using variables related to primary and secondary analyses for SRH (n = 3104) and CESD (n = 3071). Multivariable regression models with interaction terms estimated gender-specific associations; post-estimation calculated adjusted mean depression scores across levels of cumulative sleep deprivation.

Results:

We found 11% of youth (56% females) in BC were chronically sleep deprived. Cumulative exposure to sleep deprivation was not associated with SRH in adolescents (all P-values $\geq$ 0.097), but was associated with increased risk of depression in young women only. Young women reporting chronic sleep deprivation had higher mean CESD scores (19.48 [17.59-21.38]), compared to counterparts reporting no history of sleep deprivation (16.59 [15.72-17.45]). No associations were seen in young men. Findings were robust to changes in model re-specification.

Conclusions:

Results indicated that chronic sleep deprivation may be an important determinant of mental health outcomes in adolescents, particularly young women, although there was little support for effects on overall health status. Chronically impaired quality of sleep should be considered in future longitudinal work. Public health efforts to promote mental health for young people may require relevant strategies to support young women in achieving recommended amounts of sleep.

Key messages:

- Chronic sleep deprivation showed no association with adolescents' self-rated health.
- Chronic sleep deprivation was linked to a higher risk of depression in young women only.

Italian adolescents and sexual health: what has changed during the last 20 years?

Carlotta Lorenzini

L Kundisova[1], N Nante[1,2], C Lorenzini[1], V Valeri[3], G Messina[1,2], L Alaimo[3]
[1]Post Graduate School of Public Health, Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
[2]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
[3]Degree Course in Obstetrics, University of Siena, Siena, Italy
Contact: carlotta_lorenzini@hotmail.it

Background:

In the majority of European countries, sex education is mandatory, but Italy is still an exception. Despite sexually transmitted diseases (STD) are believed to be less common today, long-time "forgotten" disease, as syphilis, are returning. The aims of study are i) to examine the knowledge and perceptions of adolescents regarding sex education and STD and ii) to compare our results with Italian national survey.

Methods:

This descriptive cross-sectional study was conducted in 6 middle schools in Siena (Italy) during May-June 2018. Data were anonymous collected using a validate questionnaire previously adopted by the Italian National Institute of Health (NIH). The results were compared with the national survey realized in 1998 by NIH. The analysis was performed using Stata 12.

Results:

From 691 questionnaires, 540 returned fulfilled (78% response rate). The majority (95%) of respondents considered sex education "important" and thought it should be guaranteed by the school; 48% described information received so far as "sufficient", 40% as "adequate". "School" was indicated as the principal source of information (44%), instead of "friends" which resulted in 1998. The respondents were asked to choose from the list the STDs they knew: 96% indicated "AIDS", 62% "syphilis", 38% "HBV" and 36% "gonorrhoea". In comparison to 1998, knowledge of syphilis has decresed (2018:17% vs. 1998:62%) and HBV (2018:38% vs. 1998:58%). Regarding STD, the "mass media" were cited as the principal source of information (56%), followed by "school" (41%) and "General Practitioner" (20%).

Conclusions:

In comparison to 1998 sex education in Italian schools improved, but the knowledge of adolescents regarding the STD worsened. This result can be attributed to the fact that the survey of 1998 was realized during the years when the AIDS awareness was higher. It is necessary to further improve the sex education in Italy in order to prevent STDs.

Key messages:

- The "forgotten" sexually transmitted diseases are becoming common again, the adequate sex education in schools is necessary to prevent them.
- In confrontation to 1998, the sex education in Italian schools improved, but the knowledge of adolescents regarding the STD worsened.

Does adolescents like modern sports experiences? A trivial question for a major public health stake

Maxime Luiggi

M Luiggi[1], M Griffet[1]
[1]University of Aix-Marseille, Institute of Movement Sciences Etienne Jules-Marey, Marseille, France
Contact: maxime.luiggi@univ-amu.fr

Background:

Improving adolescents' levels of sport and physical activity 'PA' is an official public health issue. However, national and European studies showed decline in overall levels of PA of European adolescents. In France, a school-based study showed a decrease in sport participation among adolescents of Marseille and area. Despite of this decline, we do not know whether they have a positive appreciation of modern sports experiences promoted in clubs. In this study, we aimed to measure French adolescents' athletes retrospective reports of pleasure in these experiences.

Methods:

A previous data collection among a representative sample of adolescents' students was used (n = 1132). Adolescents were separated into 4 subgroups based on sex (Boys/Girls) and socioeconomic status 'SES' (Low/High). The Sport Experiences Questionnaire was used to measure retrospective reports of pleasure in competition, progress and risk-taking experiences. Multivariate linear regressions were performed to show differences between sex, SES and setting of participation (competition/no-competition). Densities diagrams were also presented.

Results:

Among girls and boys, the setting of participation was significantly positively linked to reported pleasure. This effect was greater for competition experiences, respectively 1.45-fold and 1.53-fold increase for competition than no-competition players, for boys and girls. Among girls, high-SES girls presented a lower appreciation of competition experiences than their counterparts with low-SES. This relationship was observed in non-competitive (B = -0.62, p-value = 0.016) and competitive (B = -0.70, p-value = 0.025) settings. Finally, progress experiences were appreciated by all.

Conclusions:

These results may help to step back traditional instituted sports offer. They would help to develop sports initiatives adapted to adolescents' tastes. Finally, progress experiences may be gold experiences in sport and should be promoted in all context of participation.

Key messages:

- Modern sport experiences are not appreciated by all subgroups of adolescents. Endeavors to improve sport participation of adolescents should adapt contents to adolescents' tastes.
- Pleasure in competition and risk-taking are linked to setting of participation and adolescents' SES. The progress experiences may be the gold standard of sports experiences.

Adolescents with intellectual disability (ID) and their perceptions of activity and sports

Elisabeth Hansen

E Hansen[1,2], H Nordén[1], M Ohlsson[1]
[1]Swedish Winter Sports Research Centre, Department of Health Sciences, Mid Sweden University, Östersund, Sweden
[2]Faculty of Education and Arts, Nord University, Bodø, Norway
Contact: elisabeth.hansen@miun.se

Background:

Individuals with intellectual disability (ID) are less physically active than individuals without ID, and they rarely or never reach the recommended daily level of physical activity. It is understood that both social interaction and ability in performing work tasks affect participation in daily activity services among people with ID. Individuals with ID generally have a higher risk of hypertension and obesity-related cardiovascular disease than individuals without ID. Professional service providers and parents are often those being asked, it is more seldom that the knowledge comes from the target group (ID) themselves.

Aim:

To identify experiences and feelings among adolescents with ID regarding activity and sports participation, and to identify how they express and perceive the opportunities they have for being active in the community and surroundings where they live, including body and health awareness.

Methods:

12 adolescents with ID, boys and girls, from Mid-Sweden participated in the study. The participants took part in a semi-structured interview that focused on experiences and aspects regarding activity and sports in their surroundings. Interviews identified three aspects: Activity, Surroundings, and Body- and health awareness. Adolescents with ID seems motivated to participate in activities and sports. The role of significant others, family and friends, support and the feeling of joy all seem crucial when reporting being outdoors, participating in ball games and in music activities. They are aware of limitations, sometimes feel bullied and are afraid of being excluded. Participation in activities and sports may be positively associated with health, but limitations such as awareness and support from society challenge the perception of 'fitting in' experienced by adolescents with ID. There is a need for deeper understanding to implement and follow up on the UN convention on rights for individuals with ID, as well as the 2030 sustainable development goals.

Key messages:

- The project aims to identify how individuals with ID can increase their participation in societal activities and hence feel more active and included as citizens.
- Special attention is given to include stakeholders in order to promote implementation and long-term success.

Psychosocial difficulties, obesity and disadvantage in a cohort of Irish children

Mckenzie Dow

M Dow[1,2], A Brinkley[2], G O'Malley[2,3], C Murrin[1]
[1]School of Public Health, Physiotherapy and Sports Science, University College Dublin, Dublin, Ireland
[2]W82GO Programme, Temple Street Children's University Hospital, Dublin, Ireland
[3]School of Physiotherapy, Royal College of Surgeons in Ireland, Dublin, Ireland
Contact: mckenzie.dow@ucdconnect.ie

Background:

Childhood obesity is stabilising in Ireland, but less so in children from disadvantaged backgrounds. There is also evidence for a relationship between psychosocial difficulties and obesity in youth, but findings are often mixed. This study aimed to describe the relationships between psychosocial difficulties, obesity, and disadvantage in a national cohort of children in Ireland.

Methods:

Participants (n = 7275) were surveyed and measured at age nine and thirteen as part of the Growing Up in Ireland study (GUI). Psychosocial difficulties were measured using the Strengths and Difficulties Questionnaire (SDQ). Disadvantage was represented by the education status of the primary caregiver. BMI was calculated using measured height and weight. Weight status categories were created using the UK 1990 Growth Data. Correlation analyses were used to examine the relationship between child BMI and SDQ scores. Associations between weight categories, psychosocial difficulties and education status were examined using Chi-square analysis.

Results:

In children whose parents had secondary education, the obesity rate was 27.9%, compared to 24.7% in those with a college degree ($p < 0.01$). This relationship was also significant at age thirteen (<0.01). Furthermore, BMI was positively correlated with SDQ total score, ($r = .107$, $p = 0.01$) at age nine and at age thirteen ($r = .089$, $p = 0.01$). A significant association was also found between weight status categories and psychosocial difficulties at ages nine ($p < 0.1$), and thirteen ($p < 0.1$). Further findings will be reported following a preliminary longitudinal analysis.

Conclusions:

Obesity is associated with psychosocial difficulties, as well as the education status of the primary caregiver, in a large sample of Irish children. These findings are important for understanding the relationship between childhood obesity and psychological health and have implications for the treatment of obesity in young people.

Key messages:

- There are higher rates of obesity in children whose parents do not have a college degree.
- Childhood obesity remains a serious public health issue, and is associated with psychosocial difficulties in an Irish cohort of children.

1.G. The burden of multiple chronic conditions

Prospective study on chronic diseases and healthcare costs for the south of France region, 2016-2028

Berengere Davin

B Davin[1], S Cortaredona[2,3], V Guagliardo[1], S Nauleau[4], B Ventelou[5], P Verger[1,2,3]
[1]ORS PACA, Southeastern Health Regional Observatory, Marseille, France
[2]Aix Marseille Univ, IRD, AP-HM, SSA, VITROME, Marseille, France
[3]IHU-Méditerranée Infection, Marseille, France
[4]ARS PACA, Southeastern Health Regional Agency, Marseille, France
[5]Aix-Marseille Univ, CNRS, EHESS, Centrale Marseille, Aix-Marseille School of Economics, Marseille, France
Contact: berengere.davin@inserm.fr

Background:

In France, Health Regional Agencies (HRA) have to elaborate a Public Health Plan for the 5 coming years. For estimating future population health needs and associated costs to adapt the health services on the regional territory, the HRA in southeastern France requested a prospective analysis, based on demographic and epidemiologic scenarios about major chronic diseases, to evaluate future trends.

Methods:

Six chronic diseases were selected: diabetes (1 or 2), cardiovascular diseases, respiratory diseases, cancers, neurological diseases and dementia. We used medico-administrative data from the National health insurance fund, and adapted algorithms to identify people with these diseases. We calculated prevalence rates according to gender and age and used two alternative scenarios (a constant one, and a trend-based one) to estimate the number of people with chronic diseases in 2023 and 2028, starting in 2016. We also estimated future healthcare costs according a constant and a trend-based scenario.

Results:

The algorithms detect reasonable rates of disease compared to official rates available for 2016. Due to demographic (ageing) and/or epidemiologic trends, the number of people with chronic diseases will highly increase during the next ten years in the South of France region. For instance, between 2016 and 2028, there will be from 15% to 20% more people with diabetes. Associated costs will also be higher (+33% between

2016 and 2028), especially those granted to nursing care (+40%).

Conclusions:

Burden of diseases and health expenditures are going to increase in the future. Projections are needed to help policymakers anticipating the required health services adaptation. Medico-administrative database are an invaluable source of data to do so. The next step of this project will consist in estimating those trends for smaller geographical areas.

Key messages:

- Data of the French Health Insurance fund can be used to predict future prevalence of chronic diseases and healthcare costs.
- South of France will face a main increase of people with chronic diseases.

Patients with more comorbidities have better detection but poorer management of chronic diseases

Grace Sum

G Sum[1], GCH Koh[1], SW Mercer[2], YW Lim[3], A Majeed[4], B Oldenburg[5], JT Lee [6]
[1]Saw Swee Hock School of Public Health, National University of Singapore, Singapore, Singapore
[2]Usher Institute of Population Health Sciences, University of Edinburgh, UK
[3]Yong Loo Lin School of Medicine, National University of Singapore, Singapore, Singapore
[4]Department of Primary Care and Public Health, Imperial College London, UK
[5]Nossal Institute for Global Health, University of Melbourne, Melbourne, Australia
Contact: gracesum@u.nus.edu

Background:

The burden of non-communicable diseases (NCDs) is rising rapidly in middle-income countries (MICs), where NCDs are often undiagnosed, untreated and uncontrolled. How comorbidity impacts diagnosis, treatment, and control of NCDs is an emerging area of research inquiry and have significant clinical implications as highlighted in the recent National Institute for Care Excellence (NICE) guidelines for treating patients suffering from multiple NCDs. This is the first study to examine the association between increasing numbers of comorbidities with being undiagnosed, intreated, and uncontrolled for NCDs, in six large MICs.

Methods:

Cross-sectional analysis of WHO SAGE Wave 1 (2007-10), which consisted of adults aged $\geq$18 years from six populous MICs including, China, Ghana, India, Mexico, Russia and South Africa (overall n = 41, 557).

Results:

Higher number of comorbidities was associated with better detection of hypertension, angina and arthritis, and better odds of having treatment for hypertension and angina. However, increasing comorbidity had the opposite effect on being uncontrolled, and was associated with increased odds of uncontrolled hypertension, angina, arthritis, and asthma. Comorbidity with concordant conditions was associated with improved diagnosis and treatment of hypertension and angina. Comorbidity with concordant conditions was not associated with decreased nor increased odds of being uncontrolled for all NCDs.

Conclusions:

Patients with more comorbidities have better diagnosis of chronic conditions, but this does not translate into better management and control of these conditions. Improving continuity of care and monitoring treatment are priorities for health systems with ageing populations.

Key messages:

- Patients with more comorbidities have better diagnosis of chronic conditions.
- but this does not translate into better management and control of these conditions.

The concurrence of chronic diseases among unemployed and employed persons: a register-based study

Merel Schuring

B Yildiz[1], M Schuring[1], MG Knoef[2], L van Zoonen[3], A Burdorf[1]
[1]Department of Public Health, Erasmus MC, Rotterdam, Netherlands
[2]Department of Economics, Leiden University, Leiden, Netherlands
[3]Erasmus Graduate School of Social Sciences and Humanities, Erasmus University Rotterdam, Rotterdam, Netherlands
Contact: m.schuring@erasmusmc.nl

Background:

The first aim of this study was to describe the prevalence of chronic diseases and multimorbidity among employed and unemployed persons. The second aim was to investigate associations of sociodemographic characteristics with the prevalence of chronic diseases and multimorbidity.

Methods:

Data linkage of large-scale registries on employment status, medication use and sociodemographic characteristics for all Dutch residents in 2016 was applied. In total, 5,074,227 subjects aged 18-65 years were included in the study. The prevalence of six common chronic diseases and multimorbidity was investigated among unemployed and employed persons. Multivariate logistic regression analyses were performed to examine associations of sociodemographic characteristics with the prevalence of chronic diseases and multimorbidity.

Results:

Unemployed persons had a higher prevalence of psychological disorders (18.3% vs 5.4%), cardiovascular disease (20.1% vs 8.9%), inflammatory diseases (24.5% vs 15.8%), and respiratory illness (11.7% vs 6.5%) compared to employed persons. Unemployed persons were more likely to have one (OR 1.30, 95% CI 1.29-1.31), two (OR 1.74, 95% CI 1.73-1.76) and at least three chronic diseases (OR 2.59, 95% CI 2.56-2.61) than employed persons. Older persons, women, lower educated persons and migrants were more likely to have one, two, and at least three chronic diseases. Especially at younger ages, psychological disorders and inflammatory conditions were more prevalent but declined from middle age onwards among unemployed persons, whereas as slight increase from middle age onwards was observed among employed persons.

Conclusions:

Using objective data, this study provided evidence for inequalities in the prevalence of chronic diseases and multimorbidity, indicating employment status to be an important determinant of health. Policy measures and health interventions should target chronic diseases and multimorbidity, especially among unemployed persons.

Key messages:

- Using objective data, this study showed that unemployed persons had a higher prevalence of chronic diseases and multimorbidity compared to employed persons.
- In particular older persons, women, lower educated persons and migrants were more likely to have chronic diseases and multimorbidity.

Depressive symptoms, neuroticism and participation in breast and cervical cancer screening in the UK

Claire Niedzwiedz

CL Niedzwiedz[1], KA Robb[1], SV Katikireddi[2,1], JP Pell[1], DJ Smith[1]
[1]Institute of Health and Wellbeing, University of Glasgow, Glasgow, UK
[2]MRC/CSO Social and Public Health Sciences Unit, University of Glasgow, Glasgow, UK
Contact: claire.niedzwiedz@glasgow.ac.uk

Background:

Globally, more than 2 million women are diagnosed with breast or cervical cancer every year. Depressive symptoms and personality traits have been implicated in cancer-related mortality, but the potential mechanisms through which these associations may operate are not well understood. We aimed to assess how depressive symptoms and neuroticism are associated with participation in breast and cervical cancer screening.

Methods:

273 402 women in the UK Biobank cohort who were eligible for breast cancer screening (aged 50-70 years) and/or cervical cancer screening (<65 years) at baseline recruitment (2006-10) and those with follow-up data (2014-March 19) were identified. Depressive symptoms (4 items from Patient Heath Questionnaire) and neuroticism (12 items from Eysenck Personality Inventory Neuroticism Scale) were self-reported at baseline. The primary outcomes were reporting being up to date with breast and cervical cancer screening. For prospective analyses, patterns of screening participation from baseline to follow-up were derived. Logistic regression was used to analyse associations, adjusted for potential confounders.

Results:

More severe depressive symptoms (range 0-12) were associated with reduced screening for breast (OR = 0.960, 95% CI: 0.950,0.970) and cervical cancer (OR = 0.958, 95% CI: 0.950,0.966). Prospective analyses revealed higher baseline depressive symptoms were related to decreased cervical cancer screening at follow-up (OR = 0.955, 95% CI: 0.913,0.999; equivalent to a difference of 4.08% between the highest and lowest depressive symptom score), but not with breast cancer screening. Results for overall neuroticism were inconclusive, but individual neuroticism items including anxiety and nervousness were related to increased screening participation.

Conclusions:

More severe depressive symptoms may act as a barrier for cancer screening participation and could be an indication for more proactive strategies to improve uptake.

Key messages:

- Women with more severe depressive symptoms are less likely to be up to date with their breast and cervical cancer screening, which may exacerbate existing health inequalities.
- Interventions to increase screening participation among women with poor mental health may be merited.

Socioeconomic trajectories and risk of hospitalization in the Moli-sani Study cohort

Licia Iacoviello

M Bonaccio[1], *A Di Castelnuovo*[2], *S Costanzo*[1], *M Persichillo*[1], *A De Curtis*[1], *C Cerletti*[1], *MB Donati*[1], *G de Gaetano*[1], *L Iacoviello*[1,3]
[1]Epidemiology and Prevention, IRCCS NEUROMED, Pozzilli, Italy
[2]Mediterranea, Cardiocentro, Naples, Italy
[3]Medicine and Surgery, University of Insubria, Varese, Italy
Contact: licia.iacoviello@moli-sani.org

Background:

A life course approach was used to explore the impact of socioeconomic status (SES) on risk of hospitalizations for all-cause and for cardiovascular disease (CVD).

Methods:

Longitudinal analyses on 19,999 subjects apparently free from CVD and cancer, recruited in the Moli-sani Study, Italy (2005-2010). Low and high SES in childhood, educational attainment (low/high) and SES during adulthood (measured by a score including material resources and dichotomized as low/high) defined the trajectories over life course. First hospital admissions were recorded by direct linkage with hospital discharge form registry. Hazard ratios (HR) with 95% confidence interval (95%CI) were calculated by multivariable Cox-regression.

Results:

Over a median follow up of 7.3 y, we ascertained a total of 7,594 all-cause and 2,539 CVD hospitalizations. Poor childhood SES was associated with 11% and 17% increased risk of all-cause and CVD hospitalizations, respectively. Among subjects with poor childhood SES, an upward trajectory in education was associated with lower risk of hospital admission for all-cause (HR = 0.85; 95%CI 0.76-0.94) and CVD (HR = 0.78; 0.64-0.95), as opposed to subjects remained stably low (low education and adulthood SES). Individuals with high childhood SES, but not educational achievement, were at 26% increased risk of hospitalization for any cause, as compared to the stably high SES group, while failure to achieve both educational and material advancements was associated with 37% higher risk of CVD hospitalization.

Conclusions:

In a large sample of healthy adults, social mobility (educational and/or material upward trajectories) was associated with lower incidence of hospital admissions for all-cause and CVD.

Key messages:

- Social mobility may counterbalance the negative health burden associated with low early-life SES.
- High SES in childhood poorly affects hospitalization risk if no additional achievements across life course occur.

1.H. Prediction and control of health care costs

No UHC without medicines: out-of-pocket payments for non-communicable diseases in 18 countries

Adrianna Murphy

A Murphy[1], *B Palafox*[1], *S Rangarajan*[2], *S Yusuf*[2], *M McKee*[1]
[1]Centre for Global Chronic Conditions, LSHTM, London, UK
[2]Population Health Research Institute, McMaster University, Hamilton, Canada
Contact: adrianna.murphy@lshtm.ac.uk

Background:

In 2014 the United Nations agreed on a goal to reduce premature mortality from NCDs by improving financial risk protection. We are far from achieving this: households with NCDs are at an increased risk of catastrophic health spending and impoverishment, particularly in lower middle- and low-income countries. There is a need to better understand the drivers of health spending among households with NCDs, to inform interventions aimed at achieving universal health coverage.

Methods:

Using data from the Prospective Urban and Rural Epidemiology Study, we analyse out-of-pocket expenditure (OOP) among households with NCDs (cancer, cardiovascular disease, hypertension, diabetes, respiratory disease or kidney disease) in 18 countries: Canada, Sweden, Brazil, Chile, Malaysia, Poland, South Africa, Turkey, China, the Philippines, Colombia, Iran, the Occupied Palestinian Territory (OPT), Bangladesh, India, Pakistan, Zimbabwe and Tanzania.

Results:

The leading driver of OOP on health care in almost all countries included is medicine. For example, the monthly OOP on medicines among NCD households in Iran, where roughly 18% of NCD households experience catastrophic spending, is USD 13.50, representing 36% of OOP on health. In Brazil this figure is USD 25.85, representing 46% of OOP on health. A large proportion of OOP is also made up by consultation fees, particularly in Sub-Saharan African countries. In Poland, 63% of OOP on health is spent on alternative medicine consultation fees.

Conclusions:

Our findings echo the message shared by the Director General of the World Health Organization in 2018, that there is ‘‘no Universal Health Coverage without access to quality medicines’’. Medicine costs impose a significant economic burden on NCD households in countries at all levels of development, highlighting the need to include essential medicines for NCDs in universal health coverage benefit packages.

Key messages:

- To achieve the goal of improved financial risk protection for NCDs we need to understand drivers of out-of-pocket spending among households with NCDs.
- Medicines are by far the largest driver of OOP in countries at all levels of development and require urgent attention to ensure universal health coverage.

Economic evaluation of the Austrian telephone-based triage system

Herwig Ostermann

H Ostermann[1,2], F Bachner[1], M Zuba[1], L Rainer[1], M Halla[3,1]
[1]Department of Health Economics and Systems Analysis, Austrian Public Health Institute/Gesundheit Österreich GmbH, Vienna, Austria
[2]Department of Public Health, Health Service Research and HTA, University for Health Sciences, Medical Informatics and Technology, Hall/Tyrol, Austria
[3]Institute of Economic Policy, Johannes Kepler University Linz, Linz, Austria
Contact: herwig.ostermann@goeg.at

Background:

In order to reduce avoidable consultations but also avoidable self-referrals to hospital outpatient departments, the Austrian authorities agreed to establish a voluntary telephone-based triage system in the course of the health reform 2013. Three regions piloted the system in early 2017.

Methods:

An economic evaluation aimed to assess the impact on health service demand after having consulted the telephone-based system. For analysing the impact, we used the conceptual model of ''shift cases'' from one particular service setting such as outpatient clinic to another (e.g. GP office) and calculated savings realised through patient shifts. Based on potential savings in private and public costs and running costs of the service, we identified threshold values for cost-effective operation.

Results:

In total, approximately 45,000 completed telephone consultations were registered in the pilot phase. 2,500 persons were advised to conduct self-care whereas more than 40,000 were recommended to contact a health service provider with differing levels of priority. Adherence to the initial recommendation of the provider setting was 70%, the level of priority was met in 90%. With regard to the economic impact, public savings of shift cases range from €31 (self-care instead of GP consultation) to €198 (GP/specialist instead of hospital outpatient clinic). Public costs ranged between €10 and €50 depending on the degree of capacity utilisation, contingency costs and duration of calls. Therefore, economic net gains can be realized if approximately 15% to 25% of callers choose a lower care setting due to the consultation service.

Conclusions:

The tele-triage service has shown to be a potentially cost effective tool but largely depends on user uptake, patient adherence and local maintaining costs. In order to exploit the full potential of the system, policy makers are advised to promote the use of the system in general and to evaluate the used algorithm.

Key messages:

- Telephone-based triage systems are a potentially cost-effective strategy in order to reduce avoidable encounters both on a primary care level but also at hospital outpatient clinics.
- The public savings of a shift in the provider setting vary substantially depending on the level of service delivery with diminishing savings for shifts in lower levels.

Activity-based hospital payments: a qualitative evaluation by Israeli managers and physicians

Ruth Waitzberg

R Waitzberg[1,2,3], W Quentin[3,4], R Busse[3,4], D Greenberg[2]
[1]Health Policy Research, Myers-JDC-Brookdale Institute, Jerusalem, Israel
[2]School of Public Health, Ben-Gurion University of the Negev, Beer Sheva, Israel
[3]Department of Health Care Management, Technical University Berlin, Berlin, Germany
[4]European Observatory on Health Systems and Policies, WHO, Brussels, Belgium
Contact: ruthw@jdc.org

Background:

Israel has expanded procedure-related group (PRG) payments instead of per-diem payments for hospitals. There is scarce literature that documents the process of adoption of DRGs and its entailed economic incentives according to hospital workers' perspectives. Important issues remain underexplored such as how managers transmit the incentives and considerations to caregivers, how physicians embrace (or not) these new rules of the game.

Methods:

We used qualitative, grounded-theory analysis based on 35 semi-structured in-depth interviews with managers, financial directors, surgical ward heads and physicians in 5 hospitals, sampled by maximum variation according to hospital characteristics.

Results:

We found two main themes: incentives for change and barriers to change. The most significant change was the creation of a common professional language, which facilitates measurement and supervision of activities, outcomes, and profitability. Measurement enhances transparency and is essential for resource management. Respondents also reported barriers inhibiting their responsiveness to the economic incentives of PRGs: a complicated coding system; inappropriate pricing; dependency on numerous production factors; lack of transparency; lack of coordinated goals among players; and other medical or moral considerations that outweigh or co-exist with financial considerations.

Conclusions:

The adoption of PRGs led to changes in managers' and physicians' actions and considerations, particularly in situations where it was possible to reprioritize elective procedures without harming patient health or quality of care. However, on a broader level, the impact was modest, leading mainly to a fairer redistribution of resources and the rearrangement of work, such as shifting patients to after-hours. It would be appropriate to allow hospitals and physicians to operate in a less restricted market where regulation allows suppliers some degree of discretion so they can react to the PRG reform.

Key messages:

- Provider payment reforms change economic incentives, behavior and decision-making.
- However, structural barriers and other non-economic considerations may lead to unintended consequences of such reforms.

Expansion of activity-based hospital payment in Israel: evaluation of effects on inpatient activity

Ruth Waitzberg

R Waitzberg[1,2,3], W Quentin[3,4], R Maoz-Breuer[1], R Busse[3,4], D Greenberg[2]
[1]The Smokler Center for Health Policy Research, Myers-JDC-Brookdale Institute, Jerusalem, Israel
[2]School of Public Health, Ben-Gurion University of the Negev, Beer Sheva, Israel
[3]Department of Health Care Management, echnical University Berlin, Berlin, Germany
[4]European Observatory on Health Systems and Policies, WHO, Brussels, Belgium
Contact: ruthw@jdc.org

Background:

In 2013-14, Israel stepped up the replacement of per-diem payments by Procedure-Related Group (PRG) based hospital payments, a local version of Diagnosis-Related groups (DRGs). PRGs were created for selected procedures in urology, general surgery, gynecology and ophthalmology. We analyzed how did this change affect inpatient activities, measured by the number of discharges, average length of stay (ALoS), and the case-severity Charlson Comorbidity Index (CCI).

Methods:

We investigated the impacts of the PRG-payment reform on 15 procedures. Observations covered groups of inpatients, by age and gender, who underwent these procedures in 2005-2016 at all non-profit hospitals. We examined the effect of the payment change on the number of discharges, ALoS and CCI using a multivariable analysis of Ordinary Least Squares controlling for patients, hospital characteristics, and year fixed-effects.

Results:

Data on 89,533 patients were examined. During the study period, the ALoS decreased except for one procedure, the number of inpatients increased for most procedures, and case severity remained stable. The multivariable analysis suggests that the transition to PRG-payments contributed to changes in ALoS or case severity for only 3 out of 15 procedures examined. The PRG-reform contributed to changes of 10%-45% in the number of patients, but there was no clear trend: it increased in 9, and decreased in 5. The changes did not follow a clear pattern according to procedures' price changes after the reform.

Conclusions:

Factors that may have hampered the effects of the PRG-reform are conflicting incentives created by other co-existing hospital-payment components, such as revenue caps and retrospective subsidies, and the lack of resources to increase productivity.

Key messages:

- Provider payment reforms should carefully coordinate the entire payment system, otherwise the incentives may be blurred.
- Uncoordinated reforms may miss their goals.

Impact of mental illness on in-patient hospital costs for somatic disorders and associated factors

Morgane Michel

M Michel[1,2,3], AJ Hammami[1,3], K Chevreul[1,2,3]
[1]URC Eco, Assistance Publique-Hôpitaux de Paris, Paris, France
[2]Unité d'Epidémiologie Clinique, Assistance Publique-Hôpitaux de Paris, Paris, France
[3]UMR 1123, INSERM, Université de Paris, Paris, France
Contact: morgane.michel@urc-eco.fr

Background:

People suffering from mental disorders are in poorer somatic health that the general population. This is due in part to poor quality of care in primary care settings, which can in turn have a major impact on hospitals and healthcare systems, in particular in terms of costs. Our objective was to assess the economic burden of acute care admissions for somatic diseases in patients with a mental illness compared to other patients and analyse the factors associated with it.

Methods:

An exhaustive study using French hospital discharge databases was carried out between 2009 and 2013. Total acute hospital costs were calculated from the all payer perspective (statutory health insurance, private health insurances and patient out-of pocket payments). A multivariate regression modelled the association between mental illness and hospital costs while adjusting for other explanatory variables, with and without interaction terms.

Results:

37,458,810 admissions were included in the analysis. 1,163,972 patients (6.54%) were identified as being mentally ill. Mean total hospital costs at five years per patient were €8,114. Costs per mentally ill patient were on average 34% higher than for a non-mentally patient (€10,637 vs. €7,949). A longitudinal analysis of costs showed a widening of the gap between the two groups as time went by, from 1.60% in 2009 to 10.51% in 2013. In the multivariate model, mental disorders were significantly associated with increased costs, and interaction terms found an increased impact of mental illness on costs in deprived patients.

Conclusions:

Improving quality of primary care and health promotion in people with a mental illness both for their own sake and to decrease the economic burden on the healthcare system, is of vital importance.

Key messages:

- There is a significant increase in hospital costs for somatic care in patients with a mental illness compared to other patients, in particular in patients who are also deprived.
- It is necessary to improve primary care and health promotion in mentally ill patients, for their sake and for the sake of healthcare systems.

Outsourced management service to guarantee safety and cost-effectiveness in pediatric cardiac surgery

Jacopo Ceradini

J Ceradini[1], T Corsetti[1], C Brusco[1], A Mazzaccara[2], M Raponi[1]
[1]IRCCS Ospedale Pediatrico Bambino Gesù, Rome, Italy
[2]ISS, Rome, Italy
Contact: jacopo.ceradini@opbg.net

Background:

Children's hospitals deal with young patients, who have greater variability than adults, therefore size of the medical devices ranges from the newborn to the adult-like patient. This complexity is associated with higher costs to ensure safety and logistics. In June 2014 Bambino Gesù Children's Hospital (OPBG) adopted an outsourced service for medical device acquisition and stock records for the execution of cath-lab and heart surgery interventions.

Goal:

To evaluate the services effectiveness multi-dimensionally in terms of cost saving, safety, outcomes and operator satisfaction. We measured costs and indicators in pre and post intervention. Materials and methods. We compared the years from 2013 to 2017 in terms of cost-related device and prosthesis consumption, including mean costs per intervention using ANOVA with Tukey's Post-hoc test. To evaluate the clinical proxy outcome we calculated the pediatric index of mortality for each year.

Results:

In 2013-2017 we performed a mean of 1985 (ds 140) procedures per year with devices, the sample is homogeneous in size and clinical complexity. The trend shows a solid decrease of expenses after the service introduction: we observed a reduction of 20% of the mean consumption per intervention between year 2013 and year 2017 (1707€ vs 1391€) $P < 0.001$. For what concerns outcomes we noticed a reduction of Standardized Mortality Ratio index from 0.51 to 0.27 (CI 0.18-0.42) in 2014-2017.

Discussion:

Outcome indicators excludes any increase of risk following the adoption of the service. The hospital pharmacy did not receive any reports regarding incidents attributable to the service. The nurses evaluated the service positively regarding the availability, traceability of the devices and decrease of the warehouse work.

Conclusions:

Outsourced service has been cost saving, safe and well accepted by operators and in our opinion is replicable also in other highly complex pediatric hospital settings.

Key messages:

- Children hospitals are associated with higher costs to ensure safety and logistics in surgery and cath-lab with medical devices.
- Outsourced management service can promote cost saving and safety.

Diagnosis and Treatment of Malignant Pleural Mesothelioma (MPM) Care Pathway and its cost analysis

Martina Giusti

M Giusti[1], F Battisti[2], L Kundisova[3], N Persiani[1], E Chellini[2]
[1]Department of Experimental and Clinical Medicine, University of Florence, Florence, Italy
[2]Occupational & Environmental Epidemiology Unit, Cancer Network, Prevention and Research Institute (ISPRO), Florence, Italy
[3]Post Graduate School of Public Health, University of Siena, Siena, Italy
Contact: martina.giusti@unifi.it

MPM is one of the most serious professional cancer with a high frequency in subjects previously exposed to asbestos. Several trials have been made or are ongoing to define an effective therapy to allow a longer survival and to reduce its burdensome management by the health systems. The few MPM Care Pathways (CP), which have been suggested by groups of experts of scientific community, are only a list of practicable interventions without the structure of a pathway so the aims of this paper are the declination of possible cases of a MPM CP and the quantification of the costs using a regional consensus CP, verifying its application.

The diagnostic and therapeutic procedures of the regional CP were defined starting to a sample of 34 patients treated in public regional hospitals for MPM, diagnosed in 2015, and having.at least a one year follow up. The costs were attributed using the regional price list for outpatient health activities and the DRG for hospitalized activities. The formed cost accounting model was applied in order to calculate the cost for the public regional administration. Last, the obtained results were discussed with surgical thoracic surgeons of the three regional university hospitals.

The developed cost accounting model has identified three cases of a MPM CP. They present a common diagnostic phase (7.246,90€) following by three possible treatments, differently combinable between them: surgery (10.808,00€), chemotherapy (164,00€ + drug cost for access) and observation (41,00€). The cost will be due to the specific combination of the three treatments plus the diagnostic phase, predictable according to patient's age and staging, which can afford each patient affected by MPM.

The contribution of the cost accounting model applied to the consensus regional CP for MPM allows to assess the care's appropriateness of the cases actually treated. It could be used also for CPs of other diseases and as a method for institutional financing of the route.

Key messages:

- Relevance of a shared Care Pathway realisation for a rare, highly letal and complex professional disease.
- An accurate and scientific costs analysis model to a C is an innovation.

1.I. Surveillance and control of infectious diseases

Area deprivation and notifiable infectious diseases in Germany: A longitudinal small-area analysis

Sven Rohleder

S Rohleder[1], C Stock[2], W Maier[3], K Bozorgmehr[1,4]
[1]Department of General Practice and Health Services Research, University Hospital Heidelberg, Heidelberg, Germany
[2]Institute of Medical Biometry and Informatics, University of Heidelberg, Heidelberg, Germany
[3]Institute of Health Economics and Health Care Management, Helmholtz Zentrum München, Neuherberg, Germany
[4]Department of Population Medicine and Health Research, Bielefeld University, Bielefeld, Germany
Contact: sven.rohleder@med.uni-heidelberg.de

Background:

Socioeconomic inequalities may affect the infectious disease incidence. We studied the association between area deprivation and incidence of notifiable infectious diseases in Germany to understand spatio-temporal patterns and the effects of societal factors on disease epidemiology.

Methods:

Using national surveillance data of 401 districts from 2001 to 2017, we examined the incidence of infectious diseases using spatiotemporal Bayesian regression models. We analyzed eight disease classes: blood-borne viral hepatitis, gastrointestinal, vaccine preventable, vector-borne, zoonotic, other bacterial, other infectious, and overall burden of infectious diseases. As explanatory factors we considered area deprivation (measured by the German Index of Multiple Deprivation), fraction of non-nationals, sex, age, and spatiotemporal effects.

Results:

A risk gradient across deprivation quintiles was observed for the overall burden of infectious diseases. The relative risk (RR) for gastrointestinal diseases in areas with medium and high deprivation relative to low deprivation was 1.65 (95%-credible interval [CrI] 1.01-2.54) and 2.64 (1.22-4.98), respectively. The RR for vector-borne diseases was 1.89 (1.27-2.73) in districts with high deprivation compared to areas with low deprivation. Lower risks in highly deprived areas relative to low deprived areas were identified in vaccine-preventable diseases (RR = 0.39; 0.14-0.88) and zoonoses (RR = 0.69; 0.48-0.96). For blood-borne viral hepatitis, other bacterial, and other infectious diseases no association with area deprivation was observed. Spatial risks of infections were predominantly concentrated in eastern parts of Germany and changed marginally over time.

Conclusions:

The risks of infections tend to be higher in more deprived areas and in eastern parts of Germany, but they varied by class of disease. Our results can guide measures of infectious disease control and prevention by considering spatial risks and deprivation.

Key messages:

- Area deprivation has both positive and inverse associations with the incidences of infectious diseases in Germany. Regions with increased risks may benefit from targeted public health measures.
- Spatial risks of infections tended to be higher in eastern regions of Germany. Disparities in the incidence of infectious diseases may be still present between western and eastern Germany.

Sustainable Development Goals and the challenge of Human resources for health in Congo

Gilbert Ndziessi

G Ndziessi[1], R Bileckot[2]
[1]Department of Public Health, Faculty of Health Sciences, Marien Ngouabi University, Brazzaville, Congo
[2]Department of General Inspectorate, Ministry of Health and Population, Brazzaville, Congo
Contact: ndziessi@yahoo.fr

Background:

In order to achieve the Sustainable Development Goals (SDGs), equitable access to skilled and motivated health workers within a performing health system is need to be ensured. The health system in Congo is characterized by low quantity and quality of Human resources for health (HRH), which constitutes an important barrier to achieving to expanding coverage and integrated primary health care.

Objectives:

To estimate needs of HRH in Congo from 2019 to 2030 and analysed the capacity of the country to address the estimated needs.

Methods:

Cross-sectional study was conducted in Ministry of Health from June to November 2018. Data from 2011 national HRH Census was used as the baseline for projections. We performed annual projections based on current numbers of midwives, nurses and physicians. Health workforce-population ratios by year in national and department level were provided. Population estimations were computed using Spectrum software assuming a 3% growth rate. Mapping for distribution by department was performed used QSGI software.

Results:

In 2019, Congo has 4849 midwives, nurses and physicians, including 465 doctors, 912 midwives and 3469 nurses. All of Congo departments have not surpassed the availability threshold of 4, 5 midwives, nurses and physicians per 1000 inhabitants in 2019. In overall, this ratio will rise from 0.9 per 1000 inhabitants in 2019 to 0.42 per 1000 inhabitants in 2030 due to the retirement. Needs for additional workforce were estimated at 29416 midwives, nurses and physicians by 2030, average of 2451 per year. However, current national production capacity of human resources for health is very low and will not cover the estimated needs as scheduled.

Conclusions:

There is a crisis in the health workforce in Congo, expressed in acute shortage. Results highlight needs of building adequate policies to address production and management of the health workforce, to come close to reaching the MDGs for health.

Key messages:

- At current production capacity, Congo has not the number of physicians, nurses, and midwives it needs to address HRH shortages in the national Health system by 2030.
- The health human resources crisis in sub-Saharan Africa countries will be a major obstacle to achieving the Millennium Development Goals.

Untreated alcohol use disorder in people who inject drugs: a major barrier to HCV treatment uptake

Tangui Barré

T Barré[1,2], F Marcellin[1,2], V Di Beo[1,2], J Delorme[3], P Mathurin[4], C Protopopescu[1,2], M Coste[1,2], N Authier[3], P Carrieri[1,2], B Rolland[5]
[1]SESSTIM, AMU/INSERM/IRD, Marseille, France
[2]ORS PACA, Marseille, France
[3]Neuro-Dol, University Clermont Auvergne, CHU Clermont-Ferrand, INSERM, Clermont-Ferrand, France
[4]Service des Maladies de l'Appareil Digestif, Univ Lille, CHU Lille, INSERM, Lille, France
[5]Service Universitaire d'Addictologie de Lyon, CH Le Vinatier, University Lyon, UCBL, CNRS, INSERM, CRNL, Lyon, France
Contact: tanguibarre@hotmail.fr

Aims:

Although people who inject drugs (PWID) are the core at-risk population in the hepatitis C (HCV) epidemic in industrialized countries, few initiate treatment. Alcohol use disorder (AUD), common within this population, has been identified as a barrier to HCV treatment uptake in the general population. We investigated whether the arrival of new and well-tolerated HCV treatments (direct-acting antivirals: DAA) has improved HCV treatment uptake in French PWID compared with former treatments (pegylated interferon-based treatments: Peg-IFN).

Methods:

Analyses were based on exhaustive care delivery data collected between 2012 and 2016 (study period) in the French national healthcare reimbursement database. Chronic HCV-infected individuals who received opioid agonist therapy (OAT) at least once during the study period were included. Separate analyses were performed for 2012-2013 (Peg-IFN era, 19,700 patients) and 2014-2016 (DAA era, 22,545 patients). Using discrete-time Cox proportional hazards models, we tested for associations between AUD (i.e. AUD-related long-term illness status, diagnosis coding during hospitalization or AUD pharmacological treatment) and first HCV treatment delivery, after adjusting for gender, age, complementary universal health cover, liver disease severity and type of OAT received.

Results:

Incidence rate of HCV treatment uptake per 100 person-years [95% confidence interval] was 6.56 [6.30-6.84] and 5.70 [5.51-5.89], for Peg-IFN-based treatment (2012-2013) and DAA (2014-2016), respectively. After multiple adjustment, people with AUD not receiving related medication had 30% and 14% lower Peg-IFN-based treatment and DAA uptake, respectively, than those without AUD (hazard ratio [95%CI]: 0.70 [0.62-0.80] and 0.86 [0.78-0.94]). No difference was observed between those treated for AUD and those without AUD.

Conclusions:

Despite the benefits of DAA, untreated AUD is still a major barrier to HCV treatment access for PWID in France.

Key messages:

- AUD is still a barrier to HCV treatment for French PWID.
- DAA availability improved HCV treatment uptake for PWID with AUD.

Discrimination of people living with hiv/aids: a survey with dentists in Abidjan, Côte d'Ivoire

Background:

Despite several decades of fighting HIV infection, discrimination against people living with this infection persists, even among health professionals. Understanding the determinants of discriminatory attitudes of dentists is a first step towards access to oral health care and improved care for people living with HIV (PLHIV). Objectives: To analyse the determinants of discriminatory attitudes towards people living with HIV among dentists in Côte d'Ivoire.

Methods:

A cross-sectional survey was conducted among dentists in Abidjan in 2016. In addition to socio-professional characteristics, a questionnaire collected information on their knowledge about HIV (transmission, hiv-related oral diseases) and their individual perception (fear of being contaminated, cross-contamination...). The chi^2 test for independent sampling was used to identify factors associated with discriminatory attitudes (threshold $\alpha = 5\%$).

Results:

A total of 120 dentists were interviewed: 61.3% from the public sector; 56.7% men; 54.2% in couple; 53.3% had participated in continuing education on HIV; 29.2% did not know HIV-related diseases and transmission modes and 69.2% reported fear of being infected during care; 44.2% reported informing staff of the patient's HIV status. The proportion of dentists with discriminatory attitudes was estimated at 69.2%. The main associated factors were: female gender ($p = 0.001$), living in couple ($p = 0.000$), lack of knowledge of the risk of HIV transmission after a blood exposure accident ($p = 0.000$), the law protecting people living with HIV in Côte d'Ivoire ($p = 0.009$) and fear of being infected ($p = 0.000$).

Conclusions:

The results of this study show that the determinants of discriminatory attitudes among dentists result from their lack of knowledge of the disease, justifying the need to strengthen their continuing education on HIV/AIDS infection.

Key messages:

- Dentists discrimination towards people living with HIV infection result from their lack of knowledge about the infection.
- It's essential to strengthen their knowledge about HIV in order to improve access to care for people living with HIV.

//blrnas3/cenpro/ApplicationFiles/Journals/OUP/EURP/Vol00000/190193/Comp/APPFile/OP-EURP190193.3d [25.10.2019–6:48pm] [6–298] Paper: OP-EURP190193

Predictors of overall mortality among people living with HIV/AIDS in Brazil, 2007-2015

Melina Erica Santos

ME Santos[1,2,4], RA Ribeiro[3], C Protopopescu[1,4], M Nishimwe[1,4], I Yaya[5], MP Carrieri[1,4], WN Araujo[6]

[4]ORS, PACA, Marseille, France
[5]INSERM, IRD, University of Montpellier, Montpellier, France
[6]Faculty of Ceilandia, University of Brasilia, Brasilia, Brazil
Contact: melinabtu@gmail.com

Background:

In Brazil there are 926,742 people living with HIV/AIDS (PLWHA). Despite the introduction of antiretroviral therapy (ART) in 1996 and treatment for all in 2014, mortality has increased in some regions. This study aimed to estimate the factors associated with overall mortality in PLWHA to recommend public health actions.

Methods:

We studied PLWHA aged $\geq$18 years old, followed-up from 2007 to 2015 in the universal health system in Brazil. We used a national database (disease reporting, laboratory tests, ART and death notifications). Kaplan-Meier method and Cox model were used in survival analysis. The outcome was all-cause deaths. The explanatory variables measured at baseline were sociodemographic characteristics, HIV transmission mode and coinfections by hepatitis B (HBV) and C (HCV). The time-varying variables were CD4 cell count, viral load (VL) and ART status.

Results:

Study population (n = 411,281) was mainly male (61%), under 40 years old (61%), Caucasian (37%), with basic education (43%), heterosexual HIV-infection mode (41%), resident in Southeast region (48%). The co-infection rate was 2.5% for HCV, and 1.4% for HBV. Median time to ART initiation was 83 days. During the follow-up period (median: 4 years), 61,757 deaths occurred (6% HCV-coinfected and 2% HBV-coinfected). The global mortality rate was 3.44 [95% confidence interval: 3.42-3.47] per 100 person-years (PY) during 1,793,417 PY. The factors associated with increased mortality in multivariable analyses were male gender, age over 40, non-Caucasian race, HIV infection by drug use, resident in North, Northeast and South regions, HCV and HBV coinfection, VL $\geq$ 200 copies/mL and starting ART with CD4<200 cells/mm3.

Conclusions:

Although PLWHA start ART in less than 3 months after the beginning of follow-up, there is still late treatment (at CD4<200 cells/mm3). Screening should target all populations regardless of risk group. Coinfected individuals should also be early treated for HCV and HBV infections.

Key messages:

- The results of our study show that all populations should be target for HIV screening regardless of risk group.
- PLWHA coinfected with hepatitis B and hepatitis C should be also early treated for hepatitis coinfections.

1.K. Epidemiology and management of mental illness

Life events as predictors for depression in men and women: A Finnish twin study

Maarit Piirtola

M Piirtola[1], J Kaprio[1,2], O Kiviruusu[3,4], S Viertiö[3,4], J Suvisaari[3], M Marttunen[3,4], T Korhonen[1]
[1]Institute for Molecular Medicine Finland (FIMM), University of Helsinki, Helsinki, Finland
[2]Department of Public Health, University of Helsinki, Helsinki, Finland
[3]Mental Health, Department of Public Health Solutions, National Institute for Health and Welfare, Helsinki, Finland
[4]Psychiatry, University of Helsinki and Helsinki University Hospital, Helsinki, Finland
Contact: maarit.piirtola@helsinki.fi

Background:

Depression is more common in women than in men, but reasons for the sex/gender difference are not fully known. We analyzed sex/gender differences in the association of past life events (LE) with depression, and if the associations are independent of genetic liability.

Methods:

In the 2011 survey of the Finnish Twin Cohort (participation 72%, n = 8410, 45% men, mean age 60 yrs), depression was assessed using the Center for Epidemiologic Studies Depression (CES-D) scale (cut off value $\geq$20) showing depression in 13% (11% in men, 15% in women). LE were assessed as negative, positive, and serious (traffic accident, other accident, fire and natural catastrophe, physical abuse, sexual abuse, violent crime, and parental divorce) ones in childhood and/or in adulthood. Pearson's chi-squared test and age- and sex-adjusted logistic regressions were used to model the strength of associations. The effect of familial factors was tested using conditional logistic regression in 176 genetically identical (MZ) twin pairs (38% male) discordant for depression.

Results:

Women experienced more both negative LE (50%/42%, $p < 0.001$) and positive LE (60%/40%, $p < 0.001$) than men. Accidents, physical abuse and violent crime were reported more by men, but women reported more sexual abuse (14%/1%, $p < 0.01$). All LEs were associated with depression (adjusted Odds Ratios [OR] from 1.24, 95% Confidence Intervals [CI] 1.09 - 1.42 to OR 6.91, 95% CI 3.88 - 12.30). Women with physical abuse or violent crime in childhood or in adulthood were more vulnerable for depression than men. High magnitude of negative LEs in both sexes, low rates of positive LE in women, and physical abuse in women remained significantly associated with depression within MZ pairs suggesting independence from familial factors and genetic liability.

Conclusions:

We found sex difference in LE prevalence and in vulnerability for depression. These do not appear to be accounted for by familial effects.

Key messages:

- We found differences between women and men in life event prevalence and in vulnerability for depression.
- Differences in life experiences and exposures between women and men should be considered in prevention and treatment of depression.

The Economic and Mental Health Impact of IAPT: Pragmatic Trial in Three English Regions

Veronica Toffolutti

V Toffolutti[1,2], M McKee[2], DM Clark[3,4], D Stuckler[1,5]
[1]Dondena Centre, Universita Bocconi, Milan, Italy
[2]Department of Public Health and Policy, LSHTM, London, UK

[5]Department of Social and Political Science, Universita' Bocconi, Milan, Italy
Contact: veronica.toffolutti@unibocconi.it

Background:

Improving Access to Psychological Therapies (IAPT) programme is the English's major initiative for treating anxiety and depression, currently provided to over 1 million people.

We tested whether IAPT could reduce healthcare costs and improve employment in persons with long-term chronic conditions.

Methods:

Stepped-wedge design of two cohorts covering 560 patients each with depression and/or anxiety and comorbid long-term physical health conditions, namely diabetes, chronic obstructive pulmonary disease (COPD) and cardio-vascular disease (CVD) from three areas in Thames Valley (Berkshire, Oxfordshire and Buckinghamshire) for the period March 2017 - August 2017. Panels were balanced. Difference-in-difference models were used and intention-to-treat analysis.

Results:

Based on the step-wedge modelling, IAPT treatment decreased costs by £497 (95% CI: -£770 to -£224) total per person (pp) (from £1266 pp before starting the treatment to £768 pp since the treatment started)in the first 3 months. Results also showed a decrease by about 5.55 [95% CI: -6.35, -4.75] (-4.18 [95%CI: -4.91, -3.45]) points per person in the PHQ9 (GAD7). Our results show that IAPT increased the probability to an employment for those who were unemployment by about 7.92% (95% CI: 0.94% to 14.9%).

Conclusions:

IAPT treatment significantly reduced healthcare utilization and costs among persons with chronic conditions. It also significantly increased the probability of employment.

Key messages:

- IAPT treatment significantly reduced healthcare utilization and costs among persons with chronic conditions.
- IAPT was significantly associated with increased probability to find employment for those unemployed.

Are Patients with Subclinical Hypothyroidism at Risk of Depressive Symptoms?

Lea Wildisen

L Wildisen[1], *E Moutzouri*[1,2], *S Beglinger*[1,2], *L Syrogiannouli*[1], *S Klöppel*[3], *D Aujesky*[2], *N Rodondi*[1], *C Del Giovane*[1], *M Feller*[1,2]

[2]Department of General Internal Medicine, Inselspital, University of Bern, Bern, Switzerland
[3]University Hospital of Old Age Psychiatry, University of Bern, Bern, Switzerland
Contact: lea.wildisen@biham.unibe.ch

Introduction:

Subclinical hypothyroidism (SHypo) may be associated with negative health outcomes including depressive symptoms. However, the evidence is conflicting.

Methods:

We conducted a systematic review and individual participant data (IPD) meta-analysis to assess the association between SHypo and depressive symptoms. We requested IPD from cohorts identified through a systematic literature search. The exposure was thyroid function at baseline (SHypo vs. euthyroid; SHypo defined as thyroid stimulating hormone $\geq$ 4.5 mlU/L, in combination with normal free thyroxine). The outcome was depressive symptoms at first follow-up, measured on any validated scale. We calculated conversion factors to convert all scores into the Beck Depression Inventory (BDI) scale (range: 0-63, higher scores indicate more depression, minimal clinically important difference: 5). We performed a two-stage IPD meta-analysis. In each cohort, we estimated the mean difference (MD) in depressive symptoms scores between those with SHypo and euthyroid controls adjusted for depressive symptoms at baseline. Further, we adjusted the multivariable linear regression analysis for age, sex, education, and income. We pooled the study effect estimates by using a random effects model. Heterogeneity was assessed by I2.

Results:

Among six cohorts, we analyzed data from 23,367 participants (65% female, mean age 60.3±13.2 years, SHypo N = 1,463). There was no difference in BDI scores between SHypo (10.6) and controls (10.2) at baseline. After a mean follow-up of 8.2±4.3 years, BDI scores did not differ between SHypo and controls (pooled MD 0.3, 95% CI -0.2 to 0.7, I2 14%). Results remained robust in several sensitivity analyses, and no subgroup at increased risk for depressive symptoms could be identified.

Conclusions:

In this IPD meta-analysis, SHypo was not associated with the development of depressive symptoms. Depressive symptoms do not seem to be an indication for levothyroxine therapy in SHypo.

PROSPERO: CRD42018091627

Key messages:

- Individual studies about the association between subclinical hypothyroidism and depressive symptoms show conflicting results.
- In this IPD meta-analysis from six prospective cohort studies, patients with subclinical hypothyroidism did not have an increased risk to develop depressive symptoms during a mean follow-up of 8 years.

Effectiveness of Prompt Mental Health Care: Preliminary results from a randomized controlled trial

Marit Knapstad

M Knapstad[1,2], *LV Lervik*[2], *SMM Saether*[2], *LE Aaroe*[2], *ORF Smith*[2]
[1]Department of Clinical Psychology, University of Bergen, Bergen, Norway
[2]Department of Health Promotion, Norwegian Institute of Public Health, Bergen, Norway
Contact: marit.knapstad@uib.no

Background:

Prompt Mental Health Care (PMHC) service is a Norwegian initiative, adapted from the English ‘Improved Access to Psychological Therapy’ (IAPT), aimed at improving access to primary care treatment for anxiety and depression. Thus far, both PMHC and IAPT have been evaluated by cohort studies only. Albeit yielding promising results, the extent to which these are attributable to the treatment thus remains unsettled. This study investigates the effectiveness of PMHC compared to treatment as usual (TAU) at six months follow-up.

Methods:

Randomized controlled trial with parallel assignment in two PMHC sites from November 2015 to March 2018. Participants were 681 adults (aged $\geq$18 years) considered for admission to PMHC due to anxiety and/or mild to moderate depression. These were randomly assigned on a 70:30 ratio. Main outcomes were recovery rates and changes in symptoms of depression and anxiety between baseline and follow-up. Primary outcome data were available for 73%/67% in the PMHC/TAU group. Sensitivity analyses based on observed patterns of missingness were conducted.

Results:

A reliable recovery rate of 58.5% was observed in the PMHC group and 31.9% in the TAU group, yielding a between-group effect size (ES) of 0.61 [95% CI 0.37-0.85, p<.001]. The differences in degree of improvement between PMHC and TAU yielded an ES of -0.88 [95% CI -1.23-0.43, $p < 0.001$] for symptoms of depression and -0.60 [95% CI -0.90-0.30, $p < 0.001$] for symptoms of anxiety in favour of PMHC. All sensitivity analyses pointed in the same direction with small variations in point estimates. Findings were slightly more robust for depressive than anxiety symptoms.

Conclusions:

The PMHC treatment was substantially more effective than TAU in alleviating symptoms of anxiety and depression. This adaptation of IAPT is considered a viable supplement to existing health services to increase access of effective treatment for adults who suffer from anxiety and mild to moderate depression.

Key messages:

- This study is the first to evaluate the effectiveness of an IAPT-like treatment model in terms of a randomized controlled trial.

- Prompt Mental Health Care was substantially more effective than TAU in alleviating symptoms of depression and anxiety at 6-months follow-up.

Mental illness prevention in post-ACS men: A partcipatory action research

Jalila Jbilou

J Jbilou[1,2], *F Talbot*[2]
[1]Centre de formation médicale, Université de Moncton, Moncton, Canada
[2]École de Psychologie, Université de Moncton, Moncton, Canada
Contact: jalila.jbilou@umoncton.ca

Background:

The prevalence of social determinants of health (i.e. rurality, low education and poverty) among men put them at an elevated risk for comorbid cardiac disease and mental illness. While, men are particularly vulnerable to mental illnesses (i.e. depression, anxiety) after an acute coronary syndrome (ACS), they are typically averse to seeking medical care, especially for mental health issues. Targeting interventions to at-risk population groups is a well documented approach. However, little in the literature presents how to prevent mental illness in cardiac men. This study aims to develop, implement and pilot a psychoeducational program tailored for post-ACS men.

Methods:

A mixed method including a scoping review, a qualitative study and a quasi-experimental pilot study.

Results:

In total, 42 articles were retrieved to extract key components of cardiac men-sensitive psychoeducation programs. We led 22 focus groups and 14 semi-structured interviews (119 men in total). The mean age was 51.2 years [45-77]. We integrated the gathered data gathered from the scoping review and the qualitative study to develop a psychoeducational program (3 group sessions). The pilot study involved 48 men who completed the baseline, the 3-month and the 6-month data collections. We observed 80% of compliance. Findings show a significant improvement in PHQ-9, GAD-7, IES-R, CSI and EQ-5D scales. We also observed changes in the CMNI-22, a measure of attitudes, beliefs, and behaviors associated with both traditional and non-traditional masculine gender roles. Men appreciated the time flexibility (sessions were scheduled based on participants' availability) and the responsiveness of the sessions (content was discussed based on their needs and interests). Life partners were invited and 65% attended to all sessions.

Conclusions:

The program was a success and we expect to transform it into a peer-led intervention to improve its delivery in the community and its accessibility for rural and remote areas.

Key messages:

- At-risk population-sensitive approaches are key for compliance and effectiveness.
- Group sessions are effective approaches to improve men's mental heatlh literacy.

1.L. Cancer: epidemiology, screening and care

Economic burden of cancer from 2012 to 2017 based on the French national claim database (SNDS)

Dorian Verboux

D Verboux[1], *L Pestel*[1], *M Nicolas*[1], *T Lesuffleur*[1], *A Rachas*[1], *C Gastaldi-Menager*[1]
[1]Department of Studies on Diseases and Patients, Caisse Nationale d'Assurance Maladie, Paris, France
Contact: dorian.verboux@assurance-maladie.fr

Background:

The aim of this study is to assess the economic burden of active cancer in France and to analyze structure and trends of expenditure between 2012 and 2017.

Methods:

Using information about 57 millions of individuals from the general scheme insurance database (86% of the French population) and applying 5 specifically developed medical algorithms (for lung, colon, breast, prostate and other cancers), we identified all people with active cancer. All reimbursed expenditure (hospitalization, ambulatory care, disability/sickness benefits) were extracted for each individual. To analyze trends, we applied the same methodology from 2012 through 2017.

Results:

In 2016 (results for 2017 will be available for the conference), among the 137 billion euros reimbursed by the general assurance scheme, 13 billion (10%) were related to active cancer and 1.2 million people were concerned (2% of the population). About 2.3 billion euros (2%) were related to breast cancer (189,000 people), 1.4 billion euros (1%) for colon cancer (123,000 people), 1.4 billion euros (1%) for lung cancer (77,000 people) and 1 billion (0.8%) for prostate cancer (167,000 people). Hospitalizations represented the main expenditure for colon (71%), lung (61%) and breast cancer (56%). Concerning prostate cancer, hospitalizations stood for 36% while ambulatory care represented 62%. From 2012 to 2016, the expenditure related to active cancer increase by 4.4%/year due to both an increase in patients and in the average annual cost per patient (both +2.2% per year). Focusing on breast cancer, average expenditure increased by 3.2% per year from 10,700€ per year per patient to 12,200€ per year per patient.

Conclusions:

Our study demonstrates the high economic burden of active cancer in France with a detailed analysis of expenditures. The developed tool will help to monitor the burden of these diseases and to implement public health policies.

Key messages:

- Active cancers account for a significant proportion of healthcare expenditure in France.
- Knowing this weight allows designing and implementing public policies adapted to the situation.

Speedy, predictable and secure cancer care? Introducing cancer patient pathways in Norway

Line Melby

L Melby[1,3], *E Håland*[2]
[1]SINTEF, Trondheim, Norway
[2]Norwegian University of Science and Technology, Trondheim, Norway
[3]Norwegian University of Science and Technology, Gjøvik, Norway
Contact: line.melby@sintef.no

Norway introduced cancer patient pathways (CPPs) in 2015. CPPs are standardised patient pathways, based on current guidelines for cancer diagnostics and treatment. The aim is to speed up patient assessments and start of treatment and minimise waiting times, in order to make the assessment period as predictable as possible. Each CPP are divided into phases, and each phase should be completed within a defined time period. The aim of this paper is to describe and discuss how healthcare professionals work to realise the objectives of the CPPs and how they reflect upon them as tools for achieving predictable and secure cancer care.

The paper departs from an ongoing study (2017-2020) investigating the introduction of CPPs in Norway. The study has a qualitative cross-sectional design and focuses on four CPPs: breast-, prostate, and lung cancer, and malign melanoma. Data are mainly collected through interviews. The study setting is four hospitals, and study participants are hospital staff, including physicians, nurses, clerical workers and managers (N = 60).

Preliminary results show that keeping the waiting times has become a major concern, and national statistics are published showing if the hospitals keep the defined time limits. From the perspective of healthcare workers, CPPs may contribute to a predictable assessment period for patients, and thereby creating a more secure experience. However, predictability and security rest on patients being informed about receiving care organised through a CPP. We found that in many instances this was not the case.

Our study indicates that most effort in hospitals is directed towards reducing waiting times, and we argue that publishing of statistics may be an incentive for hospitals to reorganise their resources and prioritize cancer patients before other (elective) patients. Further development of the CPPs should encourage informing and supporting patients so they can have the most predictable and secure experience as possible.

Key messages:

- Patient pathways is an incentive to reorganise resources to reach defined time limits in cancer diagnostics.
- Short waiting times are positive for patients, even if survival rate is not necessarily affected.

Estimation of the epidemiological impact of the organized screening program for colorectal cancer

Stephanie Barre

S Barre[1]*, H Leleu*[2]*, S Taleb*[1]*, A Vimont*[2]
[1]French National Cancer Institute, Boulogne Billancourt, France
[2]Public Health Expertise, Paris, France
Contact: sbarre@institutcancer.fr

Introduction:

Colorectal cancer (CRC) is the third most common cancer and the second most deadly in France. A CRC national organized screening (OS) program was set up in France in 2009. It targets asymptomatic people aged 50 to 74 year with medium risk of CRC. OS program is based on fecal immunochemical test (FIT) followed by colonoscopy. Participation rate over the last period showed a participation rate of 34%, far from the European standards and the 45% target objective of the French cancer plan.

Methods:

he epidemiological impact of the DO-CCR was estimated from the results of an individual simulation model adapted from the MISCAN-Colon model, calibrated and transposed to the French context. The model simulates the natural history of CRC in a cohort of 5,000,000 individuals from birth to death. The simulated population reproduced the age and sex structure of the French population. Current screening strategy was simulated for the entire population. A first analysis was conducted to estimate the individual impact of screening by sex and by age of screening initiation and cessation. A second analysis was carried out to estimate the global impact of the based on various participation rates.

Results:

FIT every 2 years, from the age of 50, is associated with a reduction in the CRC incidence of 21% for women and 24% for men and a reduction in CRC mortality of 43% for women and 51% for men. At the current level of participation, the OS reduces incidence by 5% and mortality by 14% (2,200 CCR and 2,600 deaths per year) compared to no OS. The impact would be reduced by an additional 3% and 8% for participation rates of 45% and 65% respectively, a decrease of 1,300 and 3,500 cases per additional year. Similarly, mortality would decrease by an additional 8% and 22% for participation rates of 45% and 65%, respectively additional decreases of 1,400 and 4,000 deaths per year.

Key messages:

- These results confirm that in a population at medium risk for CRC, the OS is an effective strategy for reducing incidence of CRC.
- Increasing participation rate to reach the Cancer Plan's objectives remains a key issue in France.

Quantifying the impact of adherence to screening on colorectal cancer incidence and mortality

Elvira D'Andrea

E D'Andrea[1,2]*, DJ Ahnen*[3]*, DA Sussman*[4]*, M Najafzadeh*[2]
[1]Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy
[2]Division of Pharmacoepidemiology and Pharmacoeconomics, Department of Medicine, Brigham and Women's Hospital and Harvard Medical School, Boston, USA
[3]School of Medicine and Gastroenterology of the Rockies, University of Colorado, Denver, USA
[4]Division of Gastroenterology, Department of Medicine, University of Miami Miller School of Medicine, Miami, USA
Contact: elvira.dandrea@gmail.com

Background:

Current recommendations of The US Preventive Services Task Force (USPSTF) on colorectal cancer (CRC) screening strategies are based on models that assume 100% adherence to screening. Since adherence can largely affect the outcomes of a screening modality, we aimed to assess the comparative effectiveness of CRC screening strategies under published rates of actual adherence.

Methods:

We developed an individual-level simulation model and validated it against landmark trials and USPSTF models. Then we assessed the effectiveness of colonoscopy (COL), flexible sigmoidoscopy (FS), high-sensitivity guaiac fecal occult blood test (HS-gFOBT), fecal immunochemical test (FIT), multitarget stool DNA test (FIT-DNA), computed tomography colonography (CTC), and methylated SEPT9 DNA test (SEPT9) in reducing CRC incidence and mortality. For each strategy, we also estimated the incremental life-years gained, number of colonoscopies, and adverse events.

Results:

Assuming 100% adherence, FIT-DNA, FIT, HS-gFOBT, and SEPT9 averted 58 to 59 CRC cases and 28 CRC deaths; COL and CTC strategies 56 cases and 27 deaths, while FS averted 39 cases and 19 deaths per 1,000 individuals. Life-years gained were similar across FIT-DNA, FIT, HS-gFOBT, SEPT9, CTC, and COL strategies. The total number of colonoscopies was highest with COL (3,567), followed by SEPT9 (3,231), HS-gFOBT (2,584), FIT-DNA (2,079), FIT (2,067), CTC (1,691) and FS (1,538) strategies. Assuming actual adherence, SEPT9 averted 54 CRC cases and 26 CRC deaths, followed by COL with 49 cases and 24 deaths, and FIT-DNA, FIT, CTC and HS-gFOBT with approximately 36 to 41 cases and 18 to 21 deaths averted per 1000 individuals screened. Life-years gained reflected the effectiveness of each strategy in reducing CRC cases and deaths.

Conclusions:

Adherence is a key factor in determining the effectiveness of CRC screening and strategies with higher expected adherence rates have the potential to reduce cancer incidence and mortality.

Key messages:

- Adherence has a substantial impact on screening outcomes, such as cancer incidence and mortality, and may influence selection of optimal screening strategies.
- Strategies with higher expected adherence rates can lead to clinically meaningful benefits compared to strategies that may have better one-time sensitivity and/or specificity.

Barriers and facilitators on cervical cancer screening among HIV women in Cote d'Ivoire

Keitly Mensah

K Mensah[1], D Pourette[1], V Duschene[1], P DeBeaudrap[1], A Dumont[1]
[1]Centre Populations et Développement, IRD - Paris Descartes, Paris, France
Contact: keitly.mensah@gmail.com

Background:

With 50,000 death every year, cervical cancer is the fourth most common cause of death by cancer in sub-Saharan countries. Due to high risk human papilloma virus (hr-HPV) persistence on the cervix, leading to pre-malignous lesions, the disease is more frequent among HIV-positive women. In low- and middle-income countries, cervical cancer screening strategy relies on visual inspection with acetic acid, an operator-associated technic. As an alternative, HPV-based detection and its better performances are considered as it could lead to a potential screening uptake and women empowerment through self-sampling. Côte d'Ivoire, with a high HIV prevalence, is considering this innovative strategy. Yet, few studies analyzed the potential socio-cultural factors associated with cervical cancer screening in this context. Our study aims to assess beliefs and perceptions toward cervical cancer among HIV positive women in Abidjan, Côte d'Ivoire.

Methods:

We performed in-depth interviews with 21 HIV positive women randomly attending a health center or member of a women's association, in November 2018. All interviews were recorded and transcribed. A theoretical framework with the Health Belief Model and the PEN-3 was used to categorize women's perceptions, enablers, nurturers, perceived gravity and self-efficacy about cervical cancer, screening and self-sampling technique introduction.

Results:

Positive findings were knowledge about cervical cancer, awareness about women's vulnerability and HIV status role on it and relationship to caregivers. Fear appeared as a barrier to screening but also a facilitator among women with health awareness. Negative findings were reluctance for HIV-associated diseases, poor screening knowledge and lack of resources to get treated. Self-sampling introduction was disregarded due to lack of self-confidence.

Conclusions:

This study provides useful information for counselling and opens the door to HPV-based screening implementation.

Key messages:

- Beliefs and perceptions about cervical cancer screening among HIV women need to be assess before implementing a new strategy.
- Cervical cancer screening uptake will need to address fear, self-confidence and stigma.

Employment two years after breast cancer diagnosis: role of household characteristics, CANTO cohort

Elsa Caumette

Background:

Breast cancer is associated with a high 5-year survival rate and more than half women are still of working age at diagnosis. Many studies evaluated the clinical determinants of return to work (RTW) but few investigated RTW in relation to family factors. Our objective was to study the role of household characteristics in non-RTW two years after breast cancerdiagnosis.

Methods:

We used data of a French prospective cohort of women diagnosed with stage I-III, primary breast cancer (CANTO, NCT01993498). Patients had to be under 57 and have a job at diagnosis. We performed logistic regressions to model non-RTW two years after diagnosis in relation to household characteristics at diagnosis (marital status, children, support from partner), adjusting for tumor characteristics, health status at baseline and one year after diagnosis, and household income at diagnosis. In a second step, we conducted analyses stratified for household income at diagnosis.

Results:

In total, 1874 women were eligible. Being in a relationship did not impact non-RTW (OR = 1.43 [95% CI 0.95-2.16]). Among the 1566 women in a relationship, being married was associated with elevated odds of non-RTW(OR = 1.37 [0.96-1.94]). Having children(OR = 1.17 [0.81-1.69]) or receiving support from their partner (OR = 1.17 [0.77-1.78]) was not associated with non-RTW. However, the situation differed in low-income households(<2500€) among whom being married was associated with more elevated odds of non-RTW(OR = 1.94 [0.97-3.88]). No clear association was observed between having children (OR = 1.85 [0.85-4.03]) and non-RTW, but living with at least two children (OR = 2.76 [1.14-6.70]) and receiving support from their partner (OR = 2.28 [1.01-5.17]) was associated with increased odds of non-RTW.

Conclusions:

The family environment is associated with non-RTW among the poorest women but not the others.

Key messages:

- Among the poorest women, the family environment is associated with non-RTW.
- Among all women, the family environment is not associated with non-RTW.

The effect of breast cancer on work participation in different sectors. A Danish registry based study

Laura Jensen

L Jensen[1], H Bøggild[2], C Overgaard[2], K Fonager[1,3]
[1]Department of Social Medicine, Social Medicinsk Afdeling, Aalborg Sygehus, Aalborg, Denmark
[2]Public Health and Epidemiology Group, Department of Health, Science and Technology, Aalborg University, Aalborg, Denmark
[3]Department of Clinical Medicine, Aalborg University, Aalborg, Denmark
Contact: lssj@rn.dk

Background:

A breast cancer diagnosis affects an individual's affiliation to the labor market, but whether the effect of breast cancer variates in different sectors in a Danish setting has not been examined. The present study investigated the effect of stage IA breast cancer (tumor<20 mm and no lymph nodes involved in six sectors among Danish women being part of the work force. Stage IA breast cancer has a good prognosis, and it would be assumed that the majority have returned to work after 1 year.

Methods:

This registry-based cohort study was based on data from linked Danish nationwide registries. We identified 5,543 women (aged 25-63 years) diagnosed with breast cancer (BC) stage IA (exposed) and 65.889 women without breast cancer (unexposed) and included women from the different sectors. We calculated a yearly Work Participation Score (WPS), defined as the proportion of weeks being self-supported during a year. We compared the means of WPS for exposed and unexposed women in six different sectors: 1) teaching, 2) childcare, 3) eldercare, 4) cleaning, 5) administration and 6) hospitality industry.

Results:

BC had a negative effect on being self-supporting for women in all six sectors in all three years, although the effect declined. In the first year, the difference in WPS varied between 0.38 and 0.54. During the second year all BC patients had still significantly lower WPS with the largest difference in hospitality industry (0.65 (95% CI 0.50-0.80) for exposed women and 0.86 (95% CI 0.83-0.88) for unexposed women). In the third year, the effect further declined although WPS was still significantly lower for most sectors with the biggest difference in the cleaning sector.

Conclusions:

A stage IA BC diagnosis had a negative effect on being self-supportive after 2 and 3 years among women in all six sectors, although the difference was largest among cleaning workers. This may indicate, that individual follow-up in relation to work participation is necessary.

Key messages:

- Although breast cancer stage IA has a good prognosis, it still affects being self-supporting after three years.
- A diagnosis of breast cancer affects the affiliation to the labour market, but the effect differs according to different sectors.

Socio-economic position across the lifecourse and risk of breast cancer: findings from EPIC-Italy

Eloïse Berger

Contact: eloise.berger@univ-tlse3.fr

Backgrounds:

Socio-economic position (SEP) is linked to many health outcomes but the link between SEP and breast cancer (BC) is complex. This study explores the relationship between SEP from early life and future risk of BC.

Methods:

We used data from the Italian component of the European prospective investigation into cancer and nutrition: EPIC-Italy (up to 26,391 women). Cox proportional hazard models were used to estimate the association between measures of life course SEP (father's occupation, educational level, highest household occupation) with risk of BC, adjusting for health behaviours (smoking, alcohol, physical activity, Mediterranean diet), height, weight and reproductive factors (postmenopausal status, age at first full term pregnancy). To mimic life course experiences, we analysed the relationship between father's occupation and risk of BC, sequentially adjusting for SEP in young adulthood and adulthood, as well as the impact of social mobility.

Results:

We observed a significant association between father's occupation and risk of BC, where participant with low SEP had lower risk to develop BC (HR[95%CI] = 0.88[0.78; 0.99]). This association was borderline significant when we analysed educational level and highest household occupation. These associations were only slightly modified after adjustment for health behaviours, height and weight but more strongly affected by reproductive factors. However, the association between father's occupation and BC remained borderline significant in the fully adjusted model (HR[95%CI] = 0.91[0.80; 1.03]). Stable low trajectory showed a lower risk of BC (HR[95%CI] = 0.82[0.71; 0.96]) slightly attenuated after adjusted for reproductive factors (HR[95%CI] = 0.88 [0.75; 1.03]).

Conclusions:

Our findings suggest that low early-life SEP and stable low trajectory are associated with a lower risk of BC, which is partly explained by reproductive factors.

Key messages:

- Low early life socioeconomic position and stable low trajectory are associated with a lower risk of BC.
- Reproductive factors, especially age at the first full term pregnancy, explain part of these associations.

1.M. Globalisation, dietary evolution and health

Ultra-processed food intake and cardiovascular disease risk in the NutriNet-Santé prospective cohort

Bernard Srour

B Srour[1], LK Fezeu[1], E Kesse-Guyot[1], B Allès[1], E Chazelas[1], M Deschasaux[1], S Hercberg[1,2], CA Monteiro[3], C Julia[1,2], M Touvier[1]
[1]Inserm, Nutritional Epidemiology Research Team (EREN), INSERM, University of Paris 13, Bobigny, France
[2]APHP, Public health department, Avicenne hospital APHP, Bobigny, France
[3]University of Sao Paulo, University of Sao Paulo - Department of Nutrition and Public Health, Sao Paulo, Brazil
Contact: b.srour@eren.smbh.univ-paris13.fr

Objective:

To assess the prospective associations between consumption of ultra-processed foods (UPF) and the risk of cardiovascular diseases.

Methods:

105159 participants aged at least 18 years (median age 41.5 years) from the French NutriNet-Santé cohort (2009-2018) were included. Dietary intakes were collected using repeated 24 hour dietary records, designed to register participants' usual consumption for 3300 different food items, and categorized according to their degree of processing by the NOVA classification. Associations between UPF intake and risk of cardiovascular, coronary heart, and cerebrovascular diseases assessed by multivariable Cox proportional hazard models, adjusted for known risk factors.

Results:

UPF intake was associated with higher cardiovascular disease risk (n = 1409 cases; HR for an absolute increment of 10 in the percentage of UPF = 1.12(1.05-1.20); P = 0.0008), coronary heart disease risk (n = 665 cases; HR = 1.13(1.02-1.24); P = 0.02), and cerebrovascular disease risk (n = 829 cases; HR = 1.11(1.01-1.22); P = 0.02). These results remained statistically significant after adjustment for several markers of the nutritional quality of the diet (saturated fatty acids, sodium and sugar intakes, dietary fiber or a Healthy pattern derived by principal component analysis) and after a large range of sensitivity analyses.

Conclusions:

In this large observational prospective study, higher consumption of UPF was associated with higher risks of cardiovascular, coronary heart, and cerebrovascular diseases. These results need to be confirmed in other populations and settings, and causality remains to be established.

Key messages:

- The consumption of ultra-processed food is associated with an increased risk of cardiovascular diseases. As the French Public Helath agency recommends, their consumption should be limited.
- Nutritional composition, food additives, contact materials, or neoformed contaminants might play a role in these

associations and further studies are needed to understand their relative contribution.

Traditional Eastern European diet and its relationship with mortality: results from the HAPIEE study

Denes Stefler

D Stefler[1], D Brett[2], E Sarkadi Nagy[3], E Kopczynska[4], S Detchev[5], A Bati[6], S Malyutina[7,8], R Kubinova[9], A Pajak[10], M Bobak[1]

[9]National Institute of Public Health, Prague, Czech Republic
[10]Department of Epidemiology and Population Studies, Jagiellonian University Collegium Medicum, Krakow, Poland
Contact: denes.stefler@ucl.ac.uk

Background:

Cardiovascular disease (CVD) and cancer mortality rates in Eastern European countries are among the highest in the world. Although unhealthy diet is an important risk factor for both of these chronic diseases, traditional eating habits and their health effects in this region have not yet been explored. This analysis assessed the relationship between traditional dietary pattern and mortality from all-causes, CVD and cancer in Eastern European population-based cohorts.

Methods:

We used data from the Health, Alcohol and Psychosocial factors in Eastern Europe (HAPIEE) multi-centre prospective cohort study based in Russia, Poland and the Czech Republic (age range at baseline: 45-70 years). Diet was assessed by food frequency questionnaire, and we constructed an Eastern European diet score (EEDS) from nine food groups considered as ‘‘traditional’’ in this region. The relationship between EEDS and all-cause, CVD and cancer mortality was calculated with Cox-regression models.

Results:

From the 18,852 participants, 2,234 died during the average follow-up of 11.7 years. In multivariable adjusted models, participants with high adherence to the traditional Eastern European diet had significantly higher risk of all-cause (HR 1.20; 95% CI 1.05-1.38) and CVD deaths (1.32; 1.05-1.64) compared to those with low adherence. The association with cancer mortality was not significant (1.12; 0.90-1.40). From the specific EEDS components, high consumption of lard was significantly positively related to all three mortality outcomes, while processed fruit or vegetable consumption showed consistent inverse associations.

Conclusions:

Our results suggest that traditional eating habits may contribute to the poor health status, particularly the high CVD mortality rates, of populations in Eastern Europe. Adequate public health nutritional interventions in this region are essential.

Key messages:

- This work indicates that traditional dietary habits in Eastern European countries may be one of the reasons for the poor health status of populations in this region.
- Public health nutritional interventions which target traditional but unhealthy foods, such as lard, have the potential to considerably improve population health in Eastern Europe.

Mediterranean diet and risk of first hospitalization for heart failure and atrial fibrillation

Licia Iacoviello

M Bonaccio[1], A Di Castelnuovo[2], S Costanzo[1], E Ruggiero[1], M Persichillo[1], A De Curtis[1], C Cerletti[1], MB Donati[1], G de Gaetano[1], L Iacoviello[1,3]
[1]Epidemiology and Prevention, IRCCS NEUROMED, Pozzilli, Italy
[2]Cardiocentro, Mediterranea, Naples, Italy
[3]Medicine and Surgery, University of Insubria, Varese, Italy
Contact: licia.iacoviello@moli-sani.org

Background:

We aimed to explore the association of a traditional Mediterranean diet (MD) with risk of first hospitalization for heart failure (HF) or atrial fibrillation (AF) in a population-based cohort from a southern Italian region.

Methods:

Longitudinal analysis on 20,598 men and women (aged$\geq$35 y) free from HF, AF and cardiovascular disease recruited in the Moli-sani Study (2005-2010). First hospital admissions for HF or AF were recorded by direct linkage with hospital discharge form registry. Dietary data were collected by the EPIC food frequency questionnaire, adherence to MD was appraised by the Greek Mediterranean diet score (MDS ranging 0-9). Hazard ratios (HR) with 95% confidence interval (95%CI) were calculated by multivariable Cox-regression.

Results:

Over a median follow up of 8.2 y, we ascertained 661 HF events and 337 AF cases. A 2-point increase in the MDS was associated with a downward trend in the risk of developing HF (HR = 0.94;0.85-1.04) after adjustment for potential confounders, while no association was found with risk of AF (HR = 1.07;0.94-1.21). Analyses run separately by gender revealed that higher adherence to an MD was associated with lower risk of HF among women (HF = 0.83;0.72-0.95 for 2-point increase in the MDS) but not in men (HR = 1.07;0.93-1.22; p for interaction = 0.011). No gender-related difference was observed for AF risk (p for interaction = 0.62). Among women, higher intake of monounsaturated over saturated fats was associated with 38% (20% to 52%) lower risk of HF, while in men moderate alcohol intake was likely to reduce HF risk (HR = 0.87;0.70-1.08).

Conclusions:

Closer adherence to a traditional MD is associated with lower risk of first hospitalization for HF among women but not in men. No association was found with risk of AF.

Key messages:

- A traditional MD reduces the risk of HF in women but not in men.
- Minor dietary changes inspired to a traditional MD could be valuable primary prevention measures for risk of HF.

Association between fast-food outlet exposure and Body Mass Index in 124,286 Lifelines participants

Carel-Peter van Erpecum

CL van Erpecum[1], SKR van Zon[2], U Bültmann[2], N Smidt[1]
[1]Department of Epidemiology, University Medical Center Groningen, University of Groningen, Groningen, Netherlands
[2]Department of Health Sciences, University Medical Center Groningen, University of Groningen, Groningen, Netherlands
Contact: c.p.l.van.erpecum@umcg.nl

Background:

Elevated Body Mass Index (BMI) is a key risk factor for numerous non-communicable diseases, such as cardiovascular diseases, cancer, diabetes type II and dementia. Previous studies showed associations between fast-food outlet exposure and BMI, but contained methodological shortcomings. Particularly within the Netherlands, evidence is scarce. We aimed to examine the association between fast-food outlet exposure and BMI among the Dutch adult general population, and whether this association was mediated by daily caloric intake.

Methods:

Cross-sectionally linking baseline adult data (N = 124,286) from the Lifelines cohort to fast-food outlet location (LISA: employer register) data, we regressed fast-food outlet density (within distances of 500 metre(m), and 1, 3, and 5 kilometre (km)) and fast-food outlet proximity around participants' residential address on BMI. We used multilevel regression and multilevel mediation models, adjusting for age, sex, partner status, education, employment, neighbourhood deprivation and neighbourhood address density. We stratified analyses for urban and rural areas, as these involve different living environments and study populations.

Results:

More than half (56%) of participants was overweight (BMI $\geq$ 25.0). The average BMI in urban and rural areas was 25.9 (SD 4.4) and 26.3 (SD 4.3), respectively. In rural areas, having at least three fast-food outlets within 500 m was associated with higher BMI (B = 0.17, 95% confidence interval (CI): 0.06, 0.28). In urban areas, having at least five fast-food outlets within 1 km was associated with higher BMI (B = 0.42, 95% CI: 0.20, 0.63). Having the nearest fast-food outlet within 100m was associated with higher BMI (B = 0.43, 95% CI: 0.19, 0.67). The associations were partly explained by daily caloric intake.

Conclusions:

Fast-food outlet exposure may be an important environmental determinant of BMI. Policy-makers should consider intervening upon the fast-food environment.

Key messages:

- Fast-food outlets within 500 metres in rural areas and 1 kilometre in urban areas may play a fundamental role in the rise of BMI.
- Targeting fast-food outlets may be key to reduce BMI on a population level.

1.N. Health literacy

Evaluation of Education for Public Health: A Practical Foundation for Solidarity

Mikko Perkiö

M Perkiö[1], R Harrison[2], M Grivna[3], D Tao[4], C Evashwich[5]
[1]Tampere University, Tampere, Finland
[2]Manchester University, Manchester, UK
[3]United Arab Emirates University, Al Ain, United Arab Emirates
[4]Saint Louis University, Saint Louis, USA
[5]George Washington University, Washington, DC, USA
Contact: mikko.perkio@tuni.fi

Education is a key to creating solidary among the professionals who advance public health's interdisciplinary mission. Our assumption is that if all those who work in public health shared core knowledge and the skills for interdisciplinary interaction, collaboration across disciplines, venues, and countries would be facilitated. Evaluation of education is an essential element of pedagogy to ensure quality and consistency across boundaries, as articulated by the UNESCO education standards. Our study examined the evaluation studies done by programs that educate public health professionals.

We searched the peer reviewed literature published in English between 2000-2017 pertaining to the education of the public health workforce at a degree-granting level. The 2442 articles found covered ten health professions disciplines and had lead authors representing all continents.

Only 86 articles focused on evaluation. The majority of the papers examined either a single course, a discipline-specific curriculum or a teaching method. No consistent methodologies could be discerned. Methods ranged from sophisticated regression analyses and trends tracked over time to descriptions of focus groups and interviews of small samples. We found that evaluations were primarily discipline-specific, lacked rigorous methodology in many instances, and that relatively few examined competencies or career expectations.

The public health workforce enjoys a diversity of disciplines but must be able to come together to share diverse knowledge and skills. Evaluation is critical to achieving a workforce that is well trained in the competencies pertinent to collaboration. This study informs the pedagogical challenges that must be confronted going forward, starting with a commitment to shared core competencies and to consistent and rigorous evaluation of the education related to training public health professionals.

Key messages:

- Rigorous evaluation is not sufficiently used to enhance the quality of public health education.
- More frequent use of rigorous evaluation in public health education would enhance the quality of public health workforce, and enable cross-disciplinary and international collaboration for solidarity.

We're making individuals more ''health literate'' but what about communities?

Candan Kendir

Dr Kendir[1], Dr Breton[2,3]
[1]Ecole des Hautes Etudes en Sante Publique (EHESP), Saint Denis, France
[2]Ecole des Hautes Etudes en Sante Publique (EHESP), Rennes, France
[3]Laboratoire Arènes (UMR CNRS 6051), Rennes, France
Contact: candankendir@hotmail.com

Health literacy (HL) is increasingly hailed as a strategy to improve the control individuals have over their health. So much so that HL is now ranked as a determinant of population health. A central critic of HL intervention is its over emphasis on individual level factors something recognised in the 2008 report of the Commission of Social Determinants of Health (SDoH) that recommended expanding the scope of HL to cover the SDoH.

Our objective of our study was to assess the extent to which recent progress on HL captures the need for collective action on the SDoH.

We conducted a scoping review on PubMed looking for review papers, published between 2013-2018 in English and French. The reference lists of the papers were also searched to find other relevant articles. The WHO website was also consulted. The most cited definitions were analysed against two main dimensions (i.e. locus of change of HL strategies and foreseen outcome of HL improvements).

We identified 419 articles. Despite a number of authors calling for more research on HL interventions at the community level and an expansion of the definition to cover the SDoH, we found that the recommendation of the Commission has yet to be implemented. Even when the definitions include the capacities of individuals on distal determinants, both the locus of change and outcomes of HL improvement stayed focused on intra individual factors. It is noteworthy that communities were either framed as a setting outside of health care services or as an aggregate of individuals. We found no instance of HL intervention regarding communities as complex systems of actors sharing a common space and dynamic.

We conclude by drawing attention on the research gap in addressing the upstream SDoH through HL actions. We propose some elements of definition of HL reflecting the need for interventions to build capacities for collective action on the SDoH and develop measurements at the community level.

Key messages:

- Research and practice have yet to embrace the contribution of HL in addressing the upstream SDoH.
- There is a large research gap on how HL can build collective capacities on addressing the SDoH.

Building bridges takes time: Views of healthcare professionals on health literacy and migration

Annika Baumeister

A Baumeister[1,2]*, A Aldin*[3]*, D Chakraverty*[4]*, ÜS Seven*[4]*, G Anapa*[4]*, T Jakob*[3]*, N Skoetz*[5]*, E Kalbe*[4]*, C Woopen*[1,2]

[5]Department I of Internal Medicine, Cochrane Cancer, Center for Integrated Oncology Aachen Bonn Cologne Duesseldorf, University of Cologne, Medical Faculty and University Hospital of Cologne, Cologne, Germany
Contact: annika.baumeister@uk-koeln.de

Background:

Health literacy is an output of individual resources and capabilities, situational factors, environmental conditions, and the requirements of the health care system. As migration continues to increase globally, successful interaction between healthcare professionals and migrants can be important for a sustainable and resource-oriented promotion of health literacy. This study aims to explore challenges, needs and applied solutions of healthcare professionals in the interaction with migrants in Germany.

Methods:

Five focus group discussions were conducted in Cologne, Germany. Participants were healthcare professionals (n = 30), including general practitioners, medical specialists in inpatient and outpatient care, and nurses. Discussions were audio recorded, transcribed verbatim and analysed by qualitative content analysis.

Preliminary results:

Participants reported a lack of time and general uncertainty in dealing with the health literacy-related needs of the target population. Assumptions on discrimination through the health system and restrictive gender roles on the patients' side were additional key challenges for a successful interaction. To bridge these barriers, some participants reported to invest time even beyond systemic conditions; most wished for professional interpreters or cultural mediators. Participants who themselves were migrants found this helpful for communicating information to patients and improving patients' confidence in the recommended treatment. Using clinical staff as lay interpreters outside their own treatment situation was rated critical, as it can be associated with a considerable burden due to a further time restriction for their actual tasks.

Conclusions:

Preliminary findings reveal that general problems in the health care setting (e.g. time pressure, ensuring patients' compliance) can occur more intensively in migrant patients. Health professionals require support through the provision of state-funded professional interpreters.

Key messages:

- Health literacy related challenges become more visible in the context of migration and reveal general issues in the German health system that need to be solved for the benefit of the entire population.
- Research on health literacy in the context of migration is important in order to ensure the promotion and maintenance of health equally and effectively across populations.

Potentials of school nursing for strengthening health literacy: a 2017/18 German longitudinal survey

Elke de Buhr

E de Buhr[1,2]*, A Tannen*[1]
[1]Institute for Health and Nursing Science, Charité Universitätsmedizin Berlin, Berlin, Germany
[2]School of Public Health and Tropical Medicine, Tulane University, New Orleans, USA
Contact: elke.debuhr@gmail.com

Background:

Health literacy (HL) plays a key role in explaining health disparities. School nurses provide health related expert knowledge and skills within the school setting. A positive effect on the HL of children but also their teachers and parents is assumed and supported by some research but gaps persist in the available data.

Methods:

As part of a pilot school nursing project, which placed school nurses in 28 public schools in two German states, all teachers, parents and students (11+ years) attending the schools were invited to participate in a 2017 baseline (T0) and 2018 follow-up (T1) survey. Adult HL was measured using the HLS-EU-Q16 and child HL with the HLSAC. Bi- and multivariate analyses were carried out.

Results:

Comparing T0 and T1, HL scores improved in all populations. In East Germany (Brandenburg), the percentage of teachers with problematic or inadequate HL decreased from 56.6 (N = 173) to 51.5 (N = 173) and among parents from 45.7 (N = 1719) to 43.2 (N = 1080). In West Germany (Hessen), the percentage of teachers with problematic or inadequate HL also decreased, from 43.7 (N = 201) to 42.2 (N = 263), and among parents from 42.2 (N = 2013) to 34.9 (N = 1251). The percentage of children that scored in the moderate or high HL brackets increased from 77.9 (N = 898) to 82.2 (N = 736) in Brandenburg and from 84.9 (N = 1379) to 86.5 (N = 1487) in Hessen. There were strong statistical relationships between child/parental HL and child health behaviors in all datasets. The T0 and T1 comparison showed some improvements over time.

The presence of school nurses in public schools seemed to increase health awareness, thus contributing to a ''healthy school.'' After a short period (18 months) and despite a rather nonspecific spectrum of interventions, the HL of all relevant target groups improved. Further research is needed to quantify the relative contribution of the school nurses to improvements in HL, for example, by implementing a HL curriculum in a controlled setting.

Key messages:

- The presence of a school nurse seemed to increase health awareness contributing to a ''healthy school.''
- After 18 months of intervention, the health literacy of children, parents and teachers improved.

Social gradient in health literacy among primary healthcare users in Cyprus

Christiana Nicolaou

N Andreou[1]*, C Nicolaou*[1]*, E Papastavrou*[1]*, N Middleton*[1,2]
[1]Department of Nursing, School of Health Sciences, Cyprus University of Technology, Limassol, Cyprus
[2]Cyprus Institute for Environmental and Public Health, Cyprus University of Technology, Limassol, Cyprus
Contact: c.nicolaou@cut.ac.cy

Background:

Health literacy (HL) is a critical determinant of health and citizens' control over their health. The European Health Literary consortium developed a conceptual model and related HLS-EU-Q47 tool of four cognitive and three health domains and showed high levels of inadequate HL in eight European countries.

Methods:

This methodological and descriptive study evaluated the metric properties of the tool in a new setting and assessed HL among a Greek-Cypriot population. Differences in HL by social position and health behaviours was assessed.

Results:

A sample of 300 adults from a General Hospital participated, 65%:35% urban vs rural, 15.3% divorced/widowed, 33% tertiary education, as expected according to census. 53% rated their health as ''less than good'', 45.6% were current or past smokers and mean BMI was 26.8 (SD 5.2). Cronbach's alpha coefficient for internal consistency was >0.80 for cognitive (access, understand, appraise, and apply) and health sub-scales (healthcare, prevention, health promotion). A three factor structure explaining 52.1% of the variance was identified in exploratory factor analysis (''access to information'', ''prevention and promotion-related literacy'' and ''user-provider interaction''). Half of the participants (50.7%) reported inadequate or problematic HL with statistically lower HL in older age-groups but no difference by urban: rural status. A clear social gradient was observed by education, income and subjective social position on a 10-step ladder. Regular alcohol consumption and low physical exercise were related with low HL, but not smoking or BMI.

Conclusions:

HLS-EU-Q47 showed good metric properties in a new language and setting. The proportion of population with inadequate or problematic HL appears high but consistent with findings from other European populations. The observed social gradient in HL supports the criterion known-group validity of the tool as well as highlights an important aspect of health inequality.

Key messages:

- There is support for HLS-EU-Q47 as a valid and reliable measure of health literacy.
- A high proportion of the Cypriot population with problematic health literacy with a clear social gradient.

Association between occupational situation and health literacy: A Danish population-based survey

Gabriele Berg-Beckhoff

I Wagner Svendsen[1], M Busk Damgaard[1], C Kronborg Bak[2], M Tang Svendsen[3], G Berg-Beckhoff[1]
[1]Unit for Health Promotion Research, University of Southern Denmark, Esbjerg, Denmark
[2]Development and Research Unit, University college UCSYD, Haderslev, Denmark
[3]Centre for Clinical Research, North Denmark Regional Hospital, Aalborg, Denmark
Contact: gberg-beckhoff@health.sdu.dk

Background:

It is well known, that health literacy is associated with health, and that occupation and health is associated as well. But current knowledge on the relationship between occupation and health literacy is scarce. The aim of this study was to examine the association of occupation with health literacy.

Methods:

Between 2016 and 2017 a random sample of the Danish population participated in a cross-sectional national representative survey using the short version of the European Health Literacy Survey Questionnaire. 15,682 adults aged 25 years or older was invited, and 8,997 residents participated. Data on occupational situation were obtained from nationwide administrative registries, which contains information on employment and public benefits. Logistic regression was conducted for the binary outcome of health literacy and the exposure variable of occupational situation. Model was adjusted for sex, age, immigration, education, cohabitation and income. Subsequently, a mediation analysis was conducted to analyze if health literacy was a causal pathway in the association between occupational situation and health.

Results:

Respondents receiving unemployment benefits had a significantly higher risk of inadequate health literacy [OR = 1.66 ($p < 0.001$)] compared to respondents who were employed. The associations were also significant for social assistance [OR = 1.63 ($p < 0.001$)], employment and support allowance [OR = 1.59 ($p < 0.001$)], and sickness benefit [OR = 1.55 ($p < 0.001$)]. Mediation analysis showed, that the association between employment status and health were partly mediated by health literacy.

Conclusions:

Results are important to understand the health disparities in connection to occupational situation, health literacy, and health. As a mean for health promotion, interventions to improve health literacy should be planned for groups receiving public benefits and when health information is delivered for these groups the level of health literacy should be considered.

Key messages:

- Association between employment status and health were partly mediated by health literacy.
- Interventions to improve health literacy should be planned for groups receiving public benefits.

Digital health literacy of health care profession students

Julia Dratva

J Dratva[1,2], S Juvalta[1], M Gemperle[3], D Händler-Schuster[4], M Scheermesser[5], V Klamroth-Marganska[6]
[1]Institute of Health Sciences, ZHAW School of Health Professions, Winterthur, Switzerland
[2]Medical faculty, University of Basel, Basel, Switzerland
[3]Institute of Midwifery, ZHAW School of Health Professions, Winterthur, Switzerland
[4]Institute of Nursing, ZHAW School of Health Professions, Winterthur, Switzerland
[5]Institute of Physiotherapy, ZHAW School of Health Professions, Winterthur, Switzerland
[6]Insitute of Occupational Therapy, ZHAW School of Health Professions, Winterthur, Switzerland
Contact: julia.dratva@zhaw.ch

Background:

Digital transformation in health and health systems is a chance and a challenge for health professionals irrespective of their field. To maximize the benefit for patients high digital health literacy is required. A requirement not represented in health professions' curricula in Switzerland. Little is known on the digital health competencies of students, on their utilization and views of digital media in the context of health, thus a cross-sectional survey was performed at a School of Health Professsions in Switzerland.

Methods:

All BSc. students (N = 1200; nursing, midwifery, occupational health, physiotherapy and health promotion) received an online questionnaire covering utilization of various information resources, views on digital health & media and the German eHealth Literacy Scale (eHEALS, score 0 - 40). Descriptive and group analyses were performed, further adjusted analyses will be run.

Results:

453 students responded (female N = 368, male N = 26). Participation was 38% and highest in 1st students. Personal health information resources used most were: internet 82%, familiy&friends 70%, health professionals 66%, textbooks 40%. A majority rated digital media as important (66%) or rather important (30%) for their future professional activities. The overall eHeals-score was 28.6 (sd 4.93); critical evaluation and confidence in applying information scored lowest. Preliminary group analyses show significant increase by study year (1st 28.0, 2nd 28.9, 3rd 29.7, p = 0.01), while scores by gender or health profession were non-significantly different.

Conclusions:

Almost all students in health professions use digital media for their own health information needs and consider digital media as highly relevant for their future career. Critical evaluation skills need to be strenghtend. Digital Health Literacy is only slightly higher in 3rd year students. Longitudinal data are needed to differentiate cohort from learning effects.

Key messages:

- Digital media are increasingly important in health systems, a view shared by future health professionals. Data indicate only a small increase of digital health literacy across three years of study.
- Curricula should include digital health competencies to ensure a highly digitally skilled health work force.

Information seeking and knowledge on in-home care services in a representative sample in Switzerland

Sarah Mantwill

S Mantwill[1], *K Dawson-Townsend*[1]

[1]Department of Health Sciences and Health Policy, University of Lucerne, Lucerne, Switzerland

Contact: Sarah.Mantwill@unilu.ch

Background:

In Switzerland the use of in-home care services has increased steadily in recent years. Contributing to this trend are a growing aging population and changing family structures. In-home care services are embedded in complex financing systems, which require considerable efforts and capacities to navigate, and if not well understood, can lead to inefficient usage of healthcare services. The aim of this study is to assess information seeking behavior and knowledge on in-home care services in the Swiss general population.

Methods:

Data comes from a cross-sectional online survey, using a representative sample from Switzerland (N = 1050), conducted in September 2018. The survey included items on information seeking behavior (sources, difficulties seeking information), as well as general and financial knowledge on in-home care services.

Results:

50.1% had sought information on in-home care services at least once. Logistic regression shows that age (β = .01, p<.005) and gender are significant predictors for information seeking, with women being more likely to have sought information (β = .26, p<.05). Those with highest education are less likely to have sought information (β = -.55, p<.05). About 1/4 of participants indicate having had some difficulty when seeking information, including being worried about the quality of information. 84.8% indicate to have at least some knowledge about in-home care financing. Whereas the majority is relatively well informed on the financing of in-home care services, such as ‘‘acute and transitional care’’, participants have overall relatively little knowledge on additional financing mechanisms, such as supplemental benefits. Multiple regression shows that age significantly predicts financial knowledge (β = .04, p<.001).

Conclusions:

The study shows that knowledge gaps exist, which may hinder effective and efficient use of in-home care services, as well as a potential lack of available and clear information to make appropriate decisions on services.

Key messages:

- Important knowledge gaps on in-home care services exist in Switzerland.
- The study indicates a potential lack of available and easy-to-understand information on in-home care services in Switzerland.

1.O. Workshop: Building bridges between environmental and Public Mental health

Organised by: EUPHA (PMH), EUPHA (ENV)
Chair persons: Jutta Lindert - EUPHA (PMH), Marija Jevtic - EUPHA (ENV)
Contact: Peter.van.den.Hazel@vggm.nl

Scope and extent as well as duration of mental health and mental disorders are influenced by various factors, such as environmental factors. Environmental factors relate to physical, chemical and built environment. We aim to build knowledge by providing 1) a case study on perception of climate change and possibilities and limitations of adaptation, 2) a review on mental and neuropsychiatric disorders in the light of the SDGs framework and 3) give an overview of research methods both, in environmental epidemiology and in neuropsychiatric epidemiology. By bringing together the two fields of expertise and the members of the section of Environment and Health and of Public Mental health we will not only build bridges between individuals but between disciplines which might lead to a joint research agenda.

Key messages:

- The scope of mental health changes with changes in the environment.
- Knowledge provides a strong bridge to link the environment with mental disorders.

Prevention of mental health effects by climate change and environmental drivers

Peter Van Den Hazel

P Van Den Hazel[1]

[1]Environment and Health, Public Health Services Gelderland-Midden, Arnhem, Netherlands

Contact: peter.van.den.hazel@vggm.nl

Background:

There is a growing amount of climate change and health data available in open sources. Inhabitants value their neighbourhood mostly by perception. Local authorities make spatial planning discussions based on environmental data. In the case of heat waves more climate adaptation measures are taken by authorities. However, there is a gap in knowledge on the need for adaptation of our environment and the perception of a growing proportion of the population on the need for adaptation. Furthermore, there is little focus on the mental problems related to climate change. The example of heat wave adaptation has been studied.

Methods:

Heat wave plans across Europe have been analysed on participatory processes by the population or by broader group of stakeholders in the health care sector. The existing plans of 20 countries were collected. Interviews with key-persons involved in the implementation of these plans were used. The perception of the population on the measures, the mentioning of individual or group resilience and for mental disturbances during or in the aftermath of a heat wave were studied.

Results:

The results show limited attention for the participatory process in heat wave plans. There is no attention for mental problems. Resilience is only addressed the way that simple message is conveyed through the media. There is limited focus on vulnerable groups in society.

Conclusions:

It would help if the local authorities would make decisions in adaptation of their spatial planning to include the perception of the population and to focus on some vulnerable groups in society. The extension of caring about vulnerable groups beyond the period of heat waves is needed.

Environmental Challenges as Mental Health risks and oppotunities in the light of SDGs

Marija Jevtic

M Jevtic[1,2], *C Bouland*[2]
[1]Faculty of Medicine, University of Novi Sad, Novi Sad, Serbia
[2]Research Centre on Environmental and Occupational Health, Université Libre de Bruxelles, Brussels, Belgium
Contact: marija.jevtic@uns.ac.rs

Background:

Environmental risk factors such as air pollution, contaminated water, climate change, soil pollution, chemical exposures, ultraviolet radiation, noise pollution and others potentially contribute to diseases and mental disorders, such as depressive and anxiety disorders. Taken together mental, behavioral and neurological disorders accounted for 10% of the global disease burden in 2015 and is expected to increase to 15% by the year 2020.

Methods:

We will identify health promoting factors on the background of the changing disorders spectrum. Based on a narrative review we identified as potentially environmental mental health promoting factors quality green areas, e urban planning, sanitation and public transportation, and decrease in noise pollution.

Results:

Using the sustainable development goals (SDGs) as a benchmarking tool in national, regional and local development plans, citizens are empowered to improve their mental health through improved environment. Discussion: Mental health is an underresearched area in the field of environmental health. Intersectoral and interdsiciplinary collaboration can contribute to overcome boudnaries of specific disciplines and build bridges to support the overall goal of promoting and supporting mnetal health and reducing the burden of mental and neurological disorders.

Environment and mental health – developing a research agenda

Jutta Lindert

J Lindert[1,2]
[1]Public Mental Health, University of Emden/Leer, Emden, Germany
[2]Women's Studies Research Center, Brandeis University, Waltham, USA
Contact: mail@jlindert.de

Background:

Environmental research and research on mental and neurological disorders remains largely separated. Research methods in both fields are different using diverse approaches. Aim of this talk is to highlight differences and commonalities in research methods in the fields of environmental and neuropsychiatric epidemiology.

Methods:

A scoping review of methods was preformed using databases such as PUBMED, ISI Web of Science, Embase, CINHAL and PSYCHINFO.

Results:

The search yielded several hundred citations. The search will be updated in July 2019 to provide the most recent results in the workshop. So far the review suggests that the fields of environmental epidemiology and neuropsychiatric epidemiology still are separated. Discussion: Approaches to build a joint research agenda will be discussed. Some methods which are used in both subdisciplines of epidemiology will be described in detail in the workshop. Likewise, challenges in collaboration will be discussed with the audience. This discussion with workshop participants is a possibility to learn from each other and build interdisciplinary bridges.

1.P. Understanding the evidence and novel approaches to health

''Brave men'' and ''emotional women'': A literature review on gendered norms towards patients with pain

Anke Samulowitz

A Samulowitz[1], *I Gremyr*[2], *E Eriksson*[2], *G Hensing*[1]
[1]Social Medicine and Epidemiology, Institut of Medicine, Göteborg, Sweden
[2]Service Management and Logistics, Centre for Healthcare Improvment, Göteborg, Sweden
Contact: anke.samulowitz@gu.se

Background:

More women than men report chronic pain but despite the large body of research on sex differences there is a lack of knowledge on the influence of social and cultural gender. As gender norms can lead to gender bias in health care it is important to raise awareness about them. The purpose of this study was to illustrate gendered norms about men and women with chronic pain in scientific journals, and to analyze how societal norms are reproduced in health care.

Methods:

A literature search of the databases PsycINFO, CINAHL and PubMed was conducted, January 2000 to April 2015, with the search term chronic pain combined with femininity, masculinity, gender bias, gender stereotypes and gender roles. A total of 77 articles met the inclusion criteria and were analyzed qualitatively. The integrative approach enabled a review of articles from both social and medical sciences, and to include qualitative and quantitative research. The material was sorted into theoretical categories and further coded into substantive categories.

Results:

The included articles showed a variety of gendered norms about men's and women's experience and expression of pain, their identity, lifestyle and coping style. Women were described as emotional and hysterical, constantly dealing with mistrust from health care. Men were pictured as brave, stoic and struggling with their sense of masculinity. Prevailing societal norms are consolidated in health care, positioning the masculine man as the ideal patient.

Conclusions:

Gender stereotypes are reproduced in healthcare, which can lead to gender bias in the treatment of patients with pain. The findings were used to develop a tool, ''the pain cube'', aimed to improve health care providers' consciousness about gendered norms.

Key messages:

- Men and women with chronic pain are depicted in a stereotypical way in scientific articles.
- Increased awareness about gendered norms can support health care professionals in providing equitable care.

The association between screen time and psychological distress in Norwegian adolescents

Annette Løvheim Kleppang

AL Kleppang[1], *AM Steigen*[2], *HS Finbråten*[2]
[1]Public Health and Sport Sciences, Innland Norway University of Applied Sceinces, Elverum, Norway
[2]Helath and Nursing Sciences, Innland Norway University of Applied Sciences, Elverum, Norway
Contact: annette.kleppang@inn.no

Background:

The use of screens, especially mobile devices like tablets and smartphones have increased over the last years, and have become an integrated part of modern life. Adolescents today spend a lot of their time using screens both at school and outside school. The concerns about the impact of screens on adolescents are growing, and some expert groups have suggested controlling screen time for children and young adults. Because research is limited and screen-based utilization technologies and their patterns are changing rapidly, it is important to examine their impacts on mental health. This can help to guide public health policy on consequences of, and potential limits on screen time. The purpose of this study is to study the association between screen time and psychological distress among adolescents.

Methods:

This study is based on self-reported cross-sectional data from the Ungdata survey conducted in 2018. The target group comprised 6777 adolescents from secondary schools in Norway. Ten items on depression and anxiety symptoms were used to create a composite measure of psychological distress. Binomial logistic regression was used to analyse the association between screen time and psychological distress.

Results:

Preliminary results showed that the odds for psychological distress were higher for those who used screens more than 2 hours per day after school (OR: 1.83, 95% CI: 1.60-2.09), compared to those who used screens 2 hours and less per day. Further, the odds of having psychological distress were higher in girls compared to boys (OR: 3.49, 95% CI: 3.14-3.87), and in upper secondary school compared to lower secondary school (OR: 1.41, 95% CI: 1.25-1.58).

Conclusions:

Two hours or more used on screens per day was associated with significantly higher odds for psychological distress. Hence, public health policy and practice should pay attention to consequences of screen time use in adolescence. Additional research is needed to further explore these associations.

Key messages:

- Public health policy and practice should pay attention to screen time in adolescence and its association with psychological distress.
- This knowledge is important to enhance mental health in adolescence.

Sense of belonging and its association with health among people of foreign background in Finland

Anna Seppänen

A Seppänen[1], E Lilja[1], S Rask[1], H Kuusio[1]
[1]Equality and Inclusion Unit, Department of Welfare, Finnish National Institute for Health and Welfare, Helsinki, Finland
Contact: anna.p.seppanen@thl.fi

Background:

Sense of belonging is recognized as an important determinant of health. There is little research on the association between sense of belonging and health of people of foreign background (PFB) in Finland. In this study we examined: 1) to which extent PFB feel they belong to the Finnish society and citizens of their country of origin (CCO) and 2) if sense of belonging is associated with self-perceived health.

Methods:

Data from a cross-sectional survey FinMONIK conducted in Finland 2018 was used. The random sample consisted of PFB (N = 12 877, response rate 53%). Identity was assessed by using the question ‘‘Which of the following areas or groups you feel you belong to?’’ with response options ‘‘My local municipality’’, ‘‘Finns’’, ‘‘the citizens of my country of birth or origin’’. Based on this, we constructed a variable to group respondents belonging 1) only to the Finnish society, 2) only to CCO and 3) to both Finnish society and CCO (bicultural identity). Self-perceived health was measured by using a 5-point-scale and merging good and fairly good as a good perceived health factor. Logistic regression was used to test the association between perceived health and sense of belonging, adjusted for age, sex and country of origin.

Results:

Majority of the respondents (39%) reported a bicultural identity, whereas 21% felt they belonged only to the Finnish society and 23% only to CCO. Self-perceived health was significantly associated with sense of belonging ($p < 0.001$). Good perceived health was more common among those with bicultural identity (73%) than among those who felt belonging only to the Finnish society (66%) and CCO (63%).

Conclusions:

Bicultural identity was most common and also associated with better perceived health.

Key messages:

- Sense of belonging to both host country citizens and CCO is likely to benefit individual’s health.
- Identifying with host country citizens and maintaining sense of self as a member of CCO should be supported.

G-CSF spending: Cost Impact of an intervention conducted in a French area: Pays-de-la-Loire

Basile Fuchs

AC Chaslerie[1], BF Fuchs[1], FR Grude[4], HB Bourgeois[3], CV Vigneau Victorri[2], NG Garrec[1]
[1]DRSM Pays de la Loire, French National Health Insurance CNAM, Nantes, France
[2]Pharmacology, University Hospital, Nantes, France
[3]Oncology, Victor Hugo Private Hospital, Le Mans, France
[4]Pharmacy, Cancer Dedicated Observatory, Angers, France
Contact: fuchs.basile@gmail.com

Issue:

Granulocyte colony-stimulating factors (G-CSF), recommended by international oncology guidelines as a prophylaxis of febrile neutropenia are expensive drugs. Despite biosimilars marketing since 2008, G-CSF spending represents a major and growing expense for health insurance.

Description of the problem:

Between 2010 and 2013 an unsustainable increase of G-CSF spending by 20% occurred in a French area: Pays-la-Loire. An intervention based on guidelines was carried out to the oncologists involved in ambulatory cancer care to reduce G-CSF spending by improving prescription and promoting biosimilars. Hospital oncologists have been the main target. A partnership between physicians and pharmacists of the Brittany - Pays-de-la-Loire Cancer Dedicated Observatory network and the Pays de la Loire Medical Department of Health insurance composed the operational team involved in the work. Interrupted time series analysis based on the French national health data system database were chosen to assess the impact of the intervention on G-CSF spending, their prescription and biosimilars use.

Results:

Twelve professional meetings were performed to cancer medical teams from 7 community hospitals and 5 private hospitals of the Pays-de-la-Loire region. This intervention reduced G-CSF spending by 11% and improves G-CSF local use.

Lessons:

This type of multi-stakeholder intervention carrying common to various health actor’s messages represents a promising tool to improve the quality of care and the control of health expenditure. These results and the possible cost saving showed have encouraged the heads of French health insurance to promote this action in 2019 in the whole France.

Key messages:

- In the current context of unsustainable increases in cancer cares related costs in France the rational use of G-CSF’s seemed to be one available resources.
- biosimilar promotion for ensure broad access to innovative cancer therapeutic for patients and finance cancer prevention campaigns.

1.Q. Paid work, sickness absence and workforce management

Emotional demands at work and risk of long-term sickness absence among 1.5 million Danish employees

Elisabeth Framke

E Framke[1], *JK Sørensen*[1], *IEH Madsen*[1], *R Rugulies*[1,2,3]
[1]National Research Centre for the Working Environment, Psychosocial Factors at Work, Copenhagen, Denmark
[2]Institute of Public Health, University of Copenhagen, Copenhagen, Denmark
[3]Institute of Psychology, University of Copenhagen, Copenhagen, Denmark
Contact: elf@nrcwe.dk

Background:

Emotional demands concern aspects of work requiring an emotional effort of employees and have been associated with risk of depression and long-term sickness absence (LTSA) in previous studies. Associations may, however, partly be affected by reporting bias. Further, previous studies have primarily been conducted using smaller samples in selected job groups or sectors. We, therefore, examined the association between emotional demands and LTSA using a job exposure matrix (JEM) in a nationwide cohort.

Methods:

We included all employed individuals in Denmark who were 30 to 59 years old in 2000. We assessed emotional demands at work with a JEM. JEM values were categorized into quartiles based on the distribution within each year and updated annually from 2000 to 2009. LTSA was register-based, defined as ≥ 6 weeks and assessed until 2015. Individuals with LTSA from 1998 to 2000 were excluded, yielding a sample of 1,521,352 individuals. Exposure in year t was related to outcome in year $t+1$ until 2009. We estimated hazard ratios (HR) and 95% confidence intervals (95%CI) using Cox regression adjusted for age, sex, income and ergonomic job demands.

Results:

During 15,453,980 person-years, we identified 594,858 LTSA cases. In the fully adjusted model, individuals in the highest emotional demands quartile had a HR of 1.30 (95%CI: 1.29-1.31) compared to individuals the lowest quartile Repeating the analysis separately for women and men showed similar results.

Conclusions:

Emotional demands at work were prospectively associated with an increased LTSA risk in this JEM based nationwide cohort study.

Key messages:

- This study found that emotional demands at work predict risk of long-term sickness absence.
- Future studies should focus on factors that may buffer the association between emotional demands at work and long-term sickness absence.

Labor market outcomes before and after first episode of part-time sickness absence

Jenni Ervasti

J Ervasti[1], *J Kausto*[1], *A Koskinen*[1], *J Pentti*[5], *J Vahtera*[2,3,4], *M Joensuu*[1], *J Turunen*[1], *T Oksanen*[1], *M Kivimäki*[5,6,1]
[1]Finnish Institute of Occupational Health, Helsinki, Finland
[2]Department of Public Health, University of Turku, Turku, Finland
[3]Population Research Centre, University of Turku, Turku, Finland
[4]Turku University Hospital, Turku, Finland
[5]Clinicum, University of Helsinki, Helsinki, Finland
[6]Department of Epidemiology and Public Health, University College London, London, Finland
Contact: jenni.ervasti@ttl.fi

Background:

Previous research suggests that part-time sickness absence (PTSA) results in better work participation compared to full-time sickness absence (FTSA), but few studies have examined trends in FTSA and unemployment before and after PTSA.

Methods:

This Finnish population-based cohort study included 3406 individuals with first episode (>30 days) of PTSA in 2011 (= PTSA group), 42 510 individuals with FTSA (>30 days) in 2011 (= FTSA group), and 25 167 individuals with no sickness absence (>30 days) in 2011 from the general working-age population. Annual days of FTSA from 2007 to 2015 and unemployment from 2012 to 2015 were measured for the participants of each group. We modeled trends and relative risks for these labor market outcomes using negative binomial regression with generalized estimation equations.

Results:

For the PTSA group, the adjusted mean annual number of FTSA days was 3 in the beginning of the follow-up, 15 a year before the index year, and 8-10 after the index year. The adjusted risk ratio (RR) of FTSA days after versus before PTSA was 1.95 (95% CI 1.75-2.17). For the FTSA group, mean of sickness absence days was 4 in the beginning, 13 a year before the index year and 9-19 after the index year. The mean of FTSA was 1-2 throughout the follow-up in the general population. An increasing slope in unemployment after the index year was observed in all groups, the absolute level of unemployment being highest among FTSA group and lowest among the general population group.

Conclusions:

Long-term PTSA marks a decline in labour market participation. In absolute terms this decline is smaller than that in employees with long-term FTSA.

Key messages:

- Part-time sickness absence lasting >30 days marked an increase in full-time sickness absence although the absence levels did not reach those observed after full-time sickness absence of > 30 days.
- Our results show smaller impairment in labour market outcomes in employees granted a long-term part-time sickness absence than in those with long-term full-time sickness absence.

Work-pressure, job-satisfaction and turnover intentions among health managers in Serbia

Milena Šantrić Milićević

M Šantrić Milićević[1], *M Gačević*[2], *N Milić*[1], *J Filipović*[3], *J Todorovic*[1], *Z Terzic-Supic*[1]
[1]Faculty of Medicine, Belgrade, Serbia
[2]Medical school ''Dr Andra Jovanović'', Šabac, Serbia
[3]Faculty of Organisational Sciences, Belgrade, Serbia
Contact: milena.santric-milicevic@med.bg.ac.rs

Background:

Rationalization, freezing of salaries and additional taxation of salaries above a certain amount have marked the reform of the public health sector in Serbia in 2014/15. Health managers bear responsibility for success in reform activities, and improvement of subordinates' job satisfaction and health care quality with constrained resources. This study explored factors associated with work-pressure, turnover intentions and job satisfaction among health managers in 323 public health institutions in Serbia.

Methods:

Data of the 2015 job satisfaction survey of the Ministry of Health and the Serbian Public Health Institute were used to carry out a secondary analysis. Logistic regression was applied, including factors such as age, gender, occupation (doctors, nurses, other health workers, healthcare associates and non-medical managers), workplace, work-conditions' satisfaction, general job satisfaction, and turnover intention in relation to work-pressure of 7818 health managers (response rate was 91.5%).

Results:

Almost 39.5% of the health managers experienced high/very high work-pressure ($p < 0.001$), 51.2% were dissatisfied ($p < 0.001$), and 23.7% had turnover intention outside the health sector/country ($p < 0.001$). High/very high work-pressure positively correlated with health managers of secondary (Odds Ratio-OR $= 1.37$, $p < 0.001$) and tertiary care institution (OR = 1.72, $p < 0.001$), female sex (OR = 1.19, p = 0.004), younger than 55 years of age (OR = 1.26, $p < 0.001$), and nurses (OR = 1.13, p = 0.024). Other factors showing positive correlations include job dissatisfaction in general ($p < 0.001$) and with all workplace conditions ($p < 0.001$), as well as turnover intentions ($p < 0.001$).

Conclusions:

Work pressure of health managers seems to be perceived highest in the group of younger female nurse executives in hospital care. Their dissatisfaction with the job in general and with the working conditions, as well as turnover intentions positively correlate with the increase of work pressure.

Key messages:

- Improving working conditions and job satisfaction is key to reduce work pressure of health managers.
- Young female nurse managers perceive highest levels of work pressure, and need reinforcement at work.

A life course analysis of income and incident AMI - a Danish register based cohort study

Rikke Lund

R Lund[1,2], M Kriegbaum[1], I Andersen[1], CO Hougaard[1], H Brønnum-Hansen[1]
[1]Section of Social Medicine, Department of Public Health, University of Copenhagen, Copenhagen, Denmark
[2]Center for Healthy Aging, University of Copenhagen, Copenhagen, Denmark
Contact: rilu@sund.ku.dk

Background:

Social inequality in ischemic heart disease has been related to socioeconomic position in childhood, early and late adulthood. However, the impact of relative level of accumulated income periods across adult life course and the potential gender and age differences has not been investigated.

The aim was to investigate the association between relative level of accumulated income across the life course and Acute myocardial infarction (AMI) from age 60+ and to study if the associations differ by gender and exposure in different age groups (30-39 years, 40-49 years and 50-59 years).

Methods:

All Danes born 1935-54 N = 1,235,139 were followed-up in registers for incident AMI (ICD8: 410, ICD10: I20, I21) from age 60+, (42,669 cases). The The Accumulated Proportional Deviation from Median Equivalized Income = APDMEI for each gender/age /calendar year strata was constructed and divided in quartiles. The analyses stratified by birth cohort included all Danes born in 1955-70 (alive and reached age 40) N = 1,144,264, 1945-64 (alive and reached age 50), N = 1,434,769, 1935-1954 (alive and reached age 60) N = 1,235,139 including outcomes in the following 10 year period. Cox's proportional hazard models adjusted for educational level, ethnic background and birth cohort.

Results:

Among men, those in the lowest APDMEI quartile had a HR 1.40 (1.35-1.45) of AMI compared to the highest quartile, second and third highest quartiles had HR of 1.24 (1.20-1.28) and 1.14 (1.10-1.18), respectively. Among women the lowest quartile had a HR of 1.78 (1.69-1.88), the second 1.45 (1.37-1.53) and the third 1.19 (1.13-1.26). The social gradient was similar across the different age-groups.

Conclusions:

The risk of AMI increased with lower levels of relative accumulated income across the life course. While men generally had a higher risk of AMI, the social gradient was steeper in women. There was no indication of a specific sensitive age period for exposure to relative level of accumulated income.

Key messages:

- Accumulated low income is associated with higher AMI risk in both men and women, but with larger relative differences between high and low accumulated income in women.
- This study adds a new approach to the study of inequalities in AMI by integrating duration and extent of low income into a relative measure of accumulated income.

Vaccination role on abseteeism during a severe flu season: following the Global Influenza Strategy

Omar Kakaa

O Kakaa[1], MM Gianino[1], C Zotti[1]
[1]Department of Public Health Sciences, University of Turin, Torino, Italy
Contact: okakaa@unito.it

Background:

In March 2019, the WHO published the ''The Global Influenza Strategy for 2019-2030'', with the goal of strengthening seasonal prevention and control and preparedness for future pandemics. Accordingly, to the 2B, 2C, 3B goals, this study tries to assess the burden of the disease among the healthcare workers (HCWs). Our study aimed to estimate the impact of severe intensity season on absenteeism among HCWs in a large Italian hospital and if the vaccination rates would be associated with reduced sickness absence.

Methods:

We investigated excess of absenteeism that occurred in a large Italian hospital, counting 5300 HCWs, during the flu season of 2017-2018. Data on influenza vaccination were gathered from the Occupational Health Unit, while absenteeism data from the hospital's Personal Unit Database. The data collection ranged from July 2017 to June 2018, it was divided into two periods: epidemic and non-epidemic, the last one used as a baseline to calculate excess of absenteeism. We also gathered other variables in order to stratify the absenteeism among HCWs.

Results:

The total lost days were 53.775. The average number of lost days per week during the epidemic period was 1263. Compared to the non-epidemic period, absenteeism increased by 65% (from 4.05 to 6.68 days/person). Vaccinated HCWs had a lower excess of absenteeism in comparison to non-vaccinated HCWs (1,74 vs 2,71 days/person). Nurses and allied health professionals registered the highest excess of absenteeism (3.16 days/person) while medical doctors showed the lowest (0.76 days/person).

Conclusions:

A severe influenza epidemic impacts on the excess of absenteeism among HCWs. Although the low vaccination rate (6,8%), a positive effect on absenteeism is outlined and it may support health care facilities to promote and facilitate flu vaccination among HCWs. As literature states low absenteeism rate, as seen in medical doctors, could be an indicator of presenteeism that might lead to harm the inpatients.

Key messages:

- The flu vaccination has a positive effect on reducing the absenteeism rate in the HCWs during the epidemic period and should be promoted and advocated among european healthcare facilities.
- A low absenteeism rate may also be an indicator of presenteeism among HCWs, which may also be harmful to the inpatients.

2.A. Determinants of health equity

Household Income, Life Expectancy and Cause Specific Mortality in Norway, 2005-2015

Simon Øverland

S Øverland[1], *J Kinge*[1], *AK Knudsen*[1]
[1]Norwegian Institute of Public Health, Bergen, Norway
Contact: simon.overland@fhi.no

Background:

Examining causes of death and making comparisons across countries may increase understanding of the income-related differences in life expectancy. We describe income-related differences in life expectancy and causes of death in Norway and compare with US estimates.

Methods:

A registry-based study including all Norwegian residents above age 40 between 2005 and 2015. Exposure was household income adjusted for household size and outcomes were life expectancy at age 40 and cause specific mortality.

Results:

3 041 828 persons contributed 25 805 277 person years and 441 768 deaths in the study period (mean age: 59.3 (SD, 13.6). Life expectancy was highest for women with the top 1% income at 86.4 (95% CI, 85.7 to 87.1) years, 8.4 (95% CI, 7.2 to 9.6) years longer than women in the lowest 1% income. Men with the lowest 1% income had the lowest life expectancy at 70.6 years (95% CI, 69.6 to 71.6), 13.8 years (95% CI, 12.3 to 15.2) less than men with the top 1% income. From 2005 - 2015, the differences in life expectancy by income increased, largely attributable to deaths from cardiovascular disease, cancers, COPD and dementia in older age groups and substance use deaths and suicides in the younger. Over the same period, women in the top income quartile gained 3.2 years (95% CI, 2.7 to 3.7), while life expectancy for women in the lowest income quartile was reduced by 0.4 years (95% CI, -1.0 to 0.2). For men, the top quartile gained 3.1 years (95% CI, 2.5 to 3.7) and the bottom gained 0.9 years (95% CI, 0.2 to 1.6). Differences in life expectancy by income levels in Norway were similar to those observed in the United States, but life expectancy was higher in Norway in the lower to middle part of the income distribution.

Conclusions:

In Norway, there were substantial and increasing gaps in life expectancy by income from 2005 - 2015. The largest differences in life expectancy between Norway and US were for people in the lower to middle part of the income distribution.

Key messages:

- In Norway, a country with a largely tax financed universal health care system and moderate income differences, life expectancy by income are substantial and have increased between 2005 and 2015.
- The largest differences in life expectancy between Norway and US were for people in the lower to middle part of the income distribution.

Economic hardship over twenty-two consecutive years of adult life and markers of early ageing

Else Foverskov

E Foverskov[1], *GL Petersen*[1], *JLM Pedersen*[2], *NH Rod*[1], *EL Mortensen*[1], *H Bruunsgaard*[3], *R Lund*[1]
[1]Department of Public Health, University of Copenhagen, Copenhagen, Denmark
[2]National Food Institute, Technical University of Denmark, Kgs. Lyngby, Denmark
[3]Department of Clinical Immunology, University Hospital of Copenhagen, Copenhagen, Denmark
Contact: elfo@sund.ku.dk

Background:

The authors examined the associations between annual measures of economic hardship (EH) across 22 years of adulthood and objective measures of early ageing in a Danish late-middle aged population.

Methods:

A linkage of longitudinal register data from Statistics Denmark covering the period 1987-2008 and cross-sectional survey data from the Copenhagen Ageing and Midlife Biobank collected in 2009-11 (N = 5,575). EH was defined as < 60% of the National median equivalized household disposable income and two exposures were calculated: 1) a categorical measure of total number if years in EH, and 2) trajectories of the probability of EH being low, declining, rising or high. Early ageing outcomes included four measures of physical capability, three inflammatory markers and one cognitive test. Associations were analyzed using linear regression models adjusted for sex, age, cohort, education, baseline income and long-term parental unemployment/financial problems.

Results:

Four or more years in EH (reference = null years in EH) was related to poorer physical capability (chair rise: -1.49 counts/30 seconds [95% confidence interval (CI) -2.36, -0.61], hand grip strength: -1.22 kg [95% CI -2.38, -0.07], jump height: -1.67 cm [95% CI -2.44, -0.91] and balance: 18% [95% CI 9, 28]), poorer cognitive function (Intelligenz-Struktur-Test: -1.50 points [95% CI -2.89, -0.12]) and higher inflammatory levels (C-reactive protein: 22% [95% CI 4, 44], and Interleukin-6: 23% [95% CI 10, 39]). Comparing the four EH trajectories, people with a high vs. low probability of EH over time had poorer physical capability (chair rise: -1.70 counts/30 seconds [95% CI -3.38, -0.01], grip: -4.33 kg [95% CI -6.50, -2.16], jump: -1.68 cm [95% CI -3.12, -0.25], and balance: 31% [95% CI 12, 52]). No associations were observed with Tumor necrosis factor α.

Conclusions:

This study suggests that sustained EH across adulthood may lead to early ageing.

Key messages:

- Sustained economic hardship in adulthood may lead to early ageing.
- Being in economic hardship for a few years is not associated with early ageing.

Long-term effects of a housing support intervention in homeless people with severe mental illness

Sandrine Loubiere

C Lemoine[1], *S Loubiere*[1,3], *A Tinland*[2,3], *M Boucekine*[1], *V Girard*[3], *P Auquier*[1,3]
[1]Service Épidemiologie and Économie de la Santé, DRCI, APHM, Marseille, France
[2]MARSS, APHM, Marseille, France
[3]CEReSS, AMU, Marseille, France
Contact: sandrine.loubiere@univ-amu.fr

Objectives:

Recent studies have suggested that the Housing First model is a promising strategy for providing effective services to homeless people with mental illness at a short-term horizon. The paper assesses the long-term effects of an independent housing with a recovery-oriented approach in homeless people with severe mental illness on social recovery, mental symptoms and quality of life among homeless adults with high support needs for mental and physical health services.

Design and methods:

“Un Chez Soi d’Abord” was a randomized controlled trial conducted in 4 French cities: Lille, Marseille, Paris and

Toulouse. From August 2011 to April 2014, homeless participants with a DSM-IV-TR diagnosis of bipolar disorder or schizophrenia (N = 703) were randomly assigned to Housing First (n = 353) or Treatment as Usual (n = 350). Mental symptoms (MCSI), social recovery (RAS), global physical and mental status (SF-36), subjective quality of life (S-QoL) and addictions (MINI) were collected every 6 months over 48 months. Mixed models using a longitudinal and cluster design were performed, and adjusted to age on the street, gender and mental disorder diagnosis and testing for time-group and site*time interactions.

Results:

HF patients exhibited higher recovery ($\beta = 3.6$, 95%CI: 0.4 to 6.9), higher S-QoL (4.7, 1.1 to 8.3) such as the self-esteem (10.9, 5.8 to 15.6) and physical well-being (8.4, 3.1 to 13.8) sub-dimensions, and improved mental health symptoms (-3.1, -5.4 to -0.9) over the 4-year follow-up. No significant differences were observed for SF36 scores. HF and TAU participants experienced similar alcohol or substance dependence evolution between baseline and 48 months.

Conclusions:

HF is a highly effective intervention associated with improved relational environment, enhancing recovery and quality of life in homeless people with schizophrenia or bipolar disorders. Addiction issues have been identified and should be targeted so as to further improve the Housing First approach.

Key messages:

- Housing First model is a highly effective intervention.
- Housing First model enhances recovery and quality of life in homeless people.

Europeans' willingness to pay for ending homelessness: a contingent valuation study

Sandrine Loubiere

S Loubiere[1], A Tinland[2], O Taylor[3], A Loundou[1], P Auquier[3], J Ornelas[4]
[1]DRCI, APHM, Marseille, France
[2]MARSS, APHM, Marseille, France
[3]CEReSS, AMU, Marseille, France
[4]APPSYCI, ISPA, Lisbon, Portugal
Contact: sandrine.loubiere@univ-amu.fr

Objective:

In Europe, 4 million people were homeless in 2009. The Staircase model of care targeted mental health, drug rehabilitation and housing readiness yields poor long-term housing results. Western countries are investing in a new model, Housing First (HF), which yields better clinical and social results. We aim to explore how much the European citizens are willing to pay for the HF model and what are the determinants of this valuation.

Methods:

A nationally representative telephone survey conducted in 2017, targeted European adult citizens from France, Ireland, Italy, Netherlands, Portugal, Spain, Poland and Sweden. Respondent's willingness-to-pay (WTP) (n = 5,631) for HF model was assessed through a contingent valuation method with bidding algorithm. Multivariate analyses using two-part models with a cluster and weighted design were conducted to predict: 1/ respondents' refusal or incapacity to pay for the HF model; 2/ willingness-to-pay (continuum) for the HF model.

Results:

42.3% of respondents were willing to pay more taxes to reduce homelessness through HF model; 30.3% were protest zero (don't want to pay taxes (either contested the payment vehicle-taxes- or the survey instrument); huge differences being observed between countries (P<.001). Respondents were willing to pay €57 (+/- 9) through annual taxes for the HF model. Respondents with higher educational attainment, paying taxes on income, reporting positive attitudes about homelessness or practices to reduce homelessness (donations, volunteering), and those residing in a country with higher share of social protection expenditures on family benefits or higher at-risk-of-poverty rate were more likely to value the HF model.

Perspective:

These results provide key stakeholders with an understanding of the level of support from the general population for the Housing First model; especially since the determinants of this valuation were studied according to the social and environmental context of each country.

Key messages:

- More than 42% of European citizens reported to be willing to pay for reversing homelessness.
- More than a three quarter of European citizens thought that Government spending on Homelessness is too little.

Do financial difficulties affect health? A study among older adults in Switzerland

Magali Dumontet

M Dumontet[1], B Santos-Eggimann[2]
[1]EconomiX-UMR7235, Paris Nanterre University, Nanterre, France
[2]Unisanté, Lausanne, Switzerland
Contact: magali.dumontet@parisnanterre.fr

Background:

In perspective of health promotion strategies among older adults, it is particularly important to identify socioeconomic determinants associated with the dynamic of health. In this study, we want to assess the role of financial difficulties on health among older adults.

Methods:

We use cohort data coming from the Lausanne cohort 65+. Participants were community-dwelling older adults representative of the general population aged 65 to 70 years in 2004 and living in Lausanne (Switzerland). This cohort is a longitudinal survey and was designed as an annual survey where same individuals (N = 1564) are re-interviewed in successive waves. Wave 1 and wave 2 are considered as baselines. We perform our analysis on the 2006-2016 period (11 waves). We consider the health dynamic by estimating system GMM estimators. Our main explanatory variable is a proxy of financial difficulties: "Have you been confronted to financial difficulties in the last 12 months?". We study the effect of this variable on several health indicators (self-rated health, number of medical conditions, depression, difficulties in activities in daily living) and evaluate if this effect is similar for these different dimensions of health.

Results:

Our econometric analysis underlines the importance of using dynamic approach: health lag variables have significant effects ($p < 0.01$) and to control for endogeneity bias. We find no evidence of a causal link from having financial difficulties to health. The effect was non-significant for all health variables.

Conclusions:

In terms of public policy, our results provide insight that policies allowing to limit short term financial difficulties are not essential to protect elderly against health deterioration.

Key messages:

- There is no evidence of a causal link from having financial difficulties to health.
- Policies allowing to limit short term financial difficulties are not essential to protect older adults against health deterioration.

//blrnas3/cenpro/ApplicationFiles/Journals/OUP/EURP/Vol00000/190193/Comp/APPFile/OP-EURP190193.3d [25.10.2019–6:48pm] [6–298] Paper: OP-EURP190193

2.B. Workshop: Developing interventions to improve migrants' healthcare access in Europe

Organised by: MyHealth Project
Chair persons: Núria Serre-Delcor - Spain, Stella Evangelidou - Spain
Contact: narinekm@gmail.com

The proposed workshop "Developing interventions to improve migrants' healthcare access in Europe" will present interim results from the cross-disciplinary MyHealth project to discuss them and the early lessons with policymakers, academics, funders and practitioners in the area of migration and health.

MyHealth (Models to engage migrants and refugees in their health, through community empowerment and learning alliance) is a three-year project coordinated by Fundació Hospital de la Vall d'Hebrón, Institut de Recerca (VHIR), Barcelona, Spain and implemented by a consortium of eleven partners with the CHAFEA support in the framework of the 3rd EU Health Program. The goal of the MyHealth project is to improve the healthcare access of vulnerable migrants and refugees (VMR) newly arrived to Europe, by developing and implementing models based on the knowhow of a European multidisciplinary network. This project strongly relies on a participatory approach to ensure a beneficiary-centred approach in implementing a number of interconnected objectives. To ensure a meaningful involvement of the community we applied the Metaplan technique to identify health concerns and needs perceived by vulnerable immigrants and also by professionals from diverse backgrounds working with them at the four partnering sites (Barcelona, Berlin, Brno and Athens). The Metaplan© is a qualitative technique that involves first collecting ideas or information on cards, grouping the cards according to shared characteristics, and ultimately, using a voting system to rank individual ideas or groups of ideas. The research team used this methodology to validate the health needs of immigrants identified by the MyHealth needs assessment methodology and prioritize them, and to generate, categorize and prioritize suggested solutions. These results will be analysed to identify community health strategies and to implement pilot interventions most relevant for the cultural and social reality at each of the sites. Further, the effectiveness of these interventions as a dissemination model will be evaluated. As an innovative approach, the project uses a Learning Alliance methodology to engage multiple stakeholders in the research process through a series of interconnected networks. Each of the he partners aim to document and reflect on best practices for the improvement of the migrants' access to healthcare and thus provides an opportunity for mutual learning for the consortium members and their respective networks. The workshop will feature presentations by MyHealth partners that will be followed by the moderated Q&A session with the panel of presenters. The workshop participants feedback will be additionally sought through a self-administered workshop evaluation questionnaire. The workshop will facilitate the information exchange and discussion between the MyHealth consortium partners and other ongoing initiatives to improve migrants' healthcare in European countries.

Key messages:

- The community engagement in the development of interventions to facilitate the access to health services while ensuring quality care to migrants community is pivotal in health promotion initiatives.
- In spite of the notable variability across the sites, the ubiquitous barriers were associated with both host and migrant communities, for which the future interventions would need to account.

Community engagement towards the development of health promotion tools: Summary findings of Metaplan sessions in Barcelona

Stella Evangelidou

S Evangelidou[1]
[1]Institut de Recerca (VHIR), Vall d'Hebrón University Hospital, Barcelona, Spain
Contact: stella.evangelidou@vhir.org

Background:

Spain has been a popular destination for immigrants mainly because of its cultural proximity with Latin America and its geographical proximity with Africa. More than 70% of migrants in the Spanish autonomous region of Catalonia reside in its capital city, Barcelona. The community engagement in the development of tools, which facilitate access to health services while ensuring quality healthcare provision to Vulnerable Migrants and Refugees (VMRs), is pivotal in health promotion initiatives.

Methods:

The participation of the target population in the decision-making process over strategies to increase healthcare access was assured by employing the Metaplan© methodology. Five Metaplan group sessions were conducted in Barcelona with VMR: One with professionals (N = 13), two with young adults (N = 4, N = 6), one with women (N = 6) and one with Latin Americans (N = 9). All sessions were conducted at the Community Medicine Unit of Vall d'Hebron University Hospital.

Results:

Two main categories of solutions were found through a thematic analysis. Primarily, the solutions associated to initiatives that the host community needs to undertake included: promotion of socio-economic stability for VMRs, communication campaigns though informative leaflets and orientation sessions on immigrants' rights and available health services, as well as community-based interventions such as empowering the work of community agents/"health champions", establishing mobile clinics and setting-up (peer) support groups. The second category of solutions was related to the personal barriers VMRs may face: improvement/acquisition of language skills and the importance of addressing one's mental health problems.

Conclusions:

Both the host community and the immigrants themselves are co-authors of the design and implementation of efficient health promotion strategies towards healthcare access and improvement of healthcare quality provision for VMRs in the given socio-cultural context of Barcelona city.

In the search of solutions to improve healthcare access for migrants and refugees in Athens, Greece

Maria Ntetsika

N Gionakis[1], *M Ntetsika*[1]
[1]Babel Day Centre, Syn-eirmos NGO of Social Solidarity, Athens, Greece
Contact: m.ntetsika@gmail.com

Background:

Migrants and refugees face many challenges in their effort to access the health services. The Metaplan© methodology was applied to generate and prioritize solutions and tools for pilot interventions to improve migrants' healthcare access in

Athens. Methods. The Metaplan sessions included three groups: professionals working with refugees and migrants, mixed gender French-speaking migrants and refugees, and unaccompanied minors (11-16yrs).

Results:

Professionals prioritized the communication issue, particularly a proper delivery of the language courses, and the enhancement of cultural competence in professionals. Besides, the instrumentalization of 'vulnerability' was focused on the relocation assessment. They suggested trainings to improve the collaboration between interpreters and professionals and build cultural competence, along with creation of migrant-friendly hospitals. The migrants underscored a gap between their needs and the current efforts to support their integration, such as language courses, job consultancy, and general information. Their access to health services was hindered by the lack of language skills and intercultural competences of providers. The migrants prioritized initiatives to overcome the challenges of everyday life, raise awareness and sensitize the local community on their realities, and tackle racism. The unaccompanied minors underlined the lack of shelters and a long bureaucratic procedure for the placement in a shelter as some experienced homelessness. They also pointed out the inefficiency of emergency health services. The solutions as perceived by this group included a proper assignment of homeless minors to shelters, better emergency units and more information about the health services.

Conclusions:

The trainings for both health professionals and interpreters for the interdisciplinary cooperation and enhanced cultural competence are needed, along with informative workshops and flyers on health rights and services.

Informing the development of a pilot intervention to improve migrants' healthcare assess in Brno, Czech Republic

Narine Movsisyan

NK Movsisyan[1], *E Matuchova*[1]
[1]International Clinical Research Center, St. Anne's University Hospital, Brno, Czech Republic
Contact: narinekm@gmail.com

Background:

Third-country nationals have the least access to healthcare in the Czech Republic yet representing the largest group of migrants. This study aimed to inform the development of a pilot intervention to improve migrants' healthcare access in Brno, Czech Republic, within the existing health policy framework.

Methods:

A Metaplan© qualitative technique was applied to ensure the community participation, through separate sessions with social integration professionals and third countries nationals. Each group first identified issues in migrants' healthcare, then suggested solutions to address these issues and prioritized these solutions.

Results:

The professionals' group included five representatives of social integration service providers and administrators. The majority of migrants were female, with higher education, ages 35-55 years, arrived in two years mainly from Ukraine, and not employed.

The social integration professionals were more knowledgeable of healthcare policy and migrants' rights and suggested a wider scope of solutions. The migrants underscored the role of reliable information as a critical tool in utilizing healthcare services. Both groups prioritized an open access to the information as a direct benefit to the users. Other suggestions included multilingual mobile applications, visual aids and translation services, bilingual doctors and universal access to public health insurance. The feasibility of these solutions varied and so their value as intervention models.

Conclusions:

The future interventions should focus on health literacy in the migrant community. This would include the dissemination of multilingual information on health emergency, children vaccinations, health insurance and healthcare system, among other topics, and interactive trainings for migrants and social counselors, to improve self-efficacy in both groups.

Participatory research for developing health promotion campaigns for migrants and host community in Berlin, Germany

Meryam Schouler-Ocak

M Schouler-Ocak[1], *N Kirkgöze*[1]
[1]Psychiatric University Clinic, Charité at St. Hedwig-Krankenhaus, Berlin, Germany
Contact: meryam.schouler-ocak@charite.de

Background:

During the current refugee crisis, hundreds of refugees left their homes and fled to Europe. The country that received the highest rates of refugees was Germany, which above all presented a challenge to the healthcare system. This study aimed to inform the development of a pilot intervention to improve migrants healthcare access in Berlin, Germany.

Methods:

A Metaplan© qualitative technique was applied to ensure the community participation, with three sessions with refugee and asylum seeking women and youth in Arabic, Somali and German languages, and one with professionals. With each group, participants identified issues in migrants' healthcare, then suggested solutions to address these issues and prioritized these solutions.

Results:

The migrants (n = 30) were mainly from Syria (n = 4), Somalia (n = 14) and other African countries, mainly females (17-53 yrs) and youth (16-18yrs). The professionals' group (n = 13) included an interdisciplinary team of a psychiatric day clinic. All groups prioritized language barriers as a crucial problem and suggested to work with interpreters to facilitate the communication. Professionals are additionally confronted with cultural differences in the treatment of refugees. Somali women prioritized raising the awareness about Female Genital Mutilation in the healthcare system and also in their community. Other suggestions included supervisors for unaccompanied minors, multilingual forms, increased intercultural competence of health care providers and reducing waiting time for an appointment.

Conclusions:

Future interventions should focus on intercultural competences for professionals and health-promoting information in the specific sociocultural context of migrant communities. This would include the dissemination of multi-lingual doctors' brochures, interactive training for health care providers as well as informational workshops for migrants to increase their health literacy and promote health-enhancing behaviors.

2.C. Digital health

E-health for healthcare system users & social and geographic health inequalities, literature review

Viviane Ramel

V Ramel[1]
[1]Bordeaux Population Health Center, Inserm U1219, EMOS Team, Bordeaux University, Bordeaux, France
Contact: viviane.ramel@u-bordeaux.fr

Objective:

EHealth has been taking a growing part in public health policies and seems to make it possible to break space and time barriers currently impacting health and well-being (by improving care coordination, prevention, decision support and helping care delivery). However, there is a growing literature on eHealth-related digital divides. We therefore need to understand better the interface between social and geographic vulnerabilities and eHealth services. Previous reviews of the literature started exploring it but lacked a sufficient framework that would be useful for health professionals to adapt to their practice.

Methods:

We carried out a scoping literature review of these relationships in scientific literature since 2000 in Western countries in Scopus, PubMed, PsycArticles, SocIndex, PBSC.

Results:

The links between eHealth oriented towards healthcare system users and social and geographic health inequalities (SGHI) can be observed at three levels: access to digital technologies, understanding of digital technologies and of the information provided (eHealth literacy) and adoption of these technologies to help improve one's health. People's vulnerabilities can become real inequalities regarding eHealth, in a cumulative way. Several types of vulnerabilities are analysed.

Conclusions:

EHealth is more easily accessed by people who need it the least. These unintended consequences have to be taken into account while developing eHealth and more research needs to highlight them. This review contributes insights about eHealth and health inequalities descriptors thus describing better SGHI and of digital technologies fields. It presents a thorough description of this field which has not been sufficiently described in the literature. It is a large scoping review offering a knowledge cartography which purposely addresses the whole spectrum of these links. In the future, it will be interesting to perform further in-depth systematic analyses on specific sub-issues.

Key messages:

- EHealth is more easily accessed by people who need it the least. These unintended consequences have to be taken into account while developing eHealth and more research needs to highlight them.
- This review contributes insights about eHealth & health inequalities descriptors. It offers a knowledge cartography and a strong basis for further in-depth systematic analyses on specific sub-issues.

Could machine learning aid the production of evidence reviews? A retrospective test of RobotAnalyst

Amy Hookway

A Hookway[1], *S Price*[1], *T Knight*[1]
[1]Observatory Evidence Service, Public Health Wales, Cardiff, UK
Contact: amy.hookway2@wales.nhs.uk

Background:

The Observatory Evidence Service (OES) at Public Health Wales supports evidence informed decision making by conducting evidence reviews, which follow systematic review methodology, on complex public health topics. Machine-learning technologies have the potential to aid in screening studies for inclusion in reviews, and the OES have undertaken testing of one such system, RobotAnalyst, to assess its accuracy and to determine if it would increase the efficiency of the review process.

Methods:

Retrospective testing was undertaken using three previously completed evidence reviews. For each test, references were uploaded into RobotAnalyst and the decisions made by the original reviewers were input in blocks of 25 to form a training set. The ''update predictions'' function generated a predicted inclusion decision for the remaining references at each test point and these were compared to the original review decisions.

We calculated RobotAnalysts sensitivity, specificity, positive predictive value, false include and exclude rate and the proportion of missed references.

Results:

Mixed levels of performance were observed. An overall increase in sensitivity as more studies were added to the training set was detected for two of the three reference sets when screened at title stage, but only in one case did RobotAnalyst produce relatively high levels of sensitivity (over 90%). This was observed in reference test set one (n = 500 references), where sensitivity increased from 51% at the start of testing to 91% after 250 references had been manually marked on the system. Although performance tended to be higher as more studies were added to the training sets, the increases were not always linear.

Conclusions:

There may be some promise in using RobotAnalyst as a second screener, especially on larger reference sets when the human resource demands of duplicate screening are considerable. We are continuing to test RobotAnalyst both retrospectively and prospectively.

Key messages:

- Retrospective testing of RobotAnalyst observed mixed levels of performance.
- RobotAnalyst could potentially be utilised as a second screener for evidence review.

MS-Diet, a tailored nutrition counselling web-application based on mathematical diet optimization

Rozenn Gazan

R Gazan[1], *ND Darmon*[2], *FV Vieux*[1], *MM Maillot*[1]
[1]R&D, MS-Nutrition, Marseille, France
[2]MOISA, INRA CIHEAM-IAMM CIRAD, Montpellier, France
Contact: rozenn.gazan@ms-nutrition.com

Background:

By definition, messages in tailored approaches are built to reach a given person, based on her/his specific characteristics and needs. Tailored dietary behavior change interventions have a small but significant effect on dietary behavior change. The majority of these interventions target a few food groups or nutrients, without evaluating the overall diet. Diet optimization is a powerful mathematical method to translate nutrient recommendations into individual-specific food choices. This method is increasingly used in nutrition research, in the fields of public health and diet sustainability. Objective: The aim was to combine tailored approaches and diet optimization in a web application of tailored nutrition counselling.

Method and results:

The web application, called MS-Diet, was developed based on behavior changes techniques, such as: self-monitoring, self-regulatory, tailored feedback and engaging communication techniques. In a first feature, based on user's data collected online (including answers to a food frequency questionnaire), the user can obtain a picture of the nutritional quality of her/his diet, the diet cost and the level of physical activity. In a second feature, MS-Diet suggests to the user a list of tailored dietary advices to get a healthier diet (i.e., a nutritionally adequate diet), adapted to her/his specific needs and food preferences. With the application, the user is actor in her/his own dietary changes: she/he specifies her/his food preferences and; chooses dietary suggestions that she/he considers achievable.

Conclusions:

This prototype could be a future online health promotion tool which could help individuals to improve their diet or serve as a decision-support tool for health professionals. The evaluation of the tool (e.g. whether the use of the tool results in changes of dietary habits) is warranted before use on health promotion.

Key messages:

- MS-Diet demonstrates how diet optimization can be used to design dietary advice adapted to user's needs and food preferences.
- MS-Diet is a promising tool to help individuals improving their diet but requires qualitative and quantitative evaluation for further improvements.

National survey on telemedicine education and training among medical students and residents in France

Robin Ohannessian

R Ohannessian[1,2,3], S Yaghobian[1], T Iampetro[4], I Riom[5], N Salles[6,2], A Matthieu-Frtiz[7,2], T Moulin[8,2]

Contact: robin.ohannessian@telemedecine-360.com

Telemedicine was defined in France in 2009 and until 2017 integrated into the official medical school and residency programs. A national survey among medical school deans indicated a lack of implementation of telemedicine education and training despite positive attitudes towards it. In September 2018, teleconsultation started to be reimbursed for all doctors and patients by the National Health Insurance.

The objective was to describe the knowledge, attitudes, and practices of medical students and residents in France on telemedicine. A national voluntary online questionnaire-based survey was conducted from December 15th, 2018 to March 3rd, 2019. The survey was shared by the French Society of Telemedicine (SFTelemed), the National Association of French Medical Students (ANEMF), and the National Union of Medical Residents (ISNI).

There were 3329 answers, with 67.5% of participants being women and 69.8% being medical students and 30.2% residents. In total, 82.8% declared telemedicine was relevant to improve access to care. 84.8% did not know telemedicine regulations at all. 86.9% declared they knew the definition of teleconsultation and only 40.3% for tele-expertise. 14.4% received telemedicine theoretical education, and 97.9% stated they were not trained enough. 7% practised telemedicine during their medical school education and 30% during residency. Among them 60.2% practiced telemedicine less than 5 occasions. Among those who did not practise telemedicine during their education, 82.6% answered that they would want to practice telemedicine before the end of their studies.

Medical students and residents in France have a positive attitude towards telemedicine, however, were limited to its practice. Majority of participants declared they want to be educated and trained for telemedicine during their studies. This is the first national scale study in the world and should be applied in France for other healthcare professionals and other countries.

Key messages:

- Telemedicine education and training should be provided to medical students and resident during their curriculum.
- Medical schools and residency programs need to integrate and apply telemedicine in their programs.

Research Implications for future telemedicine studies and innovations

Lorenz Harst

P Timpel[1], L Harst[2]
[1]TU Dresden, MKII, Prevention and Care of Diabetes, Dresden, Germany
[2]TU Dresden, ZEGV, Forschungsverbund Public Health Sachsen, Dresden, Germany
Contact: lorenz.harst@tu-dresden.de

Despite the increasing application of information and communication technologies (ICT) in health care, robust data on the effectiveness and implementation of digital health solutions is lacking. Therefore, the objective of this analysis is to identify and categorise implications for future research in order to inform policy and practice decisions.

Systematic reviews and meta-analyses of RCTs evaluating the effectiveness of telemedicine in chronic diseases, all identified via a recent umbrella review, were used as primary sources of information. Qualitative content analysis following Mayring (2000) was used to categorize future research topics mentioned in the discussion sections and conclusions of included research published after 2015. Parallel, independent data extraction and coding using inductive category development was performed by two researchers with previous coding experience. Any disagreements were solved by discussion.

Of the 25 included systematic reviews and meta analyses, 23 reported on future research implications. They were categorised as follows: (1) Need for high quality studies including specific outcome measures; (2) Need for comprehensive technology assessment; (3) Need for in-depth considerations of patients' characteristics & more diverse study populations; (4) Ethics & Safety; and (5) Translation & implementation strategies. A codebook comprising descriptions and examples of those categories and sub-categories was developed.

Results show a need for larger and more rigorous studies with longer intervention durations, mid- to long-term follow-ups as well as more heterogeneous study populations. More pragmatic study designs to evaluate multimodal and tailored interventions like telemedicine solutions are needed to develop an improved understanding on mechanisms and target-group specific effectiveness.

Key messages:

- We need a stronger focus on relevant and well-designed studies to improve the impact of telemedicine trials.
- Identified needs have the potential to inform future guidelines for the use of telemedicine.

Telepathology and second opinion for cancer diagnosis in sub-Saharan French-speaking countries

Louise Petit

Many healthcare disparities can be described to explain cancer prevalence differences between developed and developing countries. Telepathology, telemedicine declination consisting in the transmission of digital images from a classical optical microscope combined with a digital camera linked to a computer, could offer a healthcare solution by enabling efficient communication between physicians and reinforcing multidisciplinary approaches. This study evaluated a pilot telepathology project using the 'i-Path' platform in Sub-Saharan French-speaking countries. This is a descriptive retrospective study. This study was made in two steps: (1) quantitative description of the platform's use by the pathologists group and (2) qualitative evaluation of the users' perception of the pilot project. From October 2009 to March 2018, 226 cases were submitted; 86·3% of them (n = 195) were analyzable. More than 30 experts in surgical pathology of 12 different countries were involved in the network. The average turnaround-time was less than one day. The main highlighted obstacles were the lack of time to submit cases and internet connection problems. Discussions on i-Path lead to a useful second opinion for 67·7% (n = 132) of the cases. The major part of second opinion was in favor of lymphoma (32·6%). Regarding children, lymphoma represent half of the second opinion (50·7%). The inter-observers agreement between first interpretation and second opinion was $\kappa = 0{\cdot}36$, and $\kappa = 0{\cdot}58$ after excluding non-diagnosed cases at submission. Even if some improvements can be made, we concluded that the project was satisfying and workable and it could be extended to other applications.

Key messages:

- Dialogue between expert in multiple LMIC is feasible with telepathology network and, as 1st diagnosis assessment is not always sure, telepathology help for 2nd opinion.
- Centers' use of the telepathology system are different but the discussion between experts still provide a 2nd opinion in favor of a precise diagnosis.

Digital media: How to adapt digital media to promote health of young people?

Manon Colard

D Durand[1], L Vassieux[1], J-F Dodet[2], I Millot[1]
[1]Instance Régionale d'Education et de Promotion pour la Santé - Bourgogne-Franche-Comté, Dijon, France
[2]Agence Régionale de Santé - Bourgogne-Franche-Comté, Dijon, France
Contact: m.colard@ireps-bfc.org

A priority of the French government health section is to promote strategies to develop teenager and young adult abilities to manage their own health. Interventions must be based on digital tools on how to improve it. The Pass'santé Jeunes (PSJ) is a regional measure based on a global, positive, community approaches, and on peers interventions. Managed by the Agence Régionale de Santé since 2013, and lead by the Instance Regional d'Education et de Promotion pour la Santé, this program consists of the provision of two portals: Pass'santé Jeunes and Pass'santé pro.

This project aims to renew prevention approaches with youths, and to develop a common culture around efficient intervention strategies with professionals for linkage in digital practices. This initiative has been developed and collaborated with the targeted public, parents, and professionals. We queried the opinions of a youth panel, and requested advice of experts to assure relevance and veracity of the information. Websites were then created for professionals to locate information to support their missions.

Analysis of the actual uses of the PSJ were conducted by the University of Burgundy in 2016. Results showed much of the research leaning toward the creation of a prevention tool. For alignment with internet use by youths, we adapted the variety of media (quizzes, videos, apps...). In 2018, the average monthly audience of both sites increased significantly.Greater utilization of these resources is explained by increased awareness by professionals and prevention missions of health students.

In the health sector, challenges exist in understanding digital practices of youth and professionals, therefore it is important to play a key liaison role. First identified as an informational medium, these devices are now real resources for meeting and circulating knowledge.Prospects for 2020 are to redirect these tools to the 0-8 years age group, adapt them to situations of disability, and expand to the pregnancy period.

Key messages:

- In line with digital practices of youth, the PSJ relies on innovative communication supports, available in different formats (videos, quizzes, games, apps...).
- Beyond an informational tool for the young, the PSJ turns out to be a tool of knowledge brockering. It facilitates networking, implementation of activities, and improving health practices.

Children and digital devices: a survey on risk perception and use

Loredana Covolo

L Covolo[1], J Roncali[2], D Zaniboni[2], V Mapelli[3], E Ceretti[1], U Gelatti[1]
[1]Unit of Hygiene, Epidemiology and Public Health, University of Brescia, Brescia, Italy
[2]Post-graduate School of Public Health, University of Brescia, Brescia, Italy
[3]Degree Course in Health Care, University of Brescia, Brescia, Italy
Contact: loredana.covolo@unibs.it

Background:

Paediatrics associations in different international contexts recommended avoiding the use of screen media in children ages 0-2 years and limiting the use to one hour per day for children ages 2-5 years. In the light of these guidelines, the aim of this study was to investigate risk perception in the general population and use of digital devices (DD) in preschool children.

Methods:

We carried out a cross-sectional study on 3115 Italian subjects including parents and non-parents, using an online survey. Parents answered questions about their children's DD use. We used multiple linear regression analysis to assess the potential predictors of devices' use in preschool children.

Results:

Overall 74% of sample think that the use of DD by preschool children is a risk for health. They perceive risks, such as having eye irritation (83%), having sleep disorders (65%) more than benefits, e.g. communicating with distant relatives (47%), and learning new words (40%). Parents of preschool children represent the 74% of all parents (N = 1869). The 56% of parents with only 0-2 years children think that is not correct the use of DDs in toddlers, however the 25% of them allow their children to use them. The mean time use reported is 63±57 minutes. Among parents who have also children from 2 to 5 years, the 89% think it is correct the use of DD up to a maximum of one hour a day for children aged 2-5 years. However, the 58% of them allow their children to use it more than one hour. The mean time use reported is 61±52 minutes. Parents without a job, having low education level, with more than one child and having children ages 3 and older, are more prone to allow the use of DD to their children.

Conclusions:

There is a discrepancy between risk perception and real attitude on DD use in children by parents. Public health actions must aim to increase awareness about a conscious use of DD in children considering the spread of DD in the society and younger people.

Key messages:

- The discrepancy between risk perception and actual behaviour means an underestimation of health impact of digital devices use in children.
- Health professionals are very concerned about the health risk of digital devices use in children. Considering the large use of digital devices, public health actors must pay attention to this matter.

2.D. Workshop: NCDs prevention through integrated approaches: reducing obesity from individuals to populations

Organised by: World Federation of Public Health Associations
Chair persons: Marta Lomazzi - Switzerland, Walter Ricciardi - WFPHA
Contact: marta.lomazzi@unige.ch

Non-communicable diseases, the slow motion disaster, represent one of the main global threats to health in the 21st century. Overweight and obesity are major risk factors for a number of chronic diseases and obesity has nearly tripled since 1975. Obesity can be prevented through healthy food, healthy lifestyle and anti-obesogenic environments. Effective multidisciplinary and intersectorial approaches are needed now more than ever and public health strategies should tackle the social determinants of health through the adoption of a common risk factor approach, which start from the mouth to reach the rest of the body. This applies to preventive actions, investments and advocacy with the government and the food industry.

This workshop aims to discuss challenges and leverages to increase integrated approaches to prevent NCDs through healthy nutrition, focusing on the need to tackle the body as a whole as well as providing the skills necessary to understand and play the power game related to food and food industry.

The workshop will start with a critical analysis of the key actions and debates at the global level, focusing afterwards on the sugar-sweetened beverage (SBB) laws and the need to re-legitimate the mouth as an integral part of the body to increase the effectiveness of prevention. The country case of Italy will give an important perspective from a country that has always been associated to the healthy Mediterranean diet but has reverted the trend in the last few years, especially among children. The debate will then lead to an analysis of the effective approaches, which can be applied to fight the obesity trend with a special focus on government roles and wrestling with industry.

The obesity prevention strategies as described above will be analysed through the Global Charter for the Public's Health (The Charter) lens, a joint effort of WFPHA, multiple stakeholders, as well as the WHO, which has been developed to provide a comprehensive, clear and flexible framework to adapt today's public health to its global context. The implementation of The Charter functions and services, through a flexible approach, paves the path to reverse the obesity trend and facilitate the development of effective measures through multidisciplinary and intersectorial partnerships and effective laws. An integral part of the process is leadership from inside and outside the health sector along with people, communities, organizations, governments, concerned corporates and citizens.

This workshop will provide delegates with the information, examples and skills necessary to understand and play an active role in the ''food power game'' through the adoption of common risk factor approach and increased advocacy skills by applying The Charter in Europe and globally.

Key messages:

- Integrated and multidisciplinary approaches, including the common risk factors approach, and effective advocacy with governments and concerned corporates are key elements to prevent obesity and NCDs.
- The Charter is the flexible and innovative framework to be applied from the communities up to their governments, at national and international levels to prevent diseases such as obesity and NCDs.

Will the world be obese in 2050?

Bettina Borisch

B Borisch[1]
[1]WFPHA, c/o Institute of Global Health, Geneva, Switzerland
Contact: bettina.borisch@unige.ch

The workshop will be started by B. Borisch by providing a critical analysis of the obesity problem and approaches adopted.

Why integration matters

Marta Lomazzi

M Lomazzi[1]
[1]WFPHA, c/o Institute of Global Health, Geneva, Switzerland
Contact: marta.lomazzi@unige.ch

M. Lomazzi will focus on the SBB example and the need to increase integration of oral and public health to rise the success of interventions.

The Italian case – reversing the obesity trend

Walter Ricciardi

W Ricciardi[1]
[1]WFPHA, c/o Institute of Global Health, Geneva, Switzerland
Contact: walter.ricciardi@unicatt.it

W. Ricciardi will present the Italian scenario with a critical analysis of the causes and approaches that are needed/on going to reverse the obesity increase trend in a country always associated to healthy food.

Is the solution really the 'Nanny State'. Arm wrestling with industry

Michael Moore

M Moore[1]
[1]WFPHA, c/o Institute of Global Health, Geneva, Switzerland
Contact: mimomph@gmail.com

M. Moore will discuss the nanny state approach and the arm wrestling with the food industry, providing examples and facilitating the development of key advocacy skills to play this power game.

2.E. Workshop: Quantifying burden of disease to support public health policy: exchange of views and experiences

Organised by: University of Bordeaux
Chair persons: François Alla - France, Jean-Claude Désenclos - France
Contact: francois_alla@yahoo.fr

Information on disease burden, risk factors, related healthcare costs and their variations over time represents a major concern for public health decision makers. These data could contribute to define priorities and strategies, to allocate resources and to evaluate health policies and interventions at regional and national levels. In this context, the use and synthesis of all available data is essential, whether these data were collected for the purpose of epidemiological surveillance, healthcare, research, and/or reimbursement. This process raises conceptual and methodological issues. The question of the use of these data by decision-makers is also essential and depends not only on their validity, but also on their credibility, their usability, and their capacity to respond to needs in the context of decision. There are now national experiences of production and use of these data. There are also international collaborations. In particular, the Global Burden of Disease (GBD) Study is an extremely structured process with extensive global collaboration.

The aim of this workshop is to exchange and share experiences on the different approaches, indicators, methods used in order to quantify the burden of disease; the use of health insurance databases as a source of data for quantifying burden of disease; the use of burden of disease information by public health decision-makers at national and local levels.

Key messages:

- Disease burden statistics are a resource for data-informed policy-making.
- Health insurance databases are a complementary source for quantifying disease burden.

The GBD project

Spencer James

S James[1]
[1]Institute for Health Metric and Evaluation, University of Washington, Seattle, USA
Contact: spencj@uw.edu

Presentation of the GBD project including data sources and methods, how it can be used to set priorities and develop a national public health policy.

The «cartographie» tool (CNAM, France)

Christelle Gastaldi-Ménager

C Gastaldi-Ménager[1]
[1]CNAM, Paris, France
Contact: christelle.gastaldi-menager@assurance-maladie.fr

Presentation of the "Cartographie" tool, a mapping of health care expenditures including disease categories and its use by the National Health insurance and policy makers. Complementarity with the GBD study will be discussed.

Global Burden of Disease Study: overview and experience from England

John Newton

J Newton[1]
[1]Public Health England, London, UK

Presentation of the joint action of health information objectives and the burden of disease action of the workpackage 9 (Innovation in health information for public health policy development).

2.F. Cultural and health behavioural change in adolescents

Cultural values and adolescents' health inequalities in 21 European countries

Maxim Dierckens

M Dierckens[1], *B De Clercq*[1], *B Deforche*[1,2]
[1]Department of Public Health and Primary Care, Ghent University, Ghent, Belgium
[2]Physical Activity, Nutrition and Health Research Unit, Vrije Universiteit Brussel, Brussel, Belgium
Contact: maxim.dierckens@ugent.be

Background:

culture is believed to have an important impact on health and health inequalities and this may vary between countries. Empirical data are however scarce, especially in adolescent populations. We examined the impact of cultural values (emancipatory values index) on cross-national variations in adolescent health, health inequalities and evolutions in these inequalities.

Methods:

individual-level data from 21 countries participating in the 2002/2006/2010/2014 waves of the Health Behaviour in School-aged Children (HBSC) study were combined with country-level data from the World Values Longitudinal Dataset (n = 416777). Multilevel linear and logistic regression analyses were performed accounting for the hierarchical data structure (individual, country-year and country level).

Results:

cultural value differences between countries were weakly related to adolescents' health and health behaviour but had a profound impact on the magnitude of inequalities. In countries characterised by a high level of emancipatory values, material (family affluence-based) inequalities in both health and health behaviours tended to be lower whereas non-material (occupational social class-based) inequalities tended to be higher, in particular for health behaviours. Preliminary results also indicated that cultural value differences between countries may play a significant role in the evolution of adolescent health inequalities.

Conclusions:

our findings suggest that between-countries' cultural value differences may partly explain cross-national variations in adolescents' health inequalities and in the evolution of these inequalities. By identifying cultural value differences in health, health inequalities and evolutions in health inequalities, this study helps informing policies better to tackle these inequalities.

Key messages:

- Cultural value differences between countries have a profound impact on the magnitude of inequalities in adolescents' health and health behaviours and on the evolution of these inequalities.
- Identifying cultural value differences in adolescents' health, health inequalities and evolutions in these inequalities is necessary to inform policies better to tackle these inequalities.

Changes in patterns of adolescent substance use from 1988 to 2011 in Sweden: a latent class analysis

Brittany Evans

B Evans[1], Y Kim[1], C Hagquist[1]
[1]Centre for Research on Child and Adolescent Mental Health, Karlstad University, Karlstad, Sweden
Contact: brittany.evans@kau.se

Background:

Prevalence rates of adolescent substance use have shifted over time, although potential changes in nuanced patterns of substance use remain unexplored. We examined patterns of adolescent substance use in Sweden and changes in these patterns between 1988 and 2011. Furthermore, we investigated whether gender and internalizing problems were associated with substance use and whether these associations changed over time.

Methods:

The sample included all 15-16-year-old students in Värmland County, Sweden (N = 20,057). Survey data were collected eight times between 1988 and 2011 and analyzed as four cohorts (1988/1991, 1995/1998, 2002/2005, 2008/2011). We measured alcohol, tobacco and inhalant use and internalizing problems.

Results:

A latent class analysis showed that a three-class model fit the data best (i.e. non/low use, experimental use, and polysubstance use classes). Class- and item-response probabilities changed over time: fewer adolescents exhibited riskier substance use patterns in the later cohorts. Boys were more likely than girls to be in the polysubstance use class compared to the non/low use class across all cohorts (all ps < .001). Gender differences in experimental use differed across the cohorts. Adolescents who reported more internalizing problems were more likely to be included in the experimental and polysubstance use classes compared to the non/low use class (all ps < .001) and this effect did not change over the study period.

Conclusions:

We extended the research on trends in rates of substance use by mapping how patterns of substance use changed over time as well as how the effects of gender and internalizing problems shifted. While fewer adolescents exhibited riskier patterns of substance use in the later cohorts, these patterns were associated with experiencing more internalizing problems across the study period. Prevention efforts could be more effective by targeting patterns of substance use rather than prevalence rates.

Key messages:

- We tested whether patterns of adolescent substance use changed from 1988 to 2011 in Sweden. Fewer adolescents showed riskier substance use patterns in the late 2000s than in the earlier study years.
- Gender differences shifted over time for experimental use but not polysubstance use. Internalizing problems were consistently associated with riskier substance use patterns across the study period.

Lifestyle of young adults – changes and accumulation

Tuija Jääskeläinen

T Jääskeläinen[1], P Koponen[1], A Lundqvist[1], K Borodulin[1], S Koskinen[1]
[1]Department of Public Health Solutions, National Institute for Health and Welfare, Helsinki, Finland
Contact: tuija.jaaskelainen@thl.fi

Background:

Young adulthood is a pivotal period for many lifestyle factors becoming established and later affecting health. However, current knowledge on key lifestyle factors among young adults is limited. This study aimed to examine the lifestyle of Finnish young adults and the changes in their lifestyle between the years 2000 and 2017. Further, the accumulation of health promoting and endangering lifestyle factors was evaluated.

Methods:

The study is based on nationally representative data on young adults (aged $18-29$ years) from the Health 2000 Survey (n = 1894; 90% participated) and the FinHealth 2017 Study (n = 1162; 54% participated). Lifestyle factors were assessed in the interview and by questionnaires. The five key lifestyle factors (use of vegetables, smoking, physical activity, sleep and alcohol consumption) were dichotomized for the evaluation of the accumulation. Weighted prevalences were analyzed by logistic regression taking into account the sampling design and non-response.

Results:

In 2017, 32% (95% CI 25, 41) and 52% (95% CI 45, 60) of young men and women used fresh vegetables daily, respectively. In men, the prevalence had decreased in 2017 compared to 2000 ($p < 0.01$). The prevalence of daily smoking had decreased ($p < 0.01$) being 11% in both sexes in 2017. In men, the prevalence of the daily use of snuff had increased from 3% (95% CI 2, 5) to 8% (95% CI 5, 14) in 2017 (p = 0.01). In both years, three out of four were physically active at leisure-time and nine out of ten slept at least six hours per day. In 2017, half of the young adults reached 4 to 5 (maximum) health promoting factors whereas 17% (95% CI 11, 24) of men and 12% (95% CI 8, 18) of women reached only 0 to 2.

Conclusions:

There have been both favourable and unfavourable changes in the lifestyle of young adults during the last decades. The accumulation of health promoting and endangering lifestyle factors was observed indicating needs to versatilely prevent risks for major public health problems.

Key messages:

- Many health-endangering lifestyle factors are comparatively common in young adults.
- It is important to prevent the accumulation of health-endangering lifestyle factors in young adulthood to lower the risks for major public health problems in future.

Which are the communication styles of anti-tobacco spots that most impress adolescents?

Alice Mannocci

A Mannocci[1], V D'Egidio[1], F Guerra[2], Y De Marco[1], MR Gualano[3], A Firenze[4], D Giordano[4], G Boccia[5], R Siliquini[3], G La Torre[1]
[1]Department of Public Health and Infectious Diseases, Sapienza University Rome, Rome, Italy
[2]Department of Oral and Maxillo-Facial Sciences, Sapienza University Rome, Rome, Italy
[3]Department of Public Health, University of Turin, Turin, Italy
[4]Department of Sciences for Health Promotion and Mother-Child Care, University of Palermo, Palermo, Italy
[5]Department of Hygene, University of Salerno, Salerno, Italy
Contact: alice.mannocci@uniroma1.it

Objectives:

To evaluate emotions and opinions of Italian adolescents aged 13-18 years old about different anti-tobacco spots delivered by the mass media campaigns over the world.

Methods:

A multicenter cross-sectional study was conducted. Italian students from different regions were enrolled. A video that collected 7 anti-tobacco spots from all over the world. The spots describe the tobacco dependence, the health damages and the tobacco components using different communication styles (funny, scientific, dramatic, comedians, shocking, and sad). Information on age, gender, smoking status of family and peers were gathered. Descriptive and univariate analysis of emotional and cognitive reactions to spots were performed with respect to gender, smoking status of adolescents, their peers and parents.

Results:

495 students were enrolled. 14% of them were current smokers. Two spots resulted to have most impressed the students: Sponge (29%) and Icons (18%). In the first spot the sponges represent human lungs, a pair of hands squeeze the tar from the sponge, revealing the cancer-producing tar that goes into the lungs of a pack-a-day smoker every year. The second one contrasts tobacco industry images such as a cowboy, a hip-hop DJ with a more accurate depiction of the repercussions of smoking: a dying man in a wheelchair who warns, ‘The reality is you can end up looking like this’. The reactions on these videos are disgust, reflection and sadness, respectively: Sponge 79%, 44% and 15%; Icons 60%, 3% and 20%. Univariate analysis showed differences by smoking status about video considered most impressive ($p = 0.02$) and by gender about the choice of spot in the role of the Minister of Health ($p < 0.001$).

Conclusions:

The spot media campaigns that gave a clear and scientific message or that changed the ‘‘icon’’ of the smoker were preferred by adolescents. Further research is needed to study adolescents’ responses and smoking outcomes obtained by different anti-tobacco mass media campaigns.

Key messages:

- The study demonstrates the preference of adolescents for spot giving clear scientific messages or using strategies that fight manipulation of the tobacco industry and aimed at changing smoker’s icon.
- The present study underlines that it is necessary to monitor the effect of a multimedia campaign and to examine its longitudinal impact, especially its impact on smoking behavior.

Participation of disadvantaged school age children (7-18) in health inequality projects

Maja Jovanovic

M Jovanovic[1]

[1]Public Health Program, Open Society Foundations, Public Health Program, Berlin, Germany

Contact: maja.saitovic@opensocietyfoundations.org

The descriptive research was conducted in the period from September until December 2018 involving projects tackling health inequalities of children 8-17 years old. The sample included 10 projects funded by the Directorate General for Health and Consumer Protection from its 3rd Health Programme (2014-2020) listed on the Consumers, Health, Agriculture and Food Executive Agency website. The study methods involved desk review of 10 selected projects, 6 semi-structured questioners and 6 interviews. Data were analyzed according to 4 participatory principles: relationship building, storytelling, strategizing action and supporting organizational structures to support execution of these actions, as outlined in the Leadership, Organizing and Action: Leading Change course thought by the Harvard School of Public Health.

Results:

The preliminary finding is that none of the ten selected projects have identified children 7-18 years old as a primary target group. Majority of the projects (4 out of 6) involve sort of relationship building with children, while storytelling is used by a smaller number of projects (2 out of 10). All projects (6 out of 6) involve children just in the implementation phase focusing on educating children and none of them in the project design phase. Moreover, children covered by the implementation are mainly included through schools (8 out of 10) due to a missing parent consent for interacting with most disadvantaged children that are not in schools.

Conclusions:

There is a serious lack of awareness on the importance of meaningfully engaging disadvantaged children in health programming processes for decreasing existing health inequalities. Due to a significant lack of meaningful participation of disadvantaged children in majority projects tackling health inequalities of school-age children in Europe there is a serious risk of having these inequalities increased rather than overcome, despite significant financial and human investments.

Key messages:

- The most disadvantaged children should be meaningfully engaged in design, implementation and evaluation of health inequality projects that are of their immediate concern.
- There is a need for more in depth research on health inequalities faced by school age children (7-18) that are out of educational system.

Transition into secondary education and health-compromising behaviours: A longitudinal study

Arja Rimpelä

A Rimpelä[1]*, H Dobewall*[1]*, S Karvonen*[2]*, L Koivusilta*[3]*, P Lindfors*[1]*, JM Kinnunen*[1]*, M-P Vainikainen*[4]*, L Kortesoja*[5]

[1]Faculty of Social Sciences, Tampere University, Tampere, Finland

[2]Social Policy Research Unit, National Institute for Health and Welfare, Helsinki, Finland

[3]Faculty of Social Sciences, University of Turku, Turku, Finland

[4]Faculty of Education, Tampere University, Tampere, Finland

[5]Centre for Educational Assessment, University of Helsinki, Helsinki, Finland

Contact: arja.rimpela@tuni.fi

Background:

We studied the associations of health-compromising behaviours with a transition into secondary education by following a large cohort of Finnish adolescents. Students with a direct (successful) transition into secondary education after the 9th grade (73%) and those with a late transition (7%) were compared.

Methods:

We analysed the following health behaviours in the 7th and 9th grades collected in school surveys in the Helsinki Metropolitan Area: late bed time, irregular breakfast pattern, tooth brushing less than twice a day, monthly alcohol consumption, smoking, regular energy drink consumption, physical activity level under recommendations, and excessive screen time, as well as clustering of these behaviours.

Results:

In logistics regression models (adjusted for gender, school), in the 7th grade all health-compromising behaviors except physical inactivity were related to the late transition, and in the 9th grade energy drink, smoking, breakfast, tooth brushing and screen time. In multivariate models (controlled for academic achievement, immigrant status, language spoken at home, and parents’ education) only bed time was independently associated in both grades. Bed time, breakfast, tooth brushing, alcohol, smoking, and energy drink formed three behavioral clusters -healthy, mixed, and unhealthy lifestyles. The last two predicted the late start in both grades; in multivariate models unhealthy only. Change in academic achievement over time, but not in lifestyle, predicted the transition.

Conclusions:

Students with unhealthy lifestyle are more likely to start secondary education later than those with healthy lifestyle meaning also postponing of their graduation and start of working life.

Key messages:

- The unhealthy lifestyle of those who start secondary education later than average, may be one of the mechanisms in the origin of socioeconomic health differences in later life.
- Healthy lifestyle as early as 13 years predicts successful educational paths.

Use of e-cigarettes by young people in Great Britain before and after Tobacco Products Directive

Linsay Gray

G Moore[1], R Brown[1], N Page[1], B Hallingberg[1], L Gray[5], O Maynard[4], J McKell[3], L Bauld[2]
[1]DECIPHer, Cardiff University, Cardiff, UK
[2]Usher Institute of Population Health Sciences & Informatics, University of Edinburgh., Edinburgh, UK
[3]Institute for Social Marketing, University of Stirling and UK Centre for Tobacco and Alcohol Studies, Stirling, UK
[4]MRC Integrative Epidemiology Unit (IEU) at the University of Bristol, Bristol, UK
[5]MRC/CSO Social and Public Health Sciences Unit, University of Glasgow, Glasgow, UK
Contact: Linsay.Gray@glasgow.ac.uk

Background:

Young people's experimentation with e-cigarettes has increased in recent years, although regular use remains rare. In May 2016, the EU Tobacco Products Directive (TPD) introduced regulations aimed in part at preventing use by young people. It imposed warnings on e-cigarette packets, banned many forms of advertising, and restricted nicotine strength. This paper examines change in young people's e-cigarette use after TPD, as well as complementary and alternative causal explanations for change, from young people's perspectives.

Methods:

Quantitative data sources were 2013, 2015 and 2017 School Health Research Network/Health Behaviour in School-aged Children surveys in Wales and 2014 and 2016 Smoking Drinking and Drug Use surveys in England. Data were analysed using segmented binary logistic regression in Wales, with simpler before and after analyses in England. Results were considered alongside qualitative interview data from young people aged 14-15 years in England, Wales and Scotland, collected in 2017 and 2018.

Results:

Ever-use of e-cigarettes almost doubled from 2013-15, though subsequent increases were smaller. In Wales, where pre-legislation time series data were available, under a range of assumptions, prior growth in e-cigarette ever-use did not continue post-TPD. Change in trend post-TPD did not reach significance (OR = 0.96; 95%CI = 0.91 to 1.01), but became significant after adjusting for change in smoking rates across the time-series (OR = 0.93; 95%CI = 0.88 to 0.98). Regular use did not increase significantly from 2015 to 2017 in Wales, although ever and regular use in England both increased from 2014 to 2016. Young people described limited interactions with core components of TPD, while commonly describing e-cigarette use as a fad which was beginning to run its course.

Conclusions:

Growth in youth experimentation with e-cigarettes may be slowing. Qualitative data from young people provide a range of explanations which appear largely unrelated to TPD itself.

Key messages:

- Survey data provide preliminary evidence that use of e-cigarettes may be plateauing among young people in the UK after a rapid initial increase in experimentation.
- Explanations position e-cigarettes as a passing fad which is beginning to lose its appeal in UK youth. Longer term monitoring of trends and perceptions remain vital.

Social network characteristics and alcohol use among young Swedes with different ethnic backgrounds

Alexander Miething

A Miething[1], NK Gustafsson[1], M Rostila[1], J Rydgren[2]
[1]Department of Public Health Sciences, Stockholm University, Stockholm, Sweden
[2]Department of Sociology, Stockholm University, Stockholm, Sweden
Contact: alexander.miething@su.se

Background:

The study explores how social network determinants relate to the prevalence and frequency of alcohol use of members of social networks. In a so-called dyadic design we study how similar alcohol habits co-exist among individuals (egos) and their peers (alters), when variables such as ethnic background, network composition, and other socio-cultural aspects are considered.

Methods:

The data were derived from a Swedish survey entitled ''Social Capital and Labor Market Integration: A Cohort Study.'' The study participants (egos; n = 1989) were around age 23 at the time of the interview. A so-called dyadic design was applied, which means that all components of the analysis refer to ego-alter pairs (n = 7828).

The outcome variable considered how alcohol prevalence and frequency of binge-drinking co-exist between egos and their alters. The independent variables also measured mutual attributes and behaviors - whether egos and alters were at the same age and sex, had same ethnic background, were relatives or friends, had similar religious affiliations, or intensely interacted with friends.

Results:

The analysis revealed that ego-alter similarity in terms of age, sex and ethnic background predict ego-alter similarity in alcohol use and binge-drinking. For example, if egos and alters shared a similar ethnic background, their risk of alcohol use was at least 30 percent higher as compared to those with different ethnic backgrounds. Relative to ego-alter pairs with mixed ethnic backgrounds, the odds of binge-drinking were highest for ego-alters pairs with Yugoslavian background (OR 1.76; 95% CI 1.27-2.42), followed by those with Iranian (OR 1.57; 1.04-2.35) and Swedish background (OR 1.28; 0.84-1.95).

Conclusions:

We conclude that network similarity (i.e., homophily) is an important explanation for the co-existence of alcohol use among members of peer networks. Alcohol use is more common in homogeneous peer dyads representing population groups with higher use.

Key messages:

- Peer similarity predicts alcohol use and binge drinking.
- Ethnic similarity of peers is associated with increased alcohol use and binge drinking.

2.G. Multiple chronic conditions: monitoring and care delivery

Implementing integrated care for multi-morbidity: analysis of experiences in 17 European programmes

Verena Struckmann

V Struckmann[1], W Looman[2,3], E van Ginneken[1,4], R Bal[2,3], R Busse[1], M Rutten-van Mölken[2,3]
[1]Department of Healthcare Management, TU Berlin, Berlin, Germany
[2]Institute for Health Policy and Management, Erasmus University Rotterdam, Rotterdam, Netherlands
[3]Institute for Medical Technology Assessment, Erasmus University Rotterdam, Rotterdam, Netherlands
[4]Department of Healthcare Management, European Observatory on Health Systems and Policies, Berlin, Germany
Contact: verena.struckmann@tu-berlin.de

Background:

Many countries are experimenting with new models of care provision and numerous integrated care programmes have been established internationally. However, little information is available on how to implement integrated care. The aim is to provide more in-depth insights in the implementation of integrated care for developers and managers of integrated care programmes, policy makers, health insurers, and researchers.

Methods:

17 integrated care programmes addressing multi-morbidity were selected and studied in 8 European countries as part of the Horizon 2020-funded project SELFIE (Sustainable intEgrated care modeLs for multi-morbidity: delivery, FInancing and performancE). An overarching analysis with data extraction forms of the Thick Descriptions completed for all 17 programmes in combination with previous insights from the literature was applied. Information about the implementation of integrated care was extracted and coded according to the six components of the SELFIE framework: service delivery, leadership & governance, workforce, financing, technologies & medical products, and, information & research and sub-elements of each component at the micro, meso and macro level.

Results:

The results show the interrelatedness of the six SELFIE framework components and that alignment work between them, different elements and levels is important. The meso-level seems to be the driving force of implementation and that a stepwise approach to change by building upon what is already there (e.g. existing collaborative networks) and gradually expand and broaden the scope of the integrated care programmes was supportive.

Conclusions:

Implementation activities should simultaneously focus at the micro, meso and macro-levels at which integration occurs as they strongly influence each other. Alignment of the integrated care programme and the active influence of the macro-level context by creating an enabling environment facilitates successful implementation.

Key messages:

- Integrated care should be implemented with an incremental growth model rather than from a disruptive innovation approach.
- Integrated care should involve bottom-up and top-down implementation at different levels of the programme.

Monitoring of non-communicable diseases in Belgium

Aline Scohy

B Devleesschauwer[1,2], LA Abboud[1], P Bogaert[1,3], A Cornez[1], L Raes[1], A Scohy[1], J Van der Heyden[1], F Renard[1]

[2]Department of Veterinary Public Health and Food Safety, Ghent University, Merelbeke, Belgium

[3]School of Social and Behavioral Sciences, Tilburg University, Tilburg, Netherlands

Contact: aline.scohy@sciensano.be

Non-communicable diseases (NCDs) account for the highest share of deaths and burden of disease in Belgium. Nevertheless, there is currently no national plan to prevent and monitor the health impact of NCDs. Recently, two initiatives have been launched by Sciensano, the Belgian institute for health, providing new opportunities for monitoring NCDs in an integrated and comparable way - i.e., the Belgian Health Status Report (HSR) and the Belgian National Burden of Disease Study (BeBOD).

The HSR, launched in February 2019, integrates health status information in a continuously updated website: www.healthybelgium.be. Key indicators, identified through literature and stakeholder consultations, highlight specific needs and warning signals. Currently, the HSR integrates self-reported information on NCD prevalence from the Belgian Health Interview Surveys, with objective information on cancer and diabetes from the Belgian Cancer Registry and health insurance data, respectively. Future versions will include a broadened scope with national best estimates for other NCD groups.

The BeBOD study was launched in 2016, aiming to provide a first set of internally consistent burden estimates by 2020. BeBOD will complement the HSR by integrating information on morbidity and mortality of NCDs into a single measure of burden of disease - the Disability-Adjusted Life Year (DALY). DALYs quantify the number of healthy life years lost due to disease, and allow comparing the burden of fatal and non-fatal conditions. Annual updates of the BeBOD study will further provide unprecedented opportunities to monitor the impact of NCDs over time.

In addition to the new opportunities provided by the HSR and BeBOD study, NCD monitoring requires continued investment in active data collection and integration of available data sources. In term, these NCD monitoring systems will provide a solid basis for evaluating the impact of NCD control policies.

Key messages:

- There is currently no national plan to prevent and monitor the health impact of non-communicable diseases in Belgium.
- The Belgian Health Status Report and the Belgian National Burden of Disease Study provide new opportunities for monitoring non-communicable diseases in an integrated and comparable way.

Multimorbidity and quality of life: longitudinal analysis of the European SHARE database

Contact: tatjana.makovski@lih.lu

Multimorbidity defined most commonly as co-existence of 2+ diseases is one of the major challenges of an ageing society. It is often accompanied with declining quality of life (QoL). The study aims to 1) assess the relationship between increasing number of diseases and QoL over time, 2) explore the differences between several European countries. Longitudinal data analysis performed on the relevant waves (2004 to 2017) of the Survey of Health, Ageing and Retirement in Europe (SHARE). Data were collected every two years among participants aged 50+. Health conditions were identified through an open-end questionnaire containing 17 prelisted conditions. QoL was evaluated by Control, Autonomy, Self-Realization and Pleasure questionnaire (CASP-12v). Maximum QoL score, describing the best state was 48; minimum, 12 points. Association between increasing number of diseases and QoL is being assessed with multilevel analysis accounting for time and clustering within household and country. Minimum follow-up is 2 time points. Confounding variables include age, sex, socio-economic status, social support and health care parameters.

Preliminary findings show that 20 countries and 87,087 individuals participated in at least 2 waves; 80,041 answered CASP at least twice. Number of diseases when first reported was on average 1.65 (IQR = 0,2) and increased to 1.88 (IQR = 1,3) when last reported. Similarly, between first and last reported point QoL decreased on average by -0.32 (SD: ± 5.9); estimated by non-rescaled CASP scale. Greece showed the strongest decrease of -1.73 (SD: ± 6.36), while QoL increased in some countries, the most in Portugal for 0.76 (SD: ± 5.62). Our preliminary findings suggest high geographic variations in QoL, possibly driven by differential clustering of multimorbidity across Europe, design issues and other factors. This may underline the need for country-specific analysis and initiatives to address the growing burden of multimorbidity in our ageing populations.

Key messages:

- First longitudinal study to address this research questions across wide range of European countries using SHARE.
- Study accounts for large number of confounding factors owing to the abundance of collected information.

Personalized action plans for patients with multiple chronic diseases in Andalusia

Ana M Carriazo

AM Carriazo[1], I Cosano[2], C Lama[1], JJ Bedoya[2], M Ollero[2], N Lafuente[2], S Rodriguez[1], R Rodriguez-Acuña[3]
[1]Regional Ministry of Health and Families of Andalusia, Seville, Spain
[2]Andalusian Health Service, Seville, Spain
[3]Andalusian Public Foundation Progess and Health, Seville, Spain
Contact: anam.carriazo@juntadeandalucia.es

Issue/problem:

Complex chronic patients (CCPs) present multiple chronic conditions and complex healthcare needs. Comprehensive care by multiple healthcare professionals at different settings is required to improve their outcomes. This challenge is faced by the Andalusian Public Health System (APHS), responsible for the provision of healthcare and public health services to the entire Andalusian population (8.5 million inhabitants).

Description of the problem:

Almost 250000 CCPs have been identified within the APHS in 2018. The very complex ones (4%) utilise up to 30% of primary care and hospital resources.

The Comprehensive Healthcare Plan for Patients with Chronic Diseases was launched in 2012 to ensure the comprehensive care for these patients with a multidisciplinary response. Together with the Integrated Care Process Healthcare for Multimorbidity Patients, set the scene for implementing integrated healthcare with coordination of professional services and/or centres over time, helping to decrease clinical variability and improve quality of care.

Results:

Since 2016, Personalized Action Plans (PAPs) were introduced as key-elements to provide a holistic care coordinated at primary healthcare, including:

- taking patient's individual needs, preferences and own resources as a starting point for their evaluation and the development their PAPs,
- involving of patient's informal caregivers,
- involving all relevant care levels and health disciplines,
- ensuring the multidisciplinary care with a coordinating team.

Lessons:

PAPs are a key element in the healthcare process for CCPs, and the assessment of its implementation in Andalusia is contributing to generate evidence within the Joint Action on Chronic Diseases (CHRODIS+, www.chrodis.eu).

Key messages:

- PAPs implementation and assessment are crucial to better address CCPs health needs, facilitating a patient-centred healthcare approach, and contributing to a European model of care.
- Involving patient, family carers together with the professional team facilitates achieving better healthcare outcomes.

Distribution of Cancer cases and survival analysis results: A retrospective cohort study

Erkan Pehlivan

E Pehlivan[1], B Mete[2], V Söyiler[2]
[1]Inonu University, School of Medicine, Battalgazi/Malatya, Turkey
[2]Provincial Health Directorate, Public Health Department, Bingöl, Turkey
Contact: erkan.pehlivan@inonu.edu.tr

Background:

Cancer was the second leading cause of death in Turkey. The aim of this study is to examine the changes in the incidence of cancer cases and survival analysis in a region.

Methods:

This retrospective cohort study was carried out on data of 977 people had been diagnosed with cancer between the years 2013-2015 in Bingol province located in the east of Turkey. All cancer cases are included in the study. The data of the patients were obtained from the Ministry of Health Cancer Registry System and International Disease Classification Oncology (ICD-O) codes published by World Health Organization were used. Patients were evaluated topographically (tissue originating from the lesion) in 41 categories. Kruskal Wallis, Mann Whitney U test, Chi-square test and Cox regression analysis were used to analyze the data.

Results:

The mean age of the patients was 58.73 ± 16.80 (min: 1-max: 107). It was observed that 28.7% of the patients died during the follow-up period and 71.3% of the patients were alive. 30% of the cancer cases digestive system, 11% respiratory system, 23% female breast- genitalia, 15% blood-lymph-thyroid, 11.8% muscle-bone, 15,4% other cancer species. In men, lung, stomach, colon, prostate; breast, thyroid and skin cancers are more common in women respectively. The incidence rate for all age groups was 97 per hundred thousand in 2013, 161 per hundred thousand in 2015. The increase trend did not differ by gender. The mean follow-up period of the patients who died was 388 days and 1541 days for the living patients. The risk of death is increased significantly in patients who cannot be operated (RR = 2.779, HR = 3.048). In patients not receiving chemotherapy, the risk of death is reduced significantly (RR = 0.656, HR = 0.340).

Conclusions:

The incidence of cancer increases in the study area. Survival times vary according to treatment efficacy. Broad-based cohort studies evaluating the effects of treatment types on survival may be recommended.

Key messages:

- Cancer in the study area shows a significant increase from year to year.
- The average 5-year survival period of cancer patients was found is 71% as a good result.

Association between cancer and neurodegenerative disorders including dementias; a systematic review

Louisa Gagatsis

LG Gagatsis[1], EF Ford[1], SB Bremner[1], PP Paudyal[1]
[1]Department of Primary Care and Public Health, Brighton and Sussex Medical School, Brighton, UK
Contact: l.gagatsis@bsms.ac.uk

Background:

Several studies have examined associations between neurodegenerative disorders (ND) including dementia, and cancer. However, the associations and directions of these relationships vary by types of ND and cancer. In the current context of ageing populations and increased incidence of ND, dementia and cancer, and existing comorbidity between these disease groups, a better understanding of these relationships could, in future, inform prevention and therapeutics. This systematic review summarises the epidemiological evidence on these associations.

Methods:

PubMed, MEDLINE, Embase, Scopus and Web of Science were searched to identify relevant studies published by 31/12/2018. The search strategy included a combination of search and MESH terms related to ND (e.g. Alzheimer's, dementia), cancer and study design (case-control, cohort). The quality of included studies was assessed using the Newcastle-Ottawa scale (NOS).

Results:
77 studies were eligible for inclusion. The majority of studies scored 6+ on the NOS scale and some reported significant associations between ND and cancer. The association with specific types of cancer was not as evident as with all cancers. An inverse relationship was found between NDs and particularly Alzheimer's, Parkinson's, and Dementia and Cancer. Only one study found no association between Vascular Dementia and Cancer.

Conclusions:
The findings report an overall inverse association between NDs and all cancers but associations are less evident with specific cancer types. Results from this review can be helpful in recommending reporting standards for future research to reduce heterogeneity between studies.

Key messages:

- Exploring the intersection of neurodegenerative disorders/ dementia and cancer might help redirect research to novel therapeutic approaches.
- A standardised approach in design and outcome measurement is necessary to reduce heterogeneity across the studies.

Metabolic syndrome and renal cell cancer risk in Chinese males: a population-based prospective study

Xin Li

X Li[1], G Wang[2], X Feng[1], Z Lyu[1], L Wei[1], S Chen[3], S Wu[3], M Dai[1], N Li[1], J He[1,4]
[1]Office of Cancer Screening, National Cancer Center, National Clinical Research Center for Cancer, Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College, Beijing, China
[2]Department of Oncology, Kailuan General Hospital, Tangshan, China
[3]Health Department of Kailuan (Group), Tangshan, China
[4]Department of Thoracic Surgery, National Cancer Center, National Clinical Research Center for Cancer, Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College, Beijing, China
Contact: zzugwxin@163.com

Background:
Metabolic syndrome (MetS) is now a common public health problem. Few researches have reported the relationship between MetS and the risk of renal cell cancer (RCC). To investigate the association of metabolic syndrome and its components with the risk of RCC in Chinese males, the study was performed in the Kailuan male cohort, a large prospective cohort study.

Methods:
A total of 104,333 eligible males enrolled in the every 2-year health checkup were involved in the Kailuan male cohort study (2006-2015). Information on demographic and socioeconomic characteristics, lifestyle, medical history and laboratory tests at baseline entry was obtained. Univariable and multivariable Cox proportional hazards regression models were used to estimate the association between MetS and the RCC risk.

Results:
During a median follow-up of 8.9 years, 131 RCC cases were verified over a total of 824,211.96 person-years. Among the 5 single MetS components, hypertension (Systolic/diastolic blood pressure$\geq$130/85 mm Hg or antihypertensive drug treatment of previously hypertension) (HR = 2.35, 95%CI:1.48-3.72) and elevated triglyceride (TG) ($\geq$1.7mmol/L) (HR = 1.78, 95%CI:1.23-2.56) showed significant risk for RCC. Multivariate analysis showed that compared to those who did not meet MetS diagnostic criteria (number of abnormal MetS components<3), HR of RCC risk for participants with MetS was 1.95 (95% CI 1.35-2.83). The number of abnormal MetS components was linearly associated with an increased risk of RCC (P trend<0.001), and the HRs of RCC risk for males with 1, 2 and $\geq$3 MetS components were 1.27 (0.56-2.90), 2.42 (1.12-5.20) and 3.32 (1.56-7.07), respectively, compared with subjects without MetS components.

Conclusions:
MetS was inversely associated with of RCC risk in males.

Key messages:

- MetS might be one of the scientific and important predictors of RCC.
- Controlling metabolic syndrome may potentially have key scientific and clinical significance for RCC prevention.

Sugary drink consumption and cancer risk: results from NutriNet-Santé prospective cohort

Eloi Chazelas

E Chazelas[1], B Srour[1], E Kesse-Guyot[1], C Julia[1,2], V Deschamps[3], P Galan[1], S Hercberg[1,2], P Latino-Martel[1], M Deschasaux[1], M Touvier[1]
[1]Nutritional Epidemiology Research Team (EREN), Sorbonne Paris Cité Epidemiology and Statistics Research Center (CRESS), Inserm U1153, Inra U1125, Cnam, Paris 13 University, Bobigny, France
[2]Public Health Department, Avicenne Hospital, AP-HP, Bobigny, France
[3]Nutritional Epidemiology Surveillance Team (ESEN), Santé Publique France, Saint-Maurice, France
Contact: e.chazelas@eren.smbh.univ-paris13.fr

Background:
The objective was to assess the associations between the consumption of sugary drinks (sugar sweetened beverages and 100% fruit juices), artificially sweetened beverages and cancer risk.

Methods:
Overall, 101,257 participants aged $\geq$18y (mean age: 42.2) from the French NutriNet-Santé cohort (2009-2017) were included. Consumptions of sugary drinks and artificially sweetened beverages were assessed using repeated 24h-dietary records, designed to register participants' usual consumption for 3,300 different food and beverage items. Associations between beverage consumption and the risk of overall, breast, prostate and colorectal cancer were assessed by multi-adjusted Fine&Gray Hazard models, accounting for competing risks.

Results:
The consumption of sugary drinks was significantly associated with overall cancer risk (n = 2,193 cases, sHRfor a 100mL/d increase = 1.18, 95% confidence interval 1.10 to 1.27, P<.0001) and breast cancer risk (n = 693 cases, sHRfor a 100mL/d increase = 1.22, 95% confidence interval 1.07 to 1.39, P = 0.004). The consumption of artificially sweetened beverages was not associated with cancer risk. In specific sub-analyses, the consumption of 100% fruit juice was significantly associated with overall cancer risk (n = 2,193 cases, sHRfor a 100mL/d increase = 1.12, 95% confidence interval 1.03 to 1.23, P = 0.007).

Conclusions:
In this large prospective study, the consumption of sugary drinks was positively associated with overall and breast cancer risks. Of note, 100% fruit juices were also positively associated with overall cancer risk. These results need replication in other large-scale prospective studies. They suggest that sugary drinks, which are massively consumed in Western countries, may potentially represent a modifiable risk factor for cancer prevention.

Key messages:

- In this large prospective study (n = 101,257), the consumption of sugary drinks (including 100% fruit juice) was associated with an increase in overall and breast cancer risk.
- In specific sub-analyses, 100% fruit juices were also associated with an increased risk of overall cancers. The consumption of artificially sweetened beverages was not associated with cancer risk.

2.H. Health services and innovative technologies

Challenges in building image-based diagnostic support deep-learning algorithm for acute burns

Constance Boissin

C Boissin[1], *J Fransén*[2], *F Huss*[2], *L Wallis*[4], *N Allorto*[3], *L Laflamme*[1], *J Lundin*[1]
[1]Department of Public Health Sciences, Karolinska Institutet, Stockholm, Sweden
[2]Uppsala University, Uppsala, Sweden
[3]Edendale Hospital, Pietermaritzburg, South Africa
[4]Division of Emergency Medicine, University of Cape Town, Cape Town, South Africa
Contact: constance.boissin@ki.se

Background:

Acute burns are complex to diagnose and erroneous assessments impact on the victim's mortality and morbidity. Specialists operate from a small number of burns centres and the capacity to provide timely assistance to front line clinicians is therefore limited. Diagnostic assistance through artificial intelligence could be an option to provide a timely and equitable diagnosis. This project sheds light on the feasibility of the development of an artificial intelligence algorithm for assisted diagnosis of acute burns and clarifies challenges faced along the way.

Methods:

A bank of images has been built from a number of burn centres in South Africa and is continuously being updated (currently about 1200 images). Attempts have been made to train deep learning algorithms to diagnose the burn depth, an element that is challenging both at bedside and using image-based teleconsultation. We came across methodological challenges that need further consideration.

Results:

Some challenges are clinical, i.e. inherent to the complexity of burn diagnosis, and imply the need of having an accurate diagnosis for the burn images on which the algorithm is trained. Other challenges pertain to the actual development of an algorithm. Prior to identifying burn depth a complex task relates to the feasibility of finding the burn itself in images of varying body parts and backgrounds. Further, training an algorithm for diagnosing burn depth also requires, large numbers of varying cases, the accurate labelling of the wound area for training, and decisions to be made as regards the best outcome to train upon. Current preliminary results indicate satisfactory identification of the burn area and promising results with regards burn depth diagnosis.

Conclusions:

Development of artificial intelligence algorithms require strong collaborations and discussions between technical and clinical experts but are showing promising results.

Key messages:

- Development of clinical image-based automated diagnosis involve a number of critical challenges on both the technical and clinical sides that need to be addressed prior to optimization.
- Once optimally developed, deep learning algorithms are a potential solution to assist with the reduction of the burden of burns on the health services by providing timely, and cost-effective advice.

Evaluating a digital sepsis alert in a multi-site hospital: a natural experiment

Kate Honeyford

K Honeyford[1], *GS Cooke*[2], *A Kinderlerer*[3], *E Williamson*[4], *M Gilchrist*[3], *A Holmes*[5], *B Glampson*[3], *A Mulla*[3], *C Costelloe*[1]
[1]Global Digital Health Unit, Imperial College, London, UK
[2]Infectious Disease Section, Imperial College, London, UK
[3]St Mary's Hospital, Imperial College Healthcare NHS Trust, London, UK
[4]Electronic Health Records Research, LSHTM, London, UK
[5]HPRU-AMR, Imperial College, London, UK
Contact: k.honeyford@imperial.ac.uk

Background:

This study investigated the impact of a digital sepsis alert on patient outcomes in a busy London multi-site hospital. Sepsis is a serious illness and common cause of death, but rapid diagnosis and treatment improve patient outcomes. Digital health records allow algorithms to be embedded which 'alert' clinicians to patients who are at risk of developing sepsis. Despite the current promotion of 'digital health', evidence of the impact of algorithm driven alerts on patient outcomes is limited.

Methods:

A retrospective natural experiment utilising the phased introduction of a digital sepsis alert into a large, multi-site hospital in England. Silent alerts (not visible to clinicians) acted as controls. Outcome measures were in-hospital all-cause mortality within 30 days of the alert, extended hospital stay ($\geq$7 days) and timely antibiotics ($\leq$60 minutes of the alert). Inversely weighted multivariable logistic regression was used to determine associations between alert and patient outcomes.

Results:

In a sample of 21,183 inpatients, the mortality rate was 5.9%. The active, visible alert was associated with lower odds of death (Odds Ratio (OR):0.76; 95%CI:(0.70, 0.84)). In 9988 emergency department attendances ending in admission, 40.6% had an extended hospital stay and 41.5% received timely antibiotics. The active alert was associated with lower odds of extended hospital stay (OR:0.93; 95%CI:(0.88, 0.99)) and increased odds of receiving timely antibiotics (OR:1.71; 95%CI:(1.57, 1.87)).

Conclusions:

This study demonstrates that a move to digital health, through an automated sepsis alert, embedded in digital health records, was associated with improved health outcomes. Further work is needed to identify the causal pathway, which is likely to include more rapid treatment with antibiotics, and possible unintended consequences. These findings support the ongoing roll out of digital alerting and provide a model for robustly evaluating their impact.

Key messages:

- The introduction of an automated sepsis alert associated with the use of improvement methodology was associated with improved process measures and patient outcomes.
- Introduction of digital health interventions can, and should, be robustly evaluated with appropriate statistical approaches.

An automated diagnostic device for children under 5 years of age: A proof-of-concept study in Malawi

Mohammad Shah

M Shah[1], *G Jenda*[2], *H Nsona*[3], *E Gigi*[4], *P Dadlani*[4], *E Swedberg*[1]
[1]Global Health, Save the Children US, Washington DC, USA
[2]Health and Nutrition, Save the Children, Lilongwe, Malawi
[3]IMCI Unit, Ministry of Health, Lilongwe, Malawi
[4]Technical Unit, Philips Research, Eindhoven, Netherlands
Contact: mshah@savechildren.org

Background:

Automated diagnostic device to measure child's vital sign is a global unmet demand. Having separate diagnostic devices to measure multiple vital signs is more expensive, and can be complex for health workers. An automated ''all-in-one'' device would help avoiding extra costs as well as maintenance challenges associated with multiple devices. In addition to improve classifying childhood illness, such an automated device would also increase adherence to guidelines, optimal use of antibiotics, and a reduction of unnecessary referrals.

Methods:

We studied an automated device in Malawi, which was designed to measure multiple key vital signs (SPO2, respiratory rate, temperature) among newborn, infant and children <5 years. The device collected photoplethysmogram (PPG) signals for SpO2 via a universal pediatric sensor, placed on child's finger. Temperature was measured via infra-red signal from child's forehead. Accelerometry measures respiratory rate, by placing the device around the child's belly. The CO2 sensor data together with video recordings of child's respiration offered the reference for child's respiration count.

Results:

Preliminary analyses of valid PPG signals, video annotated respiratory count and CO2 sensor data revealed the following key results:

- For SPO2, the performance of the target probe among 170 subjects appears extremely well with even the smallest and largest children.

- Among 145 subjects with valid CO2 data, 93 subjects were fully calm and had a regular breathing pattern. Comparing accelerometry measurements from 93 calm subjects with the reference data, the root of mean square error (RMSE) was only 1.18 respiration per minute (RPM). Excluding four outlier measurements from 145 subjects' dataset, the RMSE for the remaining 141 subjects was 1.76 RPM.

Conclusions:

This study results demonstrated the proof of concept that the device measures key vital signs among newborn, infants and children <5 years, using a reusable single-based probe.

Key messages:

- Automated diagnostic device measures key multiple key vital signs (SPO2, respiratory rate, temperature) among newborn, infant and children <5 years.
- Such an automated device may have potential to ensure accuracy in diagnosis, increasing adherence to recommended guidelines, optimizing use of antibiotics, and reducing unnecessary referrals.

Impact of deprivation on hospital efficiency and financial balance in paediatrics

Morgane Michel

M Michel[1,2,3], C Alberti[2,3,4], JC Carel[5,6], K Chevrel[1,2,3]

[6]NeuroDiderot, INSERM, Université de Paris, Paris, France

Contact: morgane.michel@urc-eco.fr

Background:

In healthcare systems where hospital tariffs are based on average national length of stay (LOS), deprived patients may be a source of inefficiency for hospitals as deprivation has been shown to be associated with increased LOS. They may also negatively impact hospitals' financial balance as few hospital payment methods include deprivation. Our objective was to study the impact of deprivation on hospital efficiency and financial balance.

Methods:

A study was carried out using an exhaustive national hospital discharge database. All inpatient stays in mainland France between 2012 and 2014 by children over 28 days and under 18 in hospitals with a paediatric ward were included. Deprivation was estimated with an ecological deprivation index divided into national quintiles. Efficiency was assessed by variations in patients' LOS compared to different mean national LOS (paediatric LOS, LOS of admissions for a similar condition...). Financial balance was assessed at the admission level through the ratio of production costs and revenues and at the hospital level with the difference between all revenues and production costs for said hospital. Multivariate models assessed the association between those indicators and deprivation.

Results:

4,124,510 inpatient stays were included. LOS was shorter than national means for less deprived patients and longer for the more deprived, and the difference was higher for diagnosis-related groups (DRGs) that included both adult and paediatric patients compared to paediatric-only DRGs. The multivariate model confirmed those significant associations. Deprivation also had a significant impact on hospitals' financial balance, especially for hospitals with a percentage of paediatric patients in the two most deprived quintiles between 20% and 60%.

Conclusions:

Measures to reform hospital payment methods must be encouraged to improve resource allocation efficiency and equity in access to good paediatric care.

Key messages:

- A reform of hospital funding to better account for deprivation is needed. A modulation of tariffs using an allocation key at the patient level must be considered to mitigate the effect of deprivation.
- DRGs specific to children should be encouraged to become the norm rather the exception to provide an adequate picture of resources used during admission and therefore an appropriate tariff.

The effect of an mhealth clinical decision-making support system on neonatal mortality in Ghana

Hannah Brown Amoakoh

Contact: ansomaame@hotmail.com

Background:

Mhealth interventions promise to bridge gaps in clinical care but documentation of their effectiveness is limited. We evaluated the utilization and effect of an mhealth clinical decision-making support intervention that aimed to improve neonatal mortality in Ghana by providing access to emergency neonatal protocols for frontline health workers.

Methods:

In the Eastern Region of Ghana, sixteen districts were randomized into two study arms (8 intervention and 8 control clusters) in a cluster-randomized controlled trial. Institutional neonatal mortality data were extracted from the District Health Information System-2 during an 18-month intervention period. We performed an intention-to-treat analysis and estimated the effect of the intervention on institutional neonatal mortality (primary outcome measure) using grouped binomial logistic regression with a random intercept per cluster. This trial is registered at ClinicalTrials.gov (NCT02468310).

Results:

There were 65,831 institutional deliveries and 348 institutional neonatal deaths during the study period. Overall, 47·3% of deliveries and 56·9% of neonatal deaths occurred in the intervention arm. During the intervention period, neonatal deaths increased from 4·5 to 6·4 deaths and, from 3·9 to 4·3 deaths per 1,000 deliveries in the intervention arm and control arm respectively. The odds of neonatal death was non-significantly higher in the intervention arm compared to the control arm (odds ratio 2·10; 95% CI (0·77;5·77); $p = 0·15$). The correlation between the number of protocol requests and the number of deliveries per intervention cluster was 0·71 ($p = 0·05$).

Conclusions:

Non-significant higher risk of neonatal death observed in intervention clusters may be due to problems with birth and death registration, unmeasured and unadjusted confounding, and unintended use of the intervention. The findings underpin the need for careful and rigorous evaluation of mhealth intervention implementation and effects.

Key messages:

- Supposedly effective interventions must be evaluated in context before they are scaled-up.
- Mechanisms influencing outcomes in context must be considered in the design and evaluation of interventions.

2.I. Workshop: Sharing best practices and building effective training at European points of entry

Organised by: Netherlands National Institute for Public Health and the Environment
Chair persons: Aura Timen - EUPHA (IDC), Christos Hadjichristodoulou - Greece
Contact: doret.de.rooij@rivm.nl

Infectious diseases can spread all over the world due to the transportation of people and goods through ships, aircrafts and vehicles. During the transportation on board of conveyances (ships, aircrafts, trains, buses), diseases can spread from person-to-person, by infected food or water or through vectors. The same can happen when travelers pass through points of entry (PoE) such as: ports, airports and ground-crossings.

To properly prevent and respond to public health events at PoE, designated ports, airports and ground-crossings core capacities for PoE are dictated in the IHR (2005), which should be in place at all designated PoE. According to the World Health Organization Global Health Observatory data, the IHR core capacities implementation at designated PoE at the European WHO region is 64%. In order to support countries with this implementation, exchange among countries of effective, legalized practices in accordance with IHR (2005), the so-called best practices, can be of important help.

Besides the goal to improve mere capacity, professionals in charge of communicable diseases at PoE should be prepared to respond to public health events and prevent cross-border spread. Education, training and exercises are common ways to achieve this, but demand extensive expertise, time and financial means. As part of a EU Joint Action, a collective training program for designated PoE is being developed, to share efforts and resources, and to help countries better respond to public health events.

However, regarding this training, many questions are still unanswered. What is effective training for public health events at designated PoE, and what components and methodology should it contain. What are the specific training needs of these people? What competencies should they have? What can we learn from previous trainings and what are best practices for designated PoE? The aim of this workshop is to provide a step-by-step overview of all elements that are essential to improve capacity and develop and organize effective training program for event management at designated points of entry in Europe.

This study was funded by the European Union's Health Programme (2014-2020).

Key messages:

- Extensive and long-term evaluation of training and exercising regarding infectious disease control at points of entry is needed, in order to design effective trainings and facilitate core capacities.
- Collection and dissemination of best practices in infectious disease control at points of entry, facilitate the challenging task of IHR core capacity implementation.

Effective training in cross-border infection prevention and response

Doret de Rooij

D de Rooij[1,2], E Belfroid[1], CM Swaan[1], J Raab[3], A Timen[1,2]
[1]National Coordination Center for Communicable Diseases, RIVM, Bilthoven, Netherlands
[2]Athena Institute, Free University, Amsterdam, Netherlands
[3]Tilburg School of Social and Behavioral Sciences, Tilburg University, Tilburg, Netherlands
Contact: doret.de.rooij@rivm.nl

Introduction:

Competent personnel at points of entry is important to prevent international spreading of disease. Education, training and exercises (ETE) are commonly used to secure this competency. We studied what effective training looks like, by conducting a literature review on effective ETE, conducting a training needs assessment.

Methodology:

A systematic search in Embase, Medline, Web of Science, ERIC, Cinahl, and PsycInfo, to identify effective ETE on infectious disease control was performed. We integratively analysed effectiveness of ETE methods on different outcome levels: satisfaction, learning, behavior and organizational performance. Also, we assessed training needs and -preferences among professionals involved in infectious disease control at points of entry in Europe. They completed a digital questionnaire about previously received ETE, importance of topics, highest training needs, and their preferred ETE methodologies.

Results:

We identified a range of effective ETEs in 62 studies. However, details on specific ETE methodologies are scarce, thwarting to link effectiveness to methodology. Also, long term and high level outcomes like behavioral change or public health system performance are reported less frequently than mere satisfaction or knowledge change, while these former often have higher relevance in real practice. Respondents (n = 59) had highest training needs concerning handling ill or exposed persons, and design and use of the contingency plan. Training needs correlated with importance of topics. Highest preferred training methods were presentations and e-modules.

Conclusions:

We call for more extensive evaluations of education, training and exercises in infectious disease control, with measurement of high level outcomes and long term effects. Results from the current review and training needs from the field could be combined to design most effective ETE at points of entry.

Public health events in the maritime transport sector

Varvara Mouchtouri

C Varela Martinez[1], C Hadjichristodoulou[2], B Mouchtouri[2]
[1]National Institute of Public Health, Instituto de Salud Carlos III, Madrid, Spain
[2]Department of Hygiene and Epidemiology, University of Thessaly, Thessaly, Greece
Contact: Mouchtourib@med.uth.gr

Introduction:

A literature review to describe evidence on communicable diseases affecting people on ships or at ports, from 1990 to 2013 was carried out. Also, a literature review on radiological and chemical events of public health relevance associated with ships or at ports, from 1940 to 2013 was performed.

Methodology:

Databases reviewed were: Medline, Scopus, Web of Science, Spanish Society of Maritime Medicine, and WebPages of WHO, The International Radio Medical Advice Centre, International Atomic Energy Agency, European Maritime Safety Agency, Marine Accident Investigation Branch, Spanish Nuclear Safety Council and the Major Accident Reporting System.

Results:

From 1990 to 2013, 196 outbreaks relating to ships or ports with more than 24,000 cases and 19 deaths were published. 59% of outbreaks (n = 116) were food- and waterborne, causing 82% (n = 19741) of cases and 12 deaths (11 deaths due to Legionella, case fatality ratio of 7%); almost a third was caused by norovirus. Respiratory diseases, mainly Influenza, caused 18% of outbreaks and 2 deaths. Thirteen radiological events were published that affected 500 persons and caused 47 deaths, 24 due to exposure to elevated levels of radiation. During the study period 94 chemical events were published, of which 69 events affected people and in the remaining events only a public health risk was present. These 69 chemical events generated almost 12,000 cases and more than 2,000 deaths. Thirty countries, including all EU Member States, Norway and Iceland, were requested to complete the questionnaires regarding identification of authorities and practices for management of radiological and chemical events.

Conclusions:

Food- and waterborne diseases are most reported; followed by respiratory diseases. Legionellosis accounted for the highest case fatality ratio. Tuberculosis was reported only on seafarers from cargo or fishing vessels and vaccine preventable diseases was mainly reported on crew members from cruise ships.

Best practices for core capacities at ports

Christos Hadjichristodoulou

C Hadjichristodoulou[1], *B Mouchtouri*[1]
[1]Department of Hygiene and Epidemiology, University of Thessaly, Thessaly, Greece
Contact: xhatzi@med.uth.gr

Introduction:

A survey was conducted in the frame of the EU HEALTHY GATEWAYS joint action with the purpose to identify best practices implemented at designated points of entry-ports of EU Member States for: core capacities implementation; detection, surveillance and management of public health events; vector surveillance and control practices at ports; contingency planning; risk communication; and inspection of ships for vectors.

Methodology:

A questionnaire was disseminated to the EU Member States designated partners of the joint action. ''Best practices'' were considered those which fulfilled the following four criteria: a) practices are implemented according to the International Health Regulations (2005) requirements for core capacities; b) practices are documented and legislated/formalised; c) staff have been trained in implementing the documented practices; d) practices have been tested with exercises or have been applied in real life events.

Results:

Data were collected from 15 ports of 13 countries including eight designated ports and one that that designation has not been completed. Best practices were described for medical services including diagnostic facilities, training programmes, exercise for testing contingency plans, staff competency frameworks, equipment and health measures implementation. Standard Operating Procedures and national legal frameworks were collected.

Conclusions:

Despite the progress that has been made in the IHR core capacities implementation, it seems that best practices exist based on the countries priorities and needs. There are not many examples of PoE implementing best practices in all areas of the survey. Achievement of core capacities is a continuing effort and exchange of best practices among EU MS can be beneficial.

Best practices and training for preparedness and response at airports

Jan Heidrich

J Heidrich[1], *J Angrén*[2], *D Schwarz*[2], *A Klahr*[2], *M Dirksen-Fischer*[3]
[1]Institute of Occupational and Maritime Medicine, University Medical Center Hamburg-Eppendorf, Hamburg-Eppendorf, Germany
[2]Unit for Preparedness and Crisis Management, Public Health Agency of Sweden, Stockholm, Sweden
[3]Hamburg Port Health Authority, Ministry of Health and Consumer Protection, Hamburg, Germany
Contact: jan.heidrich@bgv.hamburg.de

Introduction:

Airports are important points of entry (PoE). More than 2.5 billion passengers pass through Europe's airports every year. The nature of airports provides manifold opportunities for interactions among persons from all over the world and their environment with the potential for exposure, transmission and spread of infectious disease. Therefore, training, preparedness and response (P&R) to public health risks and events at airports are of utmost importance. The EU Joint Action Healthy Gateways airports branch (HGair) aims to strengthen P&R at airports in a multidisciplinary way.

Methods:

Based on the international health regulations (IHR) and on previous research, HGair investigates P&R using a multimethod approach and offers a variety of training activities. A survey to identify best practices on IHR core capacities, event detection, surveillance, management and contingency planning at airports is being carried out. Training methods include face-to-face trainings on European, national and local level, tabletop and simulation exercises as well as web-based training.

Results:

Main results of HGair are best practice catalogues, a tool for contingency plan development and assessment at airports, a depository of P&R training materials and table top/simulation exercises, standardized operation procedures for vector control at airports and for inspection of aircrafts for vectors, a web-based platform and network of experts to communicate and notify rapidly in case of cross-border risks to health at airports and in air travel. So far, completed questionnaires (n = 14) on best practices in P&R were received from designated airports in 13 European countries, showing variations in reported practices.

Conclusions:

European airports report different P&R practices. Deliverables and results of HGair provide the opportunity to strengthen IHR core capacities at airports and to harmonize surveillance and management of cross-border health threats in the air travel sector.

2.K. Workshop: Predictors and developmental timing of mental health problems among sexual minority individuals

Organised by: EUPHA (SGMH)
Chair persons: Corina Lelutiu-Weinberger - USA, Richard Bränström - EUPHA (SGMH)
Contact: arjan.van.der.star@ki.se

As consistently shown across studies from various parts of the world, sexual minority individuals (e.g., those identifying as lesbian, gay, and bisexual [LGB]) are significantly at a higher risk for depression, anxiety, and suicidal thoughts and behavior when compared to heterosexuals.

The increased risk for poor mental health among sexual minority populations is believed to be a consequence of LGB individuals' increased exposure to specific social stressors related to navigating a stigmatized minority identity. Studies trying to explain health inequalities based on sexual orientation have mainly focused on so-called minority stress processes, such as discrimination, internalized homophobia, expectations of rejection, and stress of concealing one's sexual orientation.

This workshop will give examples of studies from various European countries on mental health predictors and trajectories by using various approaches such as population-based sampling, longitudinal data collection, and comprehensive theoretical frameworks. Dr. Gemma Lewis (University College

London, UK) will present results showing that sexual orientation-based disparities in mental health are present already in early adolescence and increase throughout the school years. Arjan van der Star (Karolinska Institutet, Sweden) will present population-based data suggesting that openness about sexual orientation is not directly linked to lower risk of depression among sexual minorities, but is instead dependent on access to social support. Conor Mahon (Dublin City University, Ireland) will present results showing minority stressors as predictors of social anxiety among sexual minority men. Associate professor John Pachankis (Yale University, USA) will present results showing that, in addition to increased exposure to social stressors, barriers to societal integration can partially explain the elevated risk of suicidality among sexual minorities.

Key messages:

- Sexual minorities are a higher risk of mental health problems, such as depression, social anxiety, and suicidality, as compared to heterosexuals and these disparities can be identified early in life.
- Sexual orientation-based mental health disparities seem to be based both on disproportionate stigma-related stress and a higher prevalence of general risk factors for poor mental health.

Depression and self-harm from adolescence to young adulthood in sexual minorities compared with heterosexuals in the UK: a population-based cohort study

Gemma Lewis

M Irish[1], F Solmi[2], B Mars[3], M King[2], G Lewis[2], RM Pearson[3], A Pitman[2], S Rowe[2], R Srinivasan[2], G Lewis[2]
[1]Department of Psychological Medicine, King's College London, London, UK
[2]Division of Psychiatry, Faculty of Brain Sciences, University College London, London, UK
[3]Population Health Sciences, University of Bristol, Bristol, UK
Contact: gemma.lewis@ucl.ac.uk

Background:

There are few population-based cohort studies of the emergence, development, and persistence of mental health problems in sexual minorities compared with heterosexuals. We compared trajectories of depressive symptoms in sexual-minority adolescents and heterosexual adolescents from when they were aged 10 to 21 years, and examined self-harm at ages 16 and 21 years.

Methods:

The study included 4828 adolescents born between April 1, 1991, and Dec 31, 1992, from the Avon Longitudinal Study of Parents and Children birth cohort (Bristol, UK) who reported their sexual orientation when aged 16 years. Depressive symptoms were assessed with the short Mood and Feelings Questionnaire at seven timepoints between ages 10 and 21 years. A self-harm questionnaire was completed at ages 16 and 21 years. Analyses were linear multilevel models with growth curves (depressive symptoms), logistic multilevel models (self-harm in the previous year at ages 16 and 21 years), and multinomial regression (lifetime self-harm with and without suicidal intent at age 21 years).

Findings:

At age 10, depressive symptoms were higher in sexual minorities than in heterosexuals and increased with age to a larger extent. Depressive symptoms increased at each timepoint by 0·31 points in hetereosexuals, and by 0·49 points in sexual minorities. Sexual-minority adolescents were more likely than heterosexual adolescents to report self-harm in the previous year at ages 16 and 21 years, with no evidence that this estimate decreased with age. At aged 21, sexual minorities were more likely to report lifetime self-harm (ie, on at least one previous occasion) with suicidal intent than heterosexuals.

Interpretation:

Mental health disparities between heterosexuals and sexual minorities are present early in adolescence and increase throughout the school years, persisting to young adulthood. Prevention of these mental health problems and early intervention must be a priority.

Sexual orientation openness and depression symptoms: A population-based study

Arjan Van Der Star

A van der Star[1], JE Pachankis[2], R Bränström[1]
[1]Division of Psychology, Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
[2]Department of Social and Behavioral Sciences, Yale School of Public Health, New Haven, CT, USA
Contact: arjan.van.der.star@ki.se

Background:

Sexual minorities (e.g., lesbian, gay, and bisexual individuals) are at higher risk for depression than heterosexual individuals. Lack of openness about one's sexual orientation is a suggested source of these disparities, but it has been linked to both positive and negative mental health. Few population-based studies have explored the association between openness and depression, and potential mediators and moderators of this association, including social support and sexual orientation-based victimization.

Methods:

Swedish respondents to the 2014 wave of the European Health Interview Survey were used to identify a population-based sample of self-reported sexual minorities. All individuals reporting a nonheterosexual identity (and a matched sample of heterosexuals) were invited to participate in a follow-back study in 2016 (n = 320). A total of 191 (59.7%) individuals completed the survey, of whom 80 reported a gay, lesbian, bisexual, or other nonheterosexual identity.

Results:

This first nationally representative survey of sexual orientation openness showed that only about one third of the sample reported being completely open. We found no evidence of a direct association between openness and depression or a mediating effect of social support or victimization on this association. However, social support moderated this relationship, such that greater openness was linked to higher depression among sexual minorities reporting low levels of social support.

Conclusions:

Our study suggests that sexual orientation openness is not directly related to lower risk of depression among sexual minorities, but is instead dependent on access to social support. Sexual minorities might need social support for navigating the stress of open self-identification.

Minority stress, intra-minority stress and social anxiety: Examining an extended psychological mediation framework among sexual minority men

Conor Mahon

C Mahon[1], G Kiernan[1], P Gallagher[1]
[1]School of Nursing and Human Sciences, Dublin City University, Dublin, Ireland
Contact: conor.mahon24@mail.dcu.ie

Background:

Compared to their heterosexual counterparts, sexual minority men (SMM) are at an increased risk of social anxiety disorder. Distal (i.e., everyday discrimination) and proximal (i.e., internalised homophobia, rejection sensitivity, concealment of sexual orientation) minority stress processes are associated with heightened social anxiety for SMM. Stressors emerging from within the sexual minority male community, termed intra-minority stress, and psychological processes that may foster resilience (i.e., a sense of coherence, connectedness to the LGBT community) are less explored in this area. This study examined potential pathways between everyday discrimination, intra-minority stress, proximal minority stressors, resilience and social anxiety.

Methods:

Self-identified SMM (N = 255) residing in the Republic of Ireland completed an online survey containing measures of minority stress, intra-minority stress, resilience and social anxiety. Structural equation modelling was used to examine the model.

Results:

The model yielded a good fit to the data, X2(16) = 26.61, CFI = .99, TLI = .97, RMSEA = .05, and SRMR = .03. Rejection sensitivity and a sense of coherence had a significant indirect effect in the relationships between both exogenous variables (i.e., discrimination and intra-minority stress) and social anxiety. There were no significant pathways to social anxiety involving concealment of sexual orientation, internalised homophobia or LGBT community connectedness.

Conclusions:

For SMM, minority stress processes and intra-minority stress are important determinants of social anxiety. Our findings demonstrate that proximal minority stressors may operate differently in a social anxiety context for SMM in western European countries. A sense of coherence was an integral factor in the model and demonstrated the strongest association with social anxiety.

Untethered lives: Barriers to societal integration as predictors of the sexual orientation disparity in suicidality

John Pachankis

R Bränström[1], *A van der Star*[1], *JE Pachankis*[2]
[1]Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
[2]Department of Social and Behavioral Sciences, Yale School of Public Health, New Haven, CT, USA
Contact: john.pachankis@yale.edu

Background:

Despite increasing legal protections and supportive attitudes toward sexual minorities (e.g., those who identify as lesbian, gay, and bisexual [LGB]) in recent decades, suicidality remains more common among this population than among heterosexuals. While barriers to societal integration have been widely theorized as determinants of suicidality for the general population, they have not been comprehensively explored to explain the sexual orientation disparity in suicidality and/or compared to more established contributors.

Methods:

Data come from the cross-sectional Swedish National Public Health Survey, which randomly collected data from individuals (16-84 years of age) annually from 2010 to 2015 (1,281 (2.2%) self-identified as LGB). Analyses examined sexual orientation differences in suicidality (i.e., past-12-month ideation and attempts), and explored the role of barriers to societal integration (i.e., not living with a partner or children, unemployment, and lack of societal trust) in explaining this disparity over-and-above more commonly explored psychological (e.g., depression, substance use) and interpersonal (e.g., discrimination, victimization, lack of social support) suicidality risk factors.

Results:

Compared to heterosexuals, suicidal ideation and attempts were more common among both gay men/lesbians (AORideation: 2.51; AORattempts: 4.66), and bisexuals (AORideation: 3.76; AORattempts: 6.06). Barriers to societal integration mediated the association between sexual orientation and suicidality even in models adjusting for established risk factors for suicidality.

Conclusions:

The disproportionate barriers to societal integration that LGB individuals experience seem important contributors to the elevated risk of suicidality among sexual minorities. Preventive interventions should consider innovative ways to foster societal integration within sexual minority populations and to adjust hetero-centric social institutions to better include sexual minorities.

2.L. Determinants of frailty

Sex, age and socioeconomic inequalities in older people's unscheduled care

Kate Levin

K Levin[1], *E Crighton*[1]
[1]Public Health Directorate, NHS GGC, Glasgow, UK
Contact: katyannlevin@gmail.com

Background:

In Scotland, unscheduled care is usually received at hospital accident and emergency (A&E) departments or referral by GPs to medical assessment units (MAU). Almost a quarter attendances are for those aged 65 years+. Demand for unscheduled care will increase as the population ages. This study measures inequalities in unscheduled care presentations among those aged 65 years+.

Methods:

A&E and MAU attendance data between April 2017 and March 2018 for Glasgow residents were analysed. Data were modelled using poisson modelling for outcome measures attendances, rate of attendance and length of stay, adjusting for agegroup, sex and deprivation. A second set of models also adjusted for time of day, month and referral source, including interaction terms.

Results:

While there was a higher number of attendances among females (RR and 95% CI = 0.30 (0.28, 0.32)), and among those aged 65-69 years compared with older ages (RR = 0.03 (0.01, 0.06)), modelling rates showed that males were significantly more likely to attend (RR = 0.14 (0.13, 0.16)) and that likelihood rose with age, eg RR for 85+ years significantly greater than 80-84 years, significantly greater than for 75-79 years etc. There was no gender difference in length of stay but this increased with increasing age. Attendance was significantly more likely for those living in the most deprived quintile of deprivation (RR = 0.30 (0.27, 0.34) compared with the most affluent quintile). SES inequalities in attendance and length of stay became less pronounced with increasing age. Referrals via 999 emergency services increased with age while referrals by GP and NHS24 reduced with age. Attendance was more likely in December (RR = 0.15 (0.11, 0.18)) and likelihood of a morning attendance reduced significantly with increasing age and deprivation.

Conclusions:

Inequalities in attendance, length of stay and methods of referral are observed which should be considered when planning to meet the demand for unscheduled care.

Key messages:

- Age, sex and socioeconomic inequalities in unscheduled care exist even at the oldest ages.
- When planning to meet the demand of future unscheduled care, patterns of current use and population projections should be considered in tandem.

Influence of Physical Activity, Protein Intake and Social Network on the Frailty development

Sandra Haider

S Haider[1], *TE Dorner*[1], *I Grabovac*[1]
[1]Institute of Social Medicine, Centre for Public Health, Medical University of Vienna, Wien, Austria
Contact: sandra.a.haider@meduniwien.ac.at

Background:

Frailty, a geriatric syndrome, is associated with many adverse health outcomes. Risk factors include physical inactivity, low protein intake and an inadequate social network. In this analysis we aimed to assess the influence of these factors and their combination in an 11-year-follow-up study on a Europe-wide level.

Methods:

The analysed dataset included 22,226 community-dwelling robust and prefrail persons aged ≥50 years (11 countries) from the Study on Health, Ageing and Retirement in Europe (SHARE). Frailty was measured with the "Frailty Instrument for Primary care of the Survey of Health, Ageing and Retirement in Europe". Additionally, self-reported level of vigorous physical activity (PA), protein intake and satisfaction with social network were assessed. The impact of these parameters on the development of frailty was calculated using Cox regressions, adjusted for age, education, smoking, alcohol BMI, depression, long-term illness and each other.

Results:

People who do not engage in PA, had a higher HRs for frailty development compared to people performing PA regularly [women: 1.62 (95%CI: 1.22-2.13); men: 1.83 (95%CI: 1.44-2.33)]. People with low protein intake did not have significant higher HR [women: 1.05 (95%CI: 0.80-1.37); men: 1.16 (95%CI: 0.93-1.46)]. Women with poor social network showed HRs of 1.34 (95%CI: 1.24-2.15)], men with poor social network had a HR of 0.88 (95%CI: 0.70-1.10). In general, we found that persons with a combination of two risk factors had a higher risk for frailty compared to those with no or only one. However, no significant synergy index could be found.

Conclusions:

Regular PA, but also adequate social networks seem to be important factors in frailty prevention.

Key messages:

- Sufficient PA and satisfaction with social network were shown as modifiable factors to prevent frailty in an 11-year-follow-up study.
- A combination of two risk factors was associated with a higher risk for frailty compared to one, however, with no significant synergy index.

Risk of fall among the hospitalized over-49 population. A retrospective cohort study in a hospital

Francesco Gilardi

F Gilardi[1], T Mariani[2], G Liotta[1], M Musolino[3], E Caredda[1], L Morciano[1], C Giliberti[4], S Morbidelli[5], F Lucaroni[1]

[1]Department of Biomedicine and Preventio, University of Rome Tor Vergata, Rome, Italy

[2]Department of Prevention, Health Local Authority Latina, Latina, Italy

[3]Risk Management, Health Local Authority Rieti, Rieti, Italy

[4]Department of Prevention, Health Local Authority Roma 2, Rome, Italy

[5]Informative Systems, Health Local Authority Roma 2, Rome, Italy

Contact: francesco.gilardi@uniroma2.it

Background:

Despite the copious efforts made to prevent the problem, inpatient falls remain one of the most common adverse events in hospitals, with high risks in term of morbidity and mortality rates, as well as high costs for the healthcare system. This study aims to evaluate the inpatient falls incidence rate in a hospital in Rome, Italy.

Methods:

A retrospective cohort study has been set out based on data collected by a Risk Management Unit concerning the falls of patients over 49 years, which happened in the hospital between 1st July 2008 and 30th June 2013. Data collected from the incident report forms were inserted in a database and analyzed using the statistical program SPSS, 20.0 Illinois version.

Results:

During the period observed, 516 falls were reported. Patients who fell had a mean age of 68.8 years (SD ± 16.2). The falls are distributed for these age groups: 109 (21.1%) in 50-64; 129 (25%) in 65-74; 181 (35.1%) in 75-84; 97 (18.8%) in > 84. Fall incidence rate was calculated on the overall number of hospital admissions in the observed period (N = 35,812) (1.44 per 100 hospital admissions IC95% 1.32-1.56). Most of the patients were men (333; 64.5%) and older than 75 (53.9%). Inpatient falls were more frequent in the medicine wards (incidence rate 2.2 per 100 hospital admissions, IC95% 1.85-2.55,). The 51.6% of falls happened during the night shift. Severe outcome resulted in 13.6% of falls. Most of the falls (52.3%) happened within three days from the hospital admission. At multivariate analysis, a period of 2-3 days from hospital admission is the main risk factor to determine severe outcomes such as death or cranial trauma (p = 0.02; OR 2.87 IC95% 1.16-7.09).

Conclusions:

The study contributes to measure the phenomenon in older adults and age group 50-64, identifying a specific indicator to properly measure inpatient falls incidence rate in the elderly. The study gives indications on the main risk factors related to this adverse event and on prevention strategies.

Key messages:

- Falls in hospital is an important adverse event not only in the elderly.
- The first period of three days from the hospital admission constitutes the main risk factor for the falls.

The contribution of eHealth to improve fall and balance disorder care in the elderly

Luís Velez-Lapão

Andréa Gaspar[1,2], Luís Velez-Lapão[1]

[1]Global Health and Tropical Medicine, Instituto de Higiene e Medicina Tropical, Universidade NOVA de Lisboa, Lisbon, Portugal

[2]ENT, Hospital Beatriz Ângelo, Lisbon, Portugal

Contact: luisvlapao@gmail.com

Background:

The global ageing and consequent vulnerability for chronic multimorbidity, balance disturbances and falls represent a significant public health challenge that needs to be addressed. The use of Information Systems and Technologies to support eHealth services responding to balance disorders represents an opportunity to optimize health outcomes and insure autonomy support for older people.

Methods:

A systematic review was performed in accordance to the Preferred Reporting Items for Systematic Reviews and Meta-Analysis statement (PRISMA) to describe the contribution of eHealth to balance disorders care of older adults. The search was limited to English language journals and to reports that were published in the last 5 years related to use of eHealth in the context of balance and fall, restricted to the population older than 60 years of age without functional limitation by neurological disease.

Results:

From a total of 1005 unduplicated articles, only 12 articles complied with the eligibility criteria. It was found a growing interest on the research but it was not possible to effectively compare the results of the studies. This can be explained due to diversity of older population engaged on the studies, differences in follow-up times, lack of homogeneity of study methodology and use of different remote technologies, yet to reach maturity. It was observed a gap between investigation and actual clinical use that should be addressed.

Conclusions:

The use of eHealth in the context of older people with fall risk due balance disorders represents an opportunity to be explored, reaching the fragile and growing elderly population. The patient, caregiver and health human resources engagement and the homogeneity on research are necessary keys to allow clinical applicability and alignment with health policies.

Key messages:

- The use of eHealth in the context of older people with fall risk due balance disorders represents an opportunity to be explored, reaching the fragile and growing elderly population.
- Homogeneity on research is necessary to allow clinical applicability and alignment with health policies.

Traumatic brain injury as a risk factor for dementia

Elisabetta Mezzalira

E Mezzalira[1], *B Stopa*[1], *A Khawaja*[2], *S Izzy*[2], *W Gormley*[1]
[1]Computational Neuroscience Outcomes Center at Harvard, Brigham and Women's Hospital, Boston, USA
[2]Department of Neurology, Brigham and Women's Hospital, Boston, USA
Contact: emezzalira@bwh.harvard.edu

Introduction:

The Centers for Disease Control and Prevention (CDC) reports that there were 2.87 million cases of traumatic brain injury (TBI) in the United States in 2014, 69 million worldwide. Some studies suggest a connection between TBI and increased risk of dementia, but it remains unclear whether the risk increases with age and TBI severity. Given our aging population, it is essential to better characterize the link between TBI and dementia.

Methods:

We conducted a retrospective cohort study of two major academic medical centers for years 2000-2015. We identified all patients with TBI, aged 45 and older. Variables included age, TBI severity, pre-existing dementia, dementia diagnosed after TBI, years to dementia, and follow-up time. TBI severity was determined by head/neck AIS score, using ICD-PIC software. Mild TBI was defined as AIS 0-2, and Moderate/Severe as AIS 3-6. Analysis was done in R.v.3.0.1 software.

Results:

Overall, there were 14,199 patients with TBI, of which 9,938 (70%) were mild and 4,261 (30%) were moderate/severe. Mean age was 70.5 (±14.0). There were 1,422 cases (10%) of pre-existing dementia, and 850 (6%) cases of dementia diagnosed after TBI. The mean follow-up time was 1,129 (±1,474) days.

The 75-84 age group had the highest incidence of TBI (28%). When compared by age group and TBI severity, the proportion of moderate/severe TBI increased with increasing age. The proportion of pre-existing dementia increased with age, as expected. Notably, there is increased incidence of dementia after TBI in patients aged 65 and older (7-10%, $p < 0.001$). There was no observed effect of TBI severity on the risk of dementia after TBI.

Conclusions:

Our results indicate that TBI is a risk factor for the development of dementia, especially in patients aged 65 and older. Given the global public health burden of these two diseases it is critical to develop effective TBI primary prevention strategies.

Key messages:

- TBI is a risk factor for the development of dementia.
- Need for public health measures to mitigate the risk of TBI in the patient population 65 and older.

2.M. Obesity and diabetes: preventing disease

Body mass index and mortality in relation to age and follow-up of 30 years in large Austrian cohorts

Gabriele Nagel

G Nagel[1,2], *RS Peter*[1], *B Föger*[2], *H Concin*[2]
[1]Ulm University, Ulm, Germany
[2]Agency for Preventive and Social Medicine (aks), Bregenz, Austria
Contact: gabriele.nagel@uni-ulm.de

Background:

Obesity and its health consequences will dominate health care systems in many countries during the next decades. Prevention programs have been implemented. However, the optimum body mass index (BMI) in relation to all-cause mortality on population level is still a matter of debate.

Material and Method:

Data 1/1989-6/2005 of the Vorarlberg Health Monitoring & Prevention Program (VHM&PP,) and 8/2005-12/2015 for Vorarlberg provided by the Main Association of Austrian Social Security Institutions were analyzed. In both cohorts, information was available on age, sex, measured height and weight as well as the date and cause of death. Generalized additive models were used to model the mortality rate as function of calendar time, age and follow-up.

Results:

The VHM&PP cohort consisted of 85,488 men and 99,873 women and the later of 129,817 men and 152,399 women. In the second cohort, men (mean age 48 (SD16.9) vs. 45.3 (SD 15.5) and women (48.3 (SD 17.7) vs. 45.6 (SD 16.6) years) were slightly older than in the VHM&PP cohort. The average BMI was slightly higher in men (26.1 (SD4.0) vs. 25.7 (SD3.8) kg/m2) but not in women (24.6 (SD 4.8) vs. 24.7 (SD 4.9) kg/m2), respectively. In the VHM&PP cohort more ever smokers were found in both men (40.3 vs. 22.4%) and women (24.8 vs. 18.4%) than in the subsequent cohort.

BMI optimum increased slightly between 1985 and 2015, from 24.9 (95%-CI: 24.0-25.9) to 26.4 (25.3-27.3) in men and from 22.4 (21.8-23.1) to 23.3 (22.5-24.5) kg/m2 in women. However, age and follow-up had major impact on the increase. In younger age the associations are quite stable, while in men over 50 years and in women over 60 years the BMI optimum decreased with length of follow-up.

Conclusions:

Overall the BMI optimum increased slightly over time. However, age and follow-up had major impact on the association. These results suggest, that prognosis of obesity related diseases has improved over time. To detangle this further research is necessary.

Key messages:

- In Austria the BMI optimum increased slightly over time.
- Age and follow-up time had major impact on the association.

Association between psychosocial stress and obesity among migrant and non-migrant Ghanaians

Charles Agyemang

C Baratin[1], *E Beune*[1], *D van Schalkwijk*[2], *C Agyemang*[1]
[1]Department of Public Health, Amsterdam UMC, Amsterdam, Netherlands
[2]Amsterdam University College, Amsterdam, Netherlands
Contact: c.o.agyemang@amc.uva.nl

Background:

Psychosocial stress is associated with obesity in some populations, but it is unclear whether the association is related to migration.

Aim:

This study explored associations between psychosocial stress and obesity among Ghanaian migrants in Europe and non-migrant Ghanaians in Ghana.

Methods:

Cross-sectional data from the RODAM study were used, including 5898 Ghanaians residing in Germany, the UK, the Netherlands, rural Ghana, and urban Ghana. Perceived discrimination, negative life events and stress at work or at home were examined in relation to body mass index (BMI) and waist circumference (WC). Linear regression analyses were performed separately for migrants and non-migrants stratified by sex.

Results:

Perceived discrimination was not associated with BMI and WC in both migrants and non-migrants. However, negative life events were positively associated with BMI ($\beta = 0.78$, 95% CI, 0.34 to 1.22) and WC ($\beta = 1.96$, 95% CI, 0.79 to 3.12) among male Ghanaian migrants. Among non-migrant Ghanaians, in contrast, stress at work or at home was inversely associated with BMI and WC in both males (β = -0.66, 95% CI, -1.03 to -0.28; β = -1.71 95% CI, -2.69 to -0.73, respectively) and females (β = -0.81, 95% CI, -1.20 to -0.42; β = -1.46, 95% CI, -2.30 to -0.61, respectively).

Conclusions:

Negative life events are associated with increased body weight among Ghanaians in European settings, whereas stress at work or at home is associated with reduced body weight among Ghanaians in Ghana. More work is needed to understand the underlying factors driving these differential associations in order to assist prevention efforts.

Key messages:

- Negative life events are associated with increased body weight among Ghanaians in European settings, whereas stress at work or at home is associated with reduced body weight among Ghanaians in Ghana.
- More work is needed to understand the underlying factors driving these differential associations in order to assist prevention efforts.

A National Digital Diabetes Prevention Programme: Feasible, acceptable and effective?

Elizabeth Murray

E Murray[1], J Valabhji[2,3], A Lavida[1], W Henley[4], K Daff[5], J Irwin[5], L Brownlee[5], B McGough[6]

[1]Primary Care and Population Health, University College London, London, UK

[2]Medical Directorate, NHS England, London, UK

[3]Diabetes and Endocrinology, Imperial College Healthcare Trust, London, UK

[4]Institute of Health Research, University of Exeter Medical School, Exeter, UK

[5]RSM UK Consulting LLP, London, UK

[6]Public Health England, London, UK

Contact: elizabeth.murray@ucl.ac.uk

Background:

Type 2 Diabetes (T2DM) is a global public health priority affecting 425 million adults with 352 million more at risk of developing T2DM. Intensive group programmes focusing on weight loss and physical activity can prevent or postpone the development of T2DM, but certain groups (e.g working age) find it difficult to attend sessions. Digital options offer a flexible alternative with the potential to widen access and increase uptake. The National Health Service of England (NHSE) has initiated a pilot of a national digital Diabetes Prevention Programme (DPP) to determine its feasibility, acceptability and impact. This is the first national digital DPP in the world, and lessons learnt will be of interest internationally.

Methods:

Single arm, pre-post design located in 9 geographic areas with a total population of 5.6 million adults. Adults identified in primary care as being at risk of T2DM were referred to a digital diabetes prevention intervention (DDPI). Baseline data included demographic details (age, gender, ethnicity, highest level of education achieved) and clinical data (weight (kg), Body Mass Index (BMI) and glycated haemoglobin (HbA1c mmol/mol)). Clinical data were collected at baseline, 6 and 12 months, with the primary outcome change in HbA1c at 12 months.

Results:

The programme was effectively implemented in all 9 areas with a total of 5,053 referrals. 3,228 (64%) of those referred registered with a DDPI. Mean baseline values for registered patients was BMI 31.1, Weight 87.7 kg and HbA1c 43.4 mmol/mol. To date, 2,687 patients have reached the 6 month point, of whom 867 dropped out. Mean (95% CI) HbA1c change was -1.6 (-1.8 to -1.4) mmol/mol (n = 1,264) and mean (95% CI) weight change was -4 (-4.3 to -3.7) kg (n = 1,184).

Conclusions:

A national digital DPP is feasible, acceptable to patients and healthcare providers, and appears to be associated with beneficial impacts on HbA1c and weight in those who participate.

Key messages:

- A digital DPP is feasible, acceptable and associated with reductions in weight and HbA1c amongst participants.
- A digital DPP could be a useful part of a public health strategy to combat T2DM.

Association between detection of non-diabetic hyperglycaemia and vascular complications

Raffaele Palladino

R Palladino[1,2,3], AG Tabak[4,5], K Khunti[7], J Valabhji[6], A Majeed[1], C Millett[3,1], EP Vamos[3,1]

[1]Department of Primary Care and Public Health, Imperial College, London, UK

[2]Department of Public Health, University, Naples, Italy

[3]Public Health Policy Evaluation Unit, Imperial College, London, UK

[4]Department of Epidemiology and Public Health, University College of London, London, UK

[5]1st Department of Medicine, Semmelweis University Faculty of Medicine, Budapest, Hungary

[6]NHS England London, NHS, London, UK

[7]Diabetes Research Centre, University of Leicester, Leicester, UK

Contact: palladino.raffaele@gmail.com

Background:

The benefit of screening for non-diabetic hyperglycaemia (NDH) is still debated. Furthermore, the associated risk of vascular complications following a diagnosis of Type 2 diabetes (T2D) in people previously detected as NDH in real-world settings is not known. We examined the presence of vascular disease in newly diagnosed T2D individuals by glycaemic status within 3 years of diagnosis.

Methods:

We identified 159,736 individuals diagnosed with T2D from the Clinical Practice Research Database in England between 2004 and 2017. We used logistic regression models to compare presence of microvascular (retinopathy and nephropathy) and macrovascular (coronary artery events, cerebrovascular and peripheral arterial disease) disease at the time of T2D diagnosis by prior glycaemic status. Models were adjusted for age, sex, ethnicity, deprivation, smoking status, blood pressure, cholesterol, and number of primary care visits.

Results:

There was a strong association between baseline glycaemic status and presence of microvascular complications at diabetes diagnosis (normoglycaemia 30.7%, no glycaemic test 36.7%, NDH 42.4%). Similarly, prevalence of macrovascular disease was lower for those with normoglycaemia(26.9%) compared with NDH(29.8%). Compared with individuals with normoglycaemia, those detected with NDH before the diagnosis of T2D had 76% and 53% increased odds of retinopathy and any microvascular complications (AOR 1.76, 95%CI 1.69-1.85; AOR 1.53, 95%CI 1.41-1.65), and 7% higher odds of diagnosis of acute coronary events (OR 1.07, 95%CI 1.03-1.12) at time of diagnosis of T2D.

Conclusions:

Microvascular and macrovascular diseases are detected in 40 and 20% of newly diagnosed T2D. NDH before the diagnosis of T2D was more likely associated with microvascular complications and acute coronary events. Detection of NDH might represent opportunities for reducing the burden of microvascular disease through heightened attention to screening for microvascular complications.

Key messages:

- Detection of non-diabetic hyperglycaemia before the diagnosis of Type 2 diabetes was more likely associated with microvascular complications and acute coronary events.
- Detection of non-diabetic hyperglycaemia might represent opportunities for reducing the burden of microvascular disease through heightened attention to screening for microvascular complications.

2.N. Skills building seminar: How to Advocate Scientific Evidence to Decision-makers?

2.N. How to Advocate Scientific Evidence to Decision-makers?

Organised by: EUPHAnxt, Global Health Next Generation Network, EUPHA (PHPP)
Chair persons: Viveka Guzman - Ireland, Keitly Mensah - France
Contact: anton.karl.hasselgren@gmail.com

Public health research aims to change the world, or at least contribute to the development of healthier and more equitable societies. However, the availability of health information does not inherently lead to its increased use in policy and decision-making. Significant gap remains between the knowledge of public health researchers and the actions taken by decision-makers. Various tools and mechanisms can help to increase the use of scientific evidence in policy development by making policymakers appreciate, understand and incorporate such scientific information into policy decisions. As part of this process, it is crucial that researchers and public health practitioners acquire the ability to translate their knowledge and become skilled on communicating the evidence effectively.

To this aim, we will present firstly a WHO approach for that on the basis of EVIPNet Europe. Member countries have benefited of EVIPNet Europe's capacity building efforts, its training workshops, coaching and mentoring schemes, leading to increased knowledge and skills in view of identifying, accessing, appraising, synthesizing and communicating the best available evidence. The presentation will focus on the ways to trigger tangible changes at policy and legislative levels.

The second presentation will give more specific information about the process of real-life applications. Main question will be ''How to advocate scientific evidence to decision-makers in the frame of evidence-informed policy-making?''. The presentation will help the participants to analyze to whom they are targeting, what their interests are and how to communicate scientific information to a decision-maker effectively.

Last but not least, common challenges of evidence-informed policy-making process in health care and ways to tackle them will be presented. By doing so, special attention will be paid to the methodologies for joint fact-finding, responsive evaluation and citizen science.

The workshop will engage participants interactively and leave time for answering their questions at the end.

Key messages:

- Public health professionals can influence health policies, if they learn strategies in communicating scientific evidence to decision-makers effectively.
- Providing correct skills to researchers when communicating about and advocating for the scientific evidence with policy-makers will enhance the impact of evidence on policy making.

WHO Approach

Tanja Kuchenmueller

T Kuchenmueller[1]
[1]Knowledge Management, Evidence & Research for Policy-Making, WHO Europe, Copenhagen, Denmark
Contact: kuchenmullert@who.int

Despite considerable investments into the generation of research worldwide, research is frequently not used in practice or policy. A substantial body of evidence is showing that using research requires significant and planned change at individual, organizational and systems levels.

To support and guide WHO Member States in the endeavor of strengthening evidence-informed policy-making, the WHO Regional Office for Europe launched the Evidence-informed Policy Network (EVIPNet) Europe at the end of 2012. It is a capacity building initiative that aims to create, train, guide and institutionalize innovative, multisectoral and multidisciplinary partnerships and teams at the country level. Assisted by EVIPNet Europe, these teams initiate and implement national research-to-policy processes, such as developing user-friendly evidence briefs for policy on high-priority policy issues targeted and tailored to policy-makers, holding policy dialogues, and creating linkages and exchange between the research and policy communities.

In this presentation, an overview of EVIPNet Europe's mandate, approaches, tools and activities will be given. Participants will gain an understanding of how knowledge brokering and integrated, interactive mechanisms can help to bridge the gap between research and policy and improve health outcomes.

Strategies and practical examples

Tugce Schmitt

T Schmitt[1]
[1]Global Health Next Generation Network, Brussels, Belgium
Contact: info@schmitt-t.com

Various tools and mechanisms can help to increase the use of scientific evidence in policy development by making policy-makers appreciate, understand and incorporate such scientific information into policy decisions. As part of this process, it is crucial that researchers and public health practitioners acquire the ability to translate their knowledge and become skilled on communicating the evidence effectively.

The European Observatory on Health Systems and Policies supports and promotes evidence-based health policy-making through comprehensive and rigorous analysis of the dynamics of health-care systems in Europe. It engages directly with policy-makers and experts, and works in partnership with research centers, governments and international organizations to analyze health systems and policy trends.

In this presentation, concrete strategies will be given for advocating scientific evidence. The focus will lie particularly on the process of real-life applications of evidence-informed policy-making. By this way, it will help the participants to analyze to whom they are targeting, what are their interests and how to communicate scientific information to a decision-maker effectively based on specific examples from the European Observatory on Health Systems and Policies.

Tackling the challenges

Marleen Bekker

M Bekker[1]
[1]Department of Communication, Technology and Philosophy, Wageningen University & Research, Wageningen, Netherlands
Contact: marleen.bekker@wur.nl

In this presentation, information about common challenges of evidence-informed policy-making process in health care and ways to tackle them will be given to the participants. By doing so, special attention will be paid to the methodologies for joint fact-finding, responsive evaluation and citizen science.

2.O. Workshop: Climate change and the impact on public and occupational health

Organised by: Academic Collaborative Centre Environment and Health
Chair persons: Peter Van Den Hazel - EUPHA (ENV), Moniek Zuurbier - Netherlands
Contact: Peter.van.den.Hazel@vggm.nl

Objectives:

Climate change has an impact on people's physical, mental, and community health. This impact can arise directly and indirectly. Some natural disasters are exacerbated by climate change, like floods, heat waves, storms, wildfires, and landslides. Some effects occur more gradually for example from changing temperatures. Heat waves can weaken the infrastructure (transport, construction) and make food systems less secure (infections, less access). But heat waves can also directly cause severe health effects. Heat waves are examples of direct and indirect climate impacts on society's physical and mental health. Climate change creates visible impacts in many countries. The number of heat waves increased across the globe the last few decades. This change has an impact on communities' health both in private life settings as in occupational settings. There is an overlap of impact which influences the effects seen in both settings. The awareness of this overlap is not clear for most stakeholders. Health advisories before, during and after heat waves do not consider this issues in their health promotion activities.

This workshop aims at describing different ways how public health could benefit of a more integrative approach of health promotion by linking messages directed at the general public and the occupational work force. Therefore, examples on national as well as regional and local level are presented discussed with specific emphasis on requirements and processes for success on one hand and obstacles on the other. The examples reflect different European regions and country heat waves plans as well as results from the EU-funded projects HEATSHIELD and SCORCH.

Key messages:

- Heat will be an increasing issue in public health.
- Health advisories need to be improved during periods of heat.

Occupational health effects during periods with heat

Moniek Zuurbier

P van den Hazel[1], M Zuurbier[1], A Flouris[2,3], L Nybo[4], B Kingma[5]

Hydration status, awareness and the attitude to health and performance effects of preventing dehydration was evaluated in five industries across Europe. The prevalence of dehydration was assessed via analyses of urine samples from 139 workers and questionnaires collected from employers as well as employees collected from ten different work places. In total 80 % of all workers were either suboptimal hydrated at the onset of work or became dehydrated during their work shift with levels equal to or higher than those associated with impaired function in cognitively dominated tasks and complex motor function. The high prevalence of dehydration is in conflict with ~75% of all workers that emphasize drinking as the most important mitigation strategy during periods with elevated heat strain. Also, work safety and prevention of negative health effect was stressed as very important both by employers and employees (average score 9 out of 10). Although, hydration is emphasized by work-safety advisories, it seems clear that more effective 24/7 hydration strategies are warranted. We propose that future protection of workers against detrimental effects of heat should consider personalized alerts that can integrate the importance of timing to facilitate the development of appropriate hydration habits that accounts for the large inter-individual variation in sweating and hence differences in water and electrolyte needs.

Preventing heat stroke and heat illness on the workplace: a study on knowledge, attitudes and practices of safety representatives from Northern Italy (2016-2017)

Matteo Riccò

M Ricco[1], L Vezzosi[1], F Balzarini[1], A Giosuè Mezzoiuso[1]
[1]Dipartimento di Sanità Pubblica, AUSL – IRCCS di Reggio Emilia, Reggio Emilia, Italy
Contact: mricco2000@gmail.com

Introduction:

Heatwaves (HWs) and rising environmental temperatures are significant health threats also for workplaces. This study will investigate knowledge, attitude and practices towards heat-related health issues in a sample of safety representatives from Northern Italy (SRs).

Methods:

A cross-sectional questionnaire survey was conducted in 2016-2017 among 327 SRs. Knowledge status was measured both in general and focusing on first-aid issues. Assessment of risk perception included severity and frequency of heat-related events. Multivariate logistic regression analysis assessed individual and work-related characteristics associated with SRs' risk perception.

Results:

258 questionnaires were retrieved (participation rate 78.9%; mean age 48.2±25.2 years). Knowledge status was relatively good on technical/preventive issues (62.3%%±16.8) and first aid measures (67.1%±25.2), but a large share of respondents ignored the risk from exertional heat stroke (35.7%), and for heat strokes elicited by non-environmental heat (e.g. machineries, use of protective equipment, etc. 47.7%). The majority of respondents acknowledged the high frequency of HW events (90.7%), but only 44.6% agreed on their potential health threat. had received A specific first-aid formation was reported by 49.2% of respondents, while 10.9% had any previous interaction with heat-related disorders. Specific countermeasures had been put in place by parent company in 3.9% of cases. Eventually, previous participation to formation courses was associated with higher risk perception regarding severity and frequency of HW (OR 3.18 95%CI 1.40-7.23, OR 5.54 95%CI 1.59-19.23 respectively), while previous interaction with heat-related disorders apparently raised the perceived severity of heat-related health risk (OR 3.92 95%I 1.10-13.14).

Conclusions:

Although SRs exhibited a fairly good understanding of heat-related health issues on the workplaces, our findings also suggest the need to enforce specific countermeasures.

The role of youth in the climate change debate

Peter Van Den Hazel

P Van Den Hazel[1]
[1]Environment and Health, VGGM, Arnhem, Netherlands
Contact: Peter.van.den.Hazel@vggm.nl

The impacts of climate change are not distributed equally. Some people will experience natural disasters first hand, some will be affected more gradually over time, and some will experience only indirect impacts. There are data from the United nations that show the interest of youth on climate change. Close to half a million youth around the world have taken action on climate change through SGP [small grants programmes] projects in their homes, schools and communities. (UNDP, 2015). 84% of the surveyed young people agree that they need more information to prevent climate change. (UNEP, 2011). Furthermore, about 73% of surveyed youth say they currently feel the effects climate change. (UNEP, GlobeScan Survey, 2008). Some 89% of youth respondents say young people can make a difference on climate change. [UNEP, 2008]. But only 9% of youth are very confident the world will act quickly enough to address climate change. [UNEP, 2008]. Young people are key actors in raising awareness, running educational programmes, promoting sustainable lifestyles, conserving nature, supporting renewable energy, adopting environmentally-friendly practices and implementing adaptation and mitigation projects[UNFCCC]. Action by youth, as protest school strikes or speeches to the UN by Greta Thunberg, urge immediate action from governments, business leaders and school leaders. There are different reasons for this action by youth. The psycho-social impacts of a changing climate are generally under lighted in these reasons. Are the responses by society enough to minimize suffering and promote resilience of youth in the face of the challenging impacts of climate change? Or do governments and businesses enough while they increasingly seem to be moving toward action on climate change, as they proclaim to cut their own emissions or be active in their energy transition? It is not clear whether those actions are enough to satisfy the next generation of customers, employees and decision makers.

The health impact of heat waves in Europe: insights from national plans and key informant interviews

Kirsten Vanderplanken

K Vanderplanken[1], J van Loenhout[1], P van den Hazel[2]
[1]CRED, University of Louvain, Brussel, Belgium
[2]Environment and Health, INCHES, Ellecom, Netherlands
Contact: kirsten.vanderplanken@uclouvain.be

In Europe, heat waves and extreme heat are known to cause an increase in morbidity and mortality. Moreover, climate change is expected to increase the number and intensity of heat waves, particularly in urban areas. In order to limit the negative health impact of heat waves, many European countries have developed heat health plans.

The SCORCH project has reviewed the national heat plans of 20 European countries. In addition, face-to-face interviews were conducted in 9 countries, involving key stakeholders who partake in the development, implementation and/or diffusion of the plans.

Combined, the national plans and interviews provide insights in the different types of warning systems, the scales of implementation, the stakeholders involved and their responsibilities and the vulnerable populations that are targeted. Moreover, we are able to evaluate the processes outlined in the national plans, and identify certain strengths and weaknesses. These results will support the development of heat wave plans for countries that currently do not have such plans yet.

2.P. Population health metrics and innovative data sources

Slowing improvements in life expectancy across European Economic Area countries

John Ford

[11]Chief Knowledge Officer, Public Health England, London, UK
Contact: jf653@medschl.cam.ac.uk

Background:

Life expectancy improvements have slowed down in several European countries since around 2011. The relative contributions from changes in specific conditions (e.g. cancers) and broader risk factors (e.g. smoking or austerity) remain unclear. We aimed to explore the different potential causes in 17 European Economic Area (EEA) countries.

Methods:

We compared Global Burden of Disease (GBD) study estimates for life expectancy, years of life lost (YLLs) and population attributable fractions (PAFs) for risk factors, for 2005-2011 and 2011-2017 for 17 EEA countries. Three countries with the largest absolute improvements and three with the smallest were selected for analysis by gender, age, condition and risk factors.

Results:

Norway, France and Belgium had the largest improvement in life expectancy (+1.5, +1.2 and +1.2 years respectively) from 2011 to 2017, and Germany, Iceland and the UK the smallest (+0.1, +0.2 and +0.2 years). Life expectancy reduced slightly for women aged over 80 in Germany and UK, men aged over 50 in Germany, and for men in all age groups up to 90 years in Iceland. Norway, France and Belgium saw faster improvements in YLLs from lung cancer and Norway and France for COPD in both men and women, and from self-harm in men, after 2011 than before. PAF for tobacco declined faster after 2011. Germany, Iceland and the UK saw slower improvements in cardiovascular disease and in Germany and the UK lung cancer. In Iceland, YLLs for cancers, self harm, respiratory disease, cirrhosis and dementia all worsened after 2011. PAF for tobacco remained high or declined less after 2011 in all 3 countries. PAFs for alcohol and drug use remained high in Iceland and UK.

Conclusions:

Differential changes in major fatal diseases and risk factors help explain national changes in life expectancies, but national differences in data availability may affect results. Further research is needed into the 'causes of the causes', such as the 2008 economic crash in Iceland.

Key messages:

- Differential changes in major fatal diseases and risk factors help explain national changes in life expectancies.
- Norway, France and Belgium had the largest improvement in life expectancy from 2011 to 2017, and Germany, Iceland and the UK the smallest.

Disease burden in the Nordic region. Results from the Global Burden of Disease Study 2017 (GBD 2017)

Ann Kristin Knudsen

A Knudsen[1]*, GBD 2017 Nordic Collaborators*[2]
[1]Centre for Disease Burden, Norwegian Institute of Public Health, Bergen, Norway
[2]IHME, The Global Burden of Disease, Seattle, USA
Contact: ann.kristin.knudsen@fhi.no

Background:

The Nordic countries - Norway, Sweden, Finland, Iceland, Denmark - combine liberal and open-market economies with public welfare and universal health services. As separate countries with differences in culture and lifestyle, important health differences may exist between them. The aim of this study was to compare life expectancy and disease burden by causes and risk factors in the Nordic countries, including Greenland as constituent country under Denmark.

Methods:

Age-standardised overall, cause-, and risk factor-specific estimates of disability-adjusted life-years (DALYs), along with life expectancy, were analysed in the Global Burden of Diseases, Injuries and Risk Factors Study 2017 (GBD 2017). Sex and country specific estimates were compared with Nordic regional estimates.

Results:

Males and females in Denmark (males: 78.8 years, 95% uncertainty interval 78.1-79.5; females: 82.7 years, 81.9-83.4), and males in Finland (78.6 years, 77.8-79.2) had lower life expectancy than the other countries. The lowest life expectancy and highest DALY rates were found among males and females in Greenland. Variation in DALY rates between the countries was primarily due to differences in mortality-related causes, including ischaemic heart disease, chronic obstructive pulmonary disease, lung cancer, alcohol use disorder, and self-harm. These causes dominated male DALYs. There was little country-wise variation in DALYs due to non-fatal diseases, which were dominant causes among females. Smoking and metabolic risk factors were important risk factors across countries, but contributed most to DALYs among males and females in Denmark, and males in Finland (alcohol use only).

Conclusions:

The GBD framework facilitates within-region comparisons for benchmarking exercises and can guide policy development. The comparison of disease burden in the Nordic countries illustrates how differences in risk factors may drive life expectancy and disease burden differences in high-income settings.

Key messages:

- Diseases and injuries associated with mortality are important causes of disease burden among males, while non-fatal diseases dominates disease burden among females in the Nordic region.
- Risk factors differences may drive disease burden differences between the Nordic countries.

People with a disability status in the French claim database: which characteristics and diseases?

Antoine Rachas

N Colinot[1]*, M Thomas*[1]*, D Verboux*[1]*, A Rachas*[1]*, Ch Gastaldi-Ménager*[1]
[1]Department of Studies on Diseases and Patients, Caisse Nationale de l'Assurance Maladie, Paris, France
Contact: antoine.rachas@assurance-maladie.fr

Background:

Due to a lack of data, populations with disabilities have been poorly studied. Here, we described the characteristics and diseases of people receiving a financial support for a disability and compared them to the general population.

Methods:

We extracted data of all health insurance general scheme beneficiaries (87% of the French population) 20-64 years of age in 2016 from the national health database, including information on adult disability allowance (ADA) and disability pension (DP). Diseases were identified using algorithms mainly based on ICD-10 diagnoses from hospital stays, long-term diseases information and specific medications. The proportion of patients with a given disease was compared between people with ADA or DP or without a disability status using relative risks adjusted for age and sex (aRR), estimated by Poisson regression.

Results:

Among 32.5 million people, 770,566 (2.5%) had an ADA (mean age 47, 49% women) and 733,599 (2.4%) a DP (mean age 53, 55% women). Disability status was associated with a higher proportion for all studied diseases, with high aRR found for mental illness (ADA: 44.8% (aRR: 17); DP: 26.5% (aRR: 8.9) versus 2.5% in those without disability status), in particular mental retardation (aRR: 108 and 4.7 respectively), neurologic or degenerative diseases (ADA: 13.5% (aRR: 16); DP: 9.0% (aRR: 9.8) versus 0.8% in those without disability status), in particular paraplegia (aRR: 36 and 25), but also cancers, diabetes and chronic and acute cardiovascular diseases.

Conclusions:

About 5% of French health insurance beneficiaries 20-64 years old received a financial support for a disability in 2016. All studied diseases were more frequent in this population than in those without a disability status. These results are useful to inform public authorities on health status of these populations and to implement public health policies targeting these populations with special healthcare needs.

Key messages:

- High frequency of diseases, including mental illness and neurodegenerative diseases, but also a large panel of other diseases was observed in people with a financial support for a disability.
- Public health policies targeting people with a disability should account for the large spectrum of diseases in these patients.

Compared to whom? Reference groups in socio-economic comparisons and self-reported health

Alexi Gugushvili

A Gugushvili[1]*, E Jarosz*[2]*, M McKee*[3]
[1]Department of Social Policy and Intervention, University of Oxford, Oxford, UK
[2]Institute of Education, University College London, London, UK
[3]LSHTM, University of London, London, UK
Contact: alexi.gugushvili@spi.ox.ac.uk

Background:

The association between socio-economic position and health is believed to be mediated, in part, by psycho-social comparison of one's situation to that of others. But with who? Possibilities include family, friends, elites, or even those in other countries or in previous times. So far, there has been almost no research on whether the reference point matters.

Methods:

We take advantage of a comparative data set that, uniquely, allows us to ask this question. The Life in Transition Survey was conducted in four Southern European and 30 Central and Eastern European and Eurasian countries. We sought differences in the probability of good self-reported health among those using different reference groups, including own family, friends and neighbours, domestic elites, people living in other countries and, those living prior to the major politico-economic transition. We used multivariable and multilevel mixed-effects Poisson regressions and estimated treatment effects via the regression adjustment of Poisson models.

Results:

In most cases the choice of reference group did not matter but in some it did. Among men in Eastern European and Eurasian societies, those who compared themselves to their parents and their own families before the start of transition were less likely to report good health compared to those who did not compare their own economic situation with any specific reference group.

Conclusions:

For some individuals, the choice of who to compare one's situation with does seem to matter, pointing to an area for future investigation in research on psycho-social determinants of health.

Key messages:

- We found no difference in self-reported health between those who compare their situation with friends and neighbours, domestic elites, and people living in other countries.
- In post-communist countries, those who compared their situation to that of their parents and their own situation before the politico-economic transition were less likely to report good health.

Neurodevelopmental multimorbidity and educational outcomes of 766,244 Scottish schoolchildren

Michael Fleming

E Salim[1], M Fleming[1], DF MacKay[1], A Henderson[1], D Kinnear[1], D Clark[2], A King[3], JS McLay[4], SA Cooper[1], JP Pell[1]
[1]Institute of Health and Wellbeing, University of Glasgow, Glasgow, UK
[2]ISD, Information Service Division, Edinburgh, UK
[3]ScotXed, Scottish Government, Edinburgh, UK
[4]Department of Child Health, University of Aberdeen, Aberdeen, UK
Contact: michael.fleming@glasgow.ac.uk

Background:

Neurodevelopmental conditions commonly co-exist in children but, in comparison with adults, childhood multimorbidity has attracted less attention in research and clinical practice.

Methods:

Record linkage of five Scotland-wide databases produced a cohort of 766,244 children attending Scottish schools between 2009 and 2013. Autistic spectrum disorder (ASD) and intellectual disabilities were ascertained from records of special educational need in the annual Pupil Census and attention deficit hyperactivity disorder (ADHD) and depression through relevant encashed prescriptions.

Results:

Neurodevelopmental multimorbidity ($\geq$2 conditions) was identified in 4,789 (0·6%) children; with ASD and ADHD the most common combination. Multimorbidity was associated with significantly increased risk of school absenteeism (adjusted IRR 1·23, 95% CI 1·20-1·28), school exclusion (adjusted IRR 3·04, 95% CI 2·74-3·38), low attainment (adjusted OR 12·07, 95% CI 9·15-15·94) and unemployment (adjusted OR 2·11, 95% CI 1·83-2·45) with clear dose relationships evident between number of conditions (0, 1, $\geq$2) and the last three outcomes. The associations with multimorbidity were stronger in girls than boys. Co-existence of depression was the strongest driver of absenteeism and co-existence of ADHD the strongest driver of exclusion. Low attainment and unemployment were, in part, mediated by absence and attainment respectively, and were not driven by specific conditions but rather multimorbidity from any cause.

Conclusions:

Structuring clinical practice and training around single conditions may disadvantage children with multimorbidity who are at significantly increased risk of adverse outcomes if their complex needs are not recognised and managed.

Key messages:

- Neurodevelopmental multimorbidity can have significant impacts on children's education.
- A holistic healthcare approach is needed to reduce the address their needs and reduce the risk of adverse outcomes.

2.Q. Risk of disability pension and morbidity

Do poor health behaviors have an impact on the transition from sick leave to disability pension?

Pia Svedberg

P Svedberg[1], B Helgadóttir[1], L Mather[1], J Narusyte[1], A Ropponen[1,2], V Blom[1,3]
[1]Division of Insurance Medicine, Karolinska Institutet, Stockholm, Sweden
[2]Finnish Institute of Occupational Health, Helsinki, Finland
[3]The Swedish School of Sport and Health Sciences, Stockholm, Sweden
Contact: pia.svedberg@ki.se

Background:

High age, being a woman, and having low socioeconomic status are among the important risk factors for transitioning from sickness absence (SA) to disability pension (DP). But, little is known about the effect of poor health behaviors, although there are indications that poor health behaviors increase the risk of both SA and DP. The aims were to study the associations between three poor health behaviors (current smoking, high alcohol consumption and low physical activity levels) and DP among individuals who recently been sickness absent, and to explore whether having multiple poor health behaviors increased the risk of transitioning from SA to DP.

Methods:

This prospective cohort study included 1991 twin individuals aged 20-46 who participated in a survey in 2005 and who had been on long-term SA in the two years preceding baseline (date of answering the survey) data collection of health behaviors (smoking, alcohol and physical activity) and relevant covariates. The participants were followed up for incident all-cause DP until the 31st of December 2012 (mean follow-up 5.2 years). National register data of SA and DP were used, and the association between each health behavior and DP was estimated using Cox proportional hazards regression analyses. The results are presented as Hazard Ratios (HR) with 95% Confidence Intervals (CI).

Results:

Results showed that compared to never smoking, current smoking was associated with a higher risk of transitioning from SA to DP (HR 1.76, 95%CI 1.08-2.84). Alcohol use, lack of physical activity or having several poor health behaviors showed no significant associations.

Conclusions:

Being a current smoker influences the risk of transitioning from SA to DP. Poor health behaviors are well established risk factors for poor physical and mental health. Hence, from a public health perspective it is important to emphasize the value of improving health behaviors in general but also among people with a history of SA.

Key messages:

- Many factors including health behaviors influence the risk of transitioning from sickness absence to permanent work incapacity in terms of disability pension.
- Supporting people on sickness absence to improve their health behaviors, e.g. smoking cessation, could be a promising approach to prevent exit from the labor market through disability pension.

Job control and risk of disability pension in the nationwide Danish Work Life Course Cohort

Ida EH Madsen

A Svane-Petersen[1], E Framke[1], JK Sørensen[1], R Rugulies[1,2,3], IEH Madsen[1]
[1]National Research Centre for the Working Environment, Copenhagen, Denmark
[2]Department of Public Health, University of Copenhagen, Copenhagen, Denmark
[3]Department of Psychology, University of Copenhagen, Copenhagen, Denmark
Contact: ihm@nrcwe.dk

Background:

A large number of studies have found job control to be consistently associated with an increased risk of disability pension. However, most previous studies have measured job control by self-report, introducing possible reporting bias inflating the risk estimates. Furthermore, previous studies have not accounted for the potential selection of individuals with pre-existing risk factors for disability pensioning into low control jobs.

Methods:

We analyzed data from the nationwide register-based Danish Work Life Course Cohort (DAWCO; n = 960,562 with approx. 6 million person-years). We measured job control annually by a job exposure matrix, based on a scale of five self-reported items from The Danish Work Environment Cohort Study, and disability pension using registers on public transfer payments. To account for potential selection into occupations with lower levels of job control, we included numerous life course confounders, including parental socioeconomic position and psychiatric and somatic diagnoses.

Results:

Employees in jobs with lower levels of job control had increased risk of disability pensioning. The association attenuated after adjustment for confounders but was not explained by selection into job groups with lower levels of job control (hazard ratio: 1.16 (95% CI: 1.03-1.31).

Conclusions:

Our findings suggest that lower levels of job control are associated with an increased risk of disability pension, and that this association is explained by neither reporting bias nor a selection of individuals with an increased risk of disability pensioning into job groups with lower levels of job control.

Key messages:

- Lower levels of job control appear associated with an increased risk of disability pension independent of life course confounders.
- Further research is needed on preventive measures in occupations with low levels of job control.

Socioeconomic consequences for adults with atrial septal defect: A register based follow-up study

Kirsten Fonager

C Nyebo[1], K Fonager[2,3], ML Larsen[2,4], JJ Andreasen[2,5], S Lundbye-Christensen[2,6], VE Hjortdal[1]
[1]Department of Cardiothoracic and Vascular Surgery, Aarhus Universityhospital, Aarhus, Denmark
[2]Department of Clinical Medicine, Aalborg University, Aalborg, Denmark
[3]Department of Social Medicine, Aalborg University Hospital, Aalborg, Denmark
[4]Department of Cardiology, University Hospital, Aalborg, Denmark
[5]Department of Cardiothoracic Surgery, University Hospital, Aalborg, Denmark
[6]Unit of Clinical Biostatistics, Aalborg University Hospital, Aalborg, Denmark
Contact: k.fonager@rn.dk

Background:

Atrial Septal Defect (ASD) is considered one of the most benign defects among congenital heart disease. The very good short and midterm outcomes after closure in the recent decades has led to believe that the ASD population is almost comparable to the background population after treatment. However, recent studies indicate that these patients are much more affected by their disease than first assumed. In this nationwide cohort study, we report the first long-term follow-up of use of permanent social security benefits and work participation in adults with ASD.

Methods:

All Danish patients born before 1994 and diagnosed with ASD between 1959-2013 (n = 2,277) were identified from the Danish registries. A comparison cohort was created using the Danish Civil Registration System, matching every verified ASD patient with 10 persons from the general population on gender and birth year. We used Cox proportional hazards regression to compare the risk of receiving permanent social security benefits in the ASD patients compared with the matched cohort. Using the DREAM database we calculated the proportion of patients and controls not working at the age of 30 years.

Results:

ASD patients had a higher risk of receiving permanent social security benefits (hazard ratio 2.3 (95% confidence interval 2.1-2.6)) compared with the comparison cohort; 24% of the ASD patients was receiving permanent social security benefits at the end of follow up compared with 12% of the comparison cohort. At the age of 30 years, the proportion not working was 28% in the ASD cohort and 18% in the comparison cohort. Of patients not working 23% had a psychiatric diagnose compared to 6.8% of the controls.

Conclusions:

The risk of receiving permanent social security benefits was twice as high in patients with ASD and the work participation was reduced compared with the background population.

Key messages:

- The poor affiliation to the work force and high prevalence of psychiatric morbidity is worrying.
- It demands for an increased psychosocial support by professionals caring for patients with ASD.

Copenhagen Burnout Inventory On A National Representative Sample Of Pre-School Teachers

Jovana Todorovic

P Piperac[2], Z Terzic-Supic[1], J Todorovic[1], A Maksimovic[3], S Karic[3], M Santric-Milicevic[1]
[1]University of Belgrade, Faculty of Medicine, Institute of Social Medicine, Medical Faculty, Belgrade University, Belgrade, Serbia
[2]University of Belgrade, Faculty of Medicine, Department of Humanities, Belgrade, Serbia
[3]The College for Preschool Teachers, Sabac, Serbia
Contact: jovana.todorovic@med.bg.ac.rs

Background:

Pre-school teachers are faced with work-related stress and are at increased risk of development of burnout syndrome. The aim of this study was to evaluate the reliability of the Serbian version of Copenhagen burnout inventory (CBI) on a National Representative Sample of preschool teachers in Serbia.

Methods:

This was a cross-sectional study conducted between October 2018 and April 2019 which included 456 preschool teachers in Serbia. The instrument contained questions on socio-demographic, socio-economic characteristics, lifestyle characteristics, workplace environment and Serbian version of CBI. Univariate linear regression, multiple linear regression, Cronbach alpha coefficients were performed.

Results:

Cronbach alpha of three domains of CBI were: personal burnout-0.907, work-related burnout-0.878, client-related burnout- 0.903. Multiple linear regression analysis showed that having a tenured contract (ß = 3.46, p = 0.04), working in shifts (ß = 7.94, p = 0.01), and having worse self-perceived health status (ß = -8.88, p = 0.01) were significantly associated with personal burnout. Working in shifts (ß = -4.67, p-0.012) and having worse self-perceived health status (ß = -7.82, $p < 0.001$) were significantly associated with work-related burnout. Age (ß = 0.53, $p < 0.001$), living in urban areas (ß = -6.55, p = 0.015), alcohol consumption (ß = 5.09, p = 0.016), number of children teacher work with (ß0.407, p = 0.005), having teaching equipment (ß = -4.46, p = 0.033), and having worse self-perceived health status (ß = -7.17, $p < 0.0001$) were significantly associated with client-related burnout.

Conclusions:

CBI is a valid instrument for the assessment of burnout among preschool teachers in Serbia. Many workplace-related factors, which could be subject of preventive measures, are associated with domains of burnout in this population.

Key messages:

- Workplace-related factors are associated with burnout among preschool teachers in Serbia.
- CBI is valid instrument for assessment of burnout among preschool teachers.

Earnings among people with multiple sclerosis in Sweden, by education and occupation

Kristina Alexanderson

C Murley[1], M Wiberg[1], P Tinghög[2], K Alexanderson[1], E Palmer[3], J Hillert[4], M Stenbeck[1], E Friberg[1]
[1]Division of Insurance Medicine, Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
[2]Department of Health Sciences, Swedish Red Cross University College, Stockholm, Sweden
[3]Uppsala Department of Economics and Center for Labor Studies, Uppsala Universitet, Uppsala, Sweden
[4]Division of Neurology, Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
Contact: kristina.alexanderson@ki.se

Background:

Multiple sclerosis (MS) may affect the individual's working life. We aimed to 1) investigate the mean levels and distributions of earnings among people with MS (PwMS) before and after MS diagnosis compared to people without an MS diagnosis, and whether such differences in earnings were associated with educational level or occupation and 2) assess the prevalence of sickness absence (SA) and disability pension (DP).

Methods:

Population-based cohort study (10 years prior to 5 years after MS diagnosis) using microdata linked from nationwide Swedish registers of all individuals aged 30-54 with MS diagnosed in 2003-2006 ($n = 2553$) and references without MS ($n = 7584$) randomly selected by stratified matching (sex and age). Annual mean earnings, by educational level and type of occupation, were compared with t-tests. Tobit regressions investigated the associations of earnings with individual characteristics. Lastly, the proportions on SA and DP, stratified by educational level and type of occupation, were examined in the diagnosis year and 5 years later.

Results:

Differences in earnings between PwMS and references were observed beginning one year prior to diagnosis and increased with time. PwMS had lower mean earnings for the diagnosis year (difference = SEK 28,000, p-value$<$0.05), and the difference had more than doubled (p-value$<$0.05) 5 years later. These differences remained after taking educational level and type of occupation into account. PwMS with university education and/or more qualified occupations had mean earnings most like their respective references'. PwMS had higher prevalence of SA and DP than the references, in both the diagnosis year and 5 years later.

Conclusions:

Earnings of people with MS were lower than references' already one year before diagnosis, and the gap increased thereafter. Results indicate that educational level and type of occupation are of importance for earnings. Moreover, SA and DP were more common among people with MS.

Key messages:

- Our results indicate that working-aged people with MS have less earnings than references already one year before diagnosis and that thereafter this gap in earnings increases with time.
- Education and occupation were influential in explaining the people with MS' heterogeneous earnings, with a hierarchal ordering of who maintained similar earnings to their respective peers.

Implementation of health promotion activities in mental health care in Denmark

Loni Ledderer

JE Møller[2], A Møller[1], L Ledderer[1]
[1]Department of Public Health, Aarhus University, Aarhus, Denmark
[2]Center for Health Sciences Education, Aarhus University, Aarhus, Denmark
Contact: loni.ledderer@ph.au.dk

Background:

People suffering from serious mental illness face a high risk of lifestyle-related health problems, and higher mortality and morbidity rates than the rest of the population. The solution to the problem has been to integrate health promotion initiatives in mental health care. In Denmark psychiatric departments have implemented a new strategy and mental health nurses are now asked to screen for risk factors. The aim of this study is to explore how mental health nurses experience working with the screening of risk factors amongst patients with mental illnesses as part of their health promotion activities.

Methods:

We employed a qualitative research design using an interactive approach. Two focus group interviews ($n = 7$; $n = 5$) were conducted with mental health nurses attending a mental health specialist training in Denmark in 2018. The interviews lasted 1 ½ hours, were recorded and transcribed verbatim. Data were organized using NVivo 12 software and a qualitative content analysis was used to describe experiences in a conceptual form.

Results:

The implementation of health promotion activities in mental health care created two different types of dilemmas for the mental health nurses: 1) dilemmas related to health promotion that involved discrepancies between patients' autonomy and wishes, and the health promotion activities that were offered; 2) system-related dilemmas originated from structural factors and working with screening for risk factors. The mental health nurses developed various strategies and found new solutions to navigate these dilemmas.

Conclusions:

Mental health nurses found it challenging to implement health promotion activities in mental health care, although they generally found these activities meaningful. They developed new strategies to overcome the dilemmas.

Key messages:

- Health promotion initiatives need to be adapted to mental health nurses' existing mental healthcare practices in order for them to be meaningful.
- Screening of risk factors is insufficient as a health promotion activity in mental health care.

RT Accidents mortality in Italy: a population-based study in Piedmont on Vulnerable Road Users

Giuseppe Costa

A Pitidis[1], Carlo Mamo[2], Marco Dalmasso[2], G Costa[2]
[1]Environmental and Social Epidemiology, Italian National Institute of Health, Rome, Italy
[2]Epidemiology Unit, Local Health Unit TO3, Turin, Italy
Contact: giuseppe.costa@unito.it

Background:

Among the largest Italian Regions, Piedmont (Northern Italy) had in 2017 a crude rate of road traffic accidents (RTA) deaths greater than the national average. RTA injuries remain a leading cause of injury deaths in Italy. Among them in both Piedmont and Italy many victims are vulnerable road users (VRU): pedestrians, cyclists and users of motorcycles or motorpeds. The study was aimed to describe their mechanisms of injury.

Methods:

Observational study of the resident population in Piedmont from 2003 to 2015. Transportation Injuries (ICD-10: V01-V99) were considered, because of their greater comparability rate in bridge coding studies. A number of 5,185 RTA deaths was observed. Role, type of vehicle of the victim and collision were studied.

Results:

Piedmont in 2017 had a RTA mortality rate (6.35 deaths per 100,000 inhabitants) greater than Italy (IRR = 1.13, 95% CI: 1.00 - 1.29; $p < 0.02$), 48.4% of the victims were VRU similarly to national data (49.8%). In the period the proportion of VRU on RTA deaths steadily increased from 25.6% in 2003 to 49.1% in 2015, in a significant way ($z = 2.79$; $p = 0.005$), because in a context of marked reduction of RTA mortality (-54.5%), the regional trend for VRU shows only a slight decrease (-12,6%). The VRU were: pedestrians (47.0%), motorized two-wheels users (37.4%) and cyclists (15.6%). Among pedestrians 63.9%

deaths were caused by collisions with mainly automobiles (82.1%) and heavy vehicles (12.7%). In case of collision the prevalent causes of death were head injuries (41.5%) and multi-trauma (31.8%). Similar patterns were observed for cyclists, while in motorcyclists 56.5% of deaths were due to loss of control or fixed object.

Conclusions:

VRU injuries remain a public health and social concern. Yet despite their extent, this problem is still not adequately considered in public health prevention programs. The observed mechanisms of injury evidence the importance to enhance the protection of VRU in road traffic circulation.

Key messages:

- In Italy, vulnerable road users are becoming a major group among road traffic injury deaths, because they not follow the general trend of large decrease of RTA injuries.
- Largest VRU group are pedestrians such as cyclists they are hit by cars or heavy vehicles with major trauma, in the motorized two-wheels loss of control and collision with fixed object are important.

3.A. Round table: Re-thinking health inequalities

Organised by: Erasmus MC, Rotterdam
Chair persons: Johannes Siegrist - Germany
Contact: j.mackenbach@erasmusmc.nl

Health inequalities - systematically higher rates of morbidity and mortality among people with a lower socioeconomic position - have been on the public health agenda for decades now. However, despite massive research efforts (and somewhat less massive policy efforts) health inequalities have not narrowed - on the contrary, relative inequalities have widened considerably. It is therefore time for a re-think: after decades of research we need to step back and ask ourselves: what went wrong?

Johan Mackenbach argues, in a book published by Oxford University Press (2019), that the main problem is that public health researchers and policy-makers have misunderstood the nature of health inequalities. They have too often ignored insights from other disciplines, such as economics (which has a stricter attitude to issues of causality) and sociology (which has a subtler understanding the nature of social inequality). They have also failed to integrate contradictory research findings into mainstream thinking.

This workshop will focus on three such contradictions, and will discuss whether it is possible to re-think health inequalities in a way that will allow more effective policy approaches. (1) It has been surprisingly difficult to find convincing scientific evidence for a causal effect of socioeconomic disadvantage on health. Should public health reconsider its idea that health inequalities are caused by social inequalities, and widen their scope to give more room to social selection, genetic factors and other non-causal pathways in their analysis?

(2) There is not a single country in Europe where over the past decades health inequalities, as measured on a relative scale, have narrowed. This is due to the fact that all groups have improved their health, but higher socioeconomic groups have improved more. This is even true in the only European country (i.e., England) in which the government has pursued a large-scale policy program to reduce health inequalities. Should public health accept that reducing relative inequalities in health is impossible, and focus on reducing absolute health inequalities instead?

(3) The Nordic countries, which have been more successful than other European countries in reducing inequalities in material living conditions, do not have smaller health inequalities. It is as if inequalities in other factors, such as psychosocial and behavioural factors, in these countries have filled the gap left by reduced inequalities in material living conditions. Should public health reconsider its idea that material living conditions are the foundation for health, and re-focus on psychological, cultural and other less tangible factors instead?

In this round table Johan Mackenbach will present and illustrate these contradictions and propose his answers to these contentious issues. Then, the four panelists will present their view-points, followed by a general discussion between panelists and the audience.

Key messages:

- After four decades of research into health inequalities, it is necessary to step back and ask ourselves why it has so far been impossible to reduce health inequalities.
- More effective policies to tackle health inequalities will only be possible when public health has come to grips with contradictory research findings.

3.B. Workshop: The Effects of Shared Accommodations on Refugee Health in Germany: An Interdisciplinary Approach

Organised by: School of Public Health, Bielefeld University, Germany
Chair persons: Alexander Krämer - Germany, Kerstin Schmidt - Germany
Contact: kerstin.schmidt1@uni-bielefeld.de

The importance of the relationship between health and migration has been recognised for a long time with a more recent focus on refugee health. The experience of life threatening situations in countries of origin, the flight itself, but also the legal status of a refugee in the destination country brings about many health-related challenges. One area, in which these challenges become particularly visible, is the housing situation of refugees. In contrast to many voluntary migrants, refugees are often required to live in shared accommodations. These can be flats but also buildings constructed for other purposes, such as old factories, gyms, or hotels, container buildings, or tents. Thus, the living conditions of refugees in destination countries are often below the average housing standard of the native population. This situation can on the one hand reinforce challenges to refugees’ physical, psychological and social health, and on the other hand it can hinder the good provision of healthcare at home. This workshop addresses these challenges for the case of Germany - which had the highest number of asylum applications between 2015 and 2017 - by analysing different aspects of refugee health from an interdisciplinary perspective. The contributions bring together the results from theoretical/philosophical reflections, as well as qualitative and quantitative empirical data, including the perspective of refugees and health care providers. The contributions raise questions about the characteristics of accommodations that affect the subjective well-being and health of refugees. The results show that there are particular challenges for health and healthcare provision related to the general situation of accommodation of refugees in Germany. These include the potential transmission of germs and related risks for the physical health of refugees, the creation of a situation of exclusion from society which can worsen psychological stressors, as well as the distance from worshipping places, which can hinder the beneficial effects of communities of faith for the social health of refugees. In addition, the possibilities of maternity care in shared accommodations are often limited due to the lack of privacy, which can represent a stressor for pregnant women and young families.

The results presented in this workshop are the outcomes of some projects developed in the graduate school ‘‘Challenges and Opportunities of Global Refugee Migration for Healthcare in Germany - FlüGe’’. FlüGe encompasses 12 doctoral students, supervised by 12 professors from five faculties at Bielefeld University. It covers a broad range of disciplines (public health, psychology, microbiology, theology, and law) with an active involvement of practice partners, such as clinical and governmental institutions. In taking this approach, the graduate school aims to identify the short-, medium-, and long-term challenges and opportunities posed to global migration for healthcare in Germany and seeks to develop practical solutions.

Key messages:

- Despite the diversity in refugee accommodation in Germany, shared housing in general negatively affects refugee health in various ways.
- The accommodation of refugees poses challenges to the physical, mental and social health of refugees and to the efficient provision of healthcare at home.

Housing facilities for asylum seekers in Germany: Ethical concerns regarding social exclusion, othering and negative effects on health

Sylvia Agbih

S Agbih[1]

[1]Faculty of History, Philosophy and Theology, Bielefeld University, Bielefeld, Germany

Contact: sylvia.agbih@uni-bielefeld.de

Background:

Asylum seekers face many barriers in accessing health care and their well-being is impaired in manifold ways. According to Public Health research the impact on health of social determinants is much higher than the influence of access to health care. Therefore, it is important to take other living conditions like accommodation into serious consideration.

Methods:

The focus will be on how housing conditions allow or prevent opportunities for social participation and autonomy. As a philosophical-ethical paper this contribution attempts to identify moral concerns and ethical questions regarding housing situations under the lens of inclusion and exclusion. This will lead to the question whether they constitute forms of othering. In a first step it will be clarified how inclusion and exclusion are used as analytic frame, particularly whether and how far they are not only descriptive terms but also normative ones. Exemplary cases of housing facilities for asylum seekers in Germany will be given and questioned regarding practices of inclusion and exclusion and how this affects participation and autonomy.

Conclusions:

Apart from contributing to barriers in accessing health care different types of ‘‘exclusive’’ housing for asylum seekers often impedes on social participation and disempowers autonomous choices. Since social exclusion is known to affect (mental) health this raises concerns for health and well-being as well as several other ethical questions.

Questions for further discussion:

What is the responsibility of Public Health regarding the housing conditions of asylum seekers and the negative effects of othering on health?

How do we perceive this in the light of solidarity?

The impact of the housing situation on the health-related quality of life of refugees located in North Rhine-Westfalia, Germany

Matthias Belau

M Belau[1]

[1]School of Public Health, Bielefeld University, Bielefeld, Germany

Contact: m.belau@uni-bielefeld.de

Background:

In 2015 and 2016, more than one million people fled to Germany from war-affected countries - mainly from Syria, Afghanistan and Iraq. Nevertheless, little is known about health-promoting and health-damaging living conditions in refugees located in Germany. Strengthening healthy living conditions could be a measure to increase health-related quality of life (HRQoL) of refugees.

Methods:

The analyses were based on data from the FlüGe Health Study. The study was conducted in the period from February to November 2018 and included interviews and examinations. Participants were recruited from shared (n = 182) and private accommodation (n = 144) in several cities in North Rhine-Westphalia in Germany. The effect of housing situation on health-related quality of life as estimated from a modified version of the SF-12 questionnaire was examined using univariable analyses.

Results:

Three hundred and nine participants ranging in age from 18 to 75 years (Mean 32.4, SD 0.61) gave complete replies. The majority was males (73.0%) and more than half of the respondents (58,4%) were in a partnership. Univariate analysis showed no statistically significant difference in HRQoL scores among participants from shared and private accommodation in physical scale (Mean 51.7, SD 10.05 vs. 49.7, SD 10.88; p = 0.096) and mental scale (Mean 41.9, SD 14.7 vs. 44.3, SD 14.2; p = 0.134).

Conclusions:

From the data it appears that refugees living in shared and private accommodation in Germany have HRQoL scores indicating a relatively moderate HRQoL in physical scale and low HRQoL in mental scale compared to the German population.

The Impact of Refugee Women’s Accommodation on Maternal Health Care Provision

Anne Kasper

A Kasper[1]

[1]School of Public Health, Bielefeld University, Bielefeld, Germany

Contact: anne.kasper@uni-bielefeld.de

Background:

About 1/3 of the persons seeking asylum in Germany are female. The majority of all refugee women in Germany are currently of childbearing age. The maternity period requires specialized care. Maternal health care professionals monitor the physiological processes of maternity and the psychosocial well-being in order to allow an uncomplicated transition to maternity. On arriving in Germany there are different types of accommodation for refugee women: 1) shared reception centers (e.g. tents, containerbuildings, gyms), 2) collective shelters for particularly vulnerable refugees and 3) private apartments. Depending on the woman's accommodation maternal health care professionals are confronted with different situations and conditions in providing care for these women. The aim is to analyze the impact of refugee women's accommodation on maternal health care provision and professional's actions.

Methods:

Structured expert interviews were conducted with maternal health care professionals. The interviews were analyzed following the standards of qualitative thematic analysis with a special focus on refugee women's accommodation and its impact on maternal health care provision.

Results:

The accommodation situation does impact the provision of maternal health care as well as the actions and doings of maternal health care professionals. On the one hand there is a change in tasks, which are no subject to original maternal health care, such as organizing transportation. On the other hand there are challenges in actually executing particular maternal health care actions, such as taking the medical history or performing examinations where there is no or little privacy.

Conclusions:

Accommodation conditions impact maternal health care provision in various ways. Therefore an enhancement of housing for refugee women may improve maternal health care provision and therefore maternal health for refugee women.

Antibiotic resistances of S. aureus in refugee accommodations – an investigation from the microbiological perspective

Ines Kiemann

I Kiemann[1]
[1]Faculty of Biology, Bielefeld University, Bielefeld, Germany
Contact: ines.kiemann@uni-bielefeld.de

Background:

Antimicrobial resistance (AMR) has been added to the list of the "Ten threats to global health" of the WHO. Due to varying rates of AMR persistence in the different countries of the world, there is concern that migration might foster the burden of antibiotic resistance in Europe. As calculated before, prevalence of AMR is elevated in refugees. Refugees are supposed to have higher risk for AMR prevalence, constituted by the conditions in the European host countries and the countries of origin or transit. In European refugee accommodations poor sanitation, overcrowded living conditions and barriers accessing health care services are feasible risk factors. One example for AMR bacteria is the Methicillin-resistant Staphylococcus aureus (MRSA). In the last decades, S. aureus became a global threat for healthcare, through the gain of AMR genes.

Methods:

Nasal swabs voluntarily provided by refugees living in accommodations in Bielefeld (Germany) were checked for presence of S. aureus. After identification by 16S rRNA sequencing the isolates were typified and antibiotic resistances were phenotypically detected by broth dilution method. For MRSA, the resistance genes were identified by PCR.

Results:

Nasal swabs of participating refugees contain antibiotic resistant S. aureus, including MRSA. Some isolates are resistant against various therapeutic antibiotics, like clindamycin and erytromycin. Nearly all isolates are resistant against penicillins. Resistances against vancomycin and the reserve antibiotic linezolid were not detected.

Conclusions:

Efforts to reduce AMR rates in Europe focus on surveillance, screening and antimicrobial stewardship. As the living situation in host countries is expected to be a risk factor for AMR persistence, host countries may also consider improving the accommodation of refugees.

Spiritual participation and its relation to housing conditions for refugees in Germany

Sakin Özisik

S Özisik[1]
[1]School of Public Health, Bielefeld University, Bielefeld, Germany
Contact: sakin.oezisik@uni-bielefeld.de

Background:

Many studies claim a positive relation between religious / spiritual participation and individual wellbeing. Thus, religious communities play a supportive and socializing role, and supply group assistance, security and solidarity also for refugees. Some dimensions of religion, such as the opportunity of practicing congregational rituals, transmitting religious traditions to the next generations, and building a religious/spiritual community may be linked to the housing conditions.

Objectives: The contribution aims to answer the following questions by showing the effects of housing conditions on the well-being of refugees:

1. Is the spirituality of refugees affected after settlement in collective accommodation sites, and if so how?
2. Does the distance or proximity to collective worship places affect the spiritual participation of refugees and their activities in religious organizations?

Methods:

The data is derived from an ongoing research project at Bielefeld University, Germany. The research uses a multi-method approach. Semi-structured qualitative interviews (28) are supported by participatory observations and questionnaire application (N = 120).

Results:

Both in the Interviews and quantitative survey, many Christian, Yezidi and Muslim respondents explicitly argued about their religious participation / nonparticipation due to their housing conditions either in collective accommodation or private housing.

Conclusions:

Christians and Yezidis have fewer opportunities of collective practises of religion due to remote accommodations. The Muslim participants on the contrary have more options of practising with their coreligionists. The availability of religious institutions near to housing places affects this directly.

3.C. Workshop: Bridging the Gap in Digital Public Health in Europe

Organised by: EUPHA (DH)
Chair persons: Luís Velez-Lapão - Portugal, Anthony Staines - Ireland
Contact: luisvlapao@gmail.com

Europe is facing several health challenges and public health plays an important role in it. However, to address the increasing demand for public health services, public health institutions need to tackle digitalization in a proper and evidence-based way. Digital health comprises both an organizational and a technological component. While the technological one has been widely addressed, the organizational one got little attention so far. This is due to a lack of knowledge regarding the understanding of the new role of organizations that provide digital health services. Public health is a field deeply dependent on data and with an important opportunity to leverage information technology. Digital health could, within 10 years establish a new paradigm in public health. The public health professionals need urgently to tackle digital health to bridge the gap with others areas of healthcare. Moreover, since public health is a multi-disciplinary activity we want to take the opportunity to debate digital public health with European experts from different fields of knowledge.

Three presentations from the point of view of People, Technology and Services. Digital health should be addressed as an evidenced-based approach towards both improving health professionals performance and quality of life of patients. This workshop aims at:

- To create the momentum towards the proper use of digital technologies in public health by discussing the main challenges and opportunities for European Public Health.
- To establish a forum to discuss digital public health solutions based on evidence to better improve the adoption of these tools in the public health profession;
- To have a serious discussion after 3 presentations that will clarify the main challenges and opportunities;
- After de presentations, a debate will be guide to help identify the main challenges for digital public health in Europe;

Key messages:

- Public Health Digitalization is essential to address health inequalities in Europe. The workshop identifies what are the main priorities for a sustainable EU public Health digitalization.
- Mutual learning, knowledge and good practice exchange in using digital technology can be organised in various ways – we show practical current examples on how it has been done.

The Challenge of Digital transformation in Public Health in Europe?

Luís Velez-Lapão

L Velez-Lapão[1]
[1]GHTM, Universidade NOVA de Lisboa, Lisbon, Portugal
Contact: luisvlapao@gmail.com

Background:

Healthcare systems are facing many challenges, from demographics to multi-morbidities that are associated with increasing the demand for more services. The new technologies are thought to be a solution to these problems. However, to address these problems with digitalization of healthcare it will imply the combination of proper use of technologies, aligned with integrated working-processes and skilled professionals.

Methods:

This study provides a scoping review on existing public health digital services and aimed to identify the main digitalization challenges, from competencies to technology use. The databases of Pubmed and Ebsco were searched.

Results:

17 papers were selected, and the three main priorities were identified. First, it will highlight the challenges associated with the digitalization of healthcare, the second the implementation of digital services, considering a method to design online service, the third the impact of digitalization on healthcare workforce performance. An overview of the major effects of transformative technologies (e.g. eHealth services, Internet of Things solutions, Artificial Intelligence) on the healthcare workforce will be addressed. Moreover, to what extent is the digital transition affecting formal qualifications of public health professionals? What are the major implications of technological change for future skill needs and competences of the public health workforce? Finally, the discussion examines the challenges of digitalization for public health services in Europe.

Conclusions:

Proper digitalization of healthcare will enable changes in the paradigm of healthcare delivery as well as in the mechanism for patients' participation and engagement. The sustainability of healthcare will depend on how efficient we will make digital-services design.

Key words:

Digital health, Public Health, Digital Transformation, Public Health professionals, Europe

Q-Methodology Evaluation of a European Health Data Analytic End User Framework

Anthony Staines

A Staines[1], *A Boilson*[1], *R Connolly*[1], *P Davis*[1], *J Connolly*[1], *D Weston*[1], *S Gautier*[1]
[1]School of Nursing and Human Sciences, Dublin City University, Dublin, Ireland
Contact: anthony.staines@dcu.ie

Background:

MIDAS (Meaningful Integration of Data Analytics and Services) project is developing a big data platform to use a wide range of health and social care data to support better policy making. As part of the project evaluation, we have used Q-methodology, a well established approach, to understand the perspectives of the individual participants on their needs and how the MIDAS system is meeting them, at its current stage of development.

Methods:

We defined a concourse of 36 statements relevant to project implementation and goals, by working from a logic model for the evaluation, and structured interviews with project participants. This was delivered online to participants. Analyses were done in the qmethod package. The first q-sort was done at 14 months into the project.

Results:

16 people took part, 6 developers, 5 managers, 2 health professionals and 3 others. Three factors were identified in the data. These were tentatively labelled 'Technical optimism', 'End-user focus' and 'End-user optimism'. These loaded well onto individuals, and there were few consensus statements. There were significant differences in perspectives between different groups of participants. In particular, two of the developers held opposite perspectives to most other participants on the third perspective identified. This was drawn to the attention of the participants, and a more intensive process of communication was set-up, seeking to reduce the divergence.

Conclusions:

A Q-methodological approach to evaluating the implementation of a large and complex health ICT system showed considerable divergence between the perspectives of users, developers, and managers. Such divergences can lead to project failure. Q-methodology is a valuable tool has seldom been used in public health research.

Keywords: Q-Methodology, Public Health, Data Analytics, Decision Support.

Artificial Intelligence-based tools to control healthcare associated infections: where do we stand

Alessandro Scardoni

A Scardoni[1], *A Odone*[1]
[1]School of Public Heallth, University Vita-Salute San Raffaele, Milan, Italy
Contact: scardoni.alessandro@gmail.com

Background:

Control of Healthcare associated infections (HAI) is a key public health concern in Europe. Current HAI surveillance systems are based on manual medical records review, vulnerable to misclassification & expensive. Artificial intelligence (AI), as a digital tool, offers great potential to HAI control. Still, scant evidence is available on both its practice and impact.

Methods:

As part of a broader multidisciplinary project, we conducted a systematic review to retrieve, pool and critically apprize all the available evidence on practice, performance and impact of AI-based HAI control programmes. We followed PRISMA and searched the Medline and Embase databases for relevant studies. Included studies were stratified by HAI type and outcomes of interest, including all possible performance measures, clinical, organizational and economic outcomes.

Results:

We screened 2873 records, resulting in 27 papers included in the review. Studies were carried out in 9 countries, the majority in the US (56%), 18.5% in EU countries, 25.9% published in 2018. Two thirds of studies focused on selected types of infections. Study designs were very diverse and performance observed for HAI detection were very heterogeneous, precluding pooled calculation of summary diagnostic accuracy estimates in most instances, but generally higher than non AI-based models. Overall performance measures of AI algorithms were: sensitivity range 19%-92%, accuracy 70.2%-96.1%.

Conclusions:

Use of AI for HAI surveillance of HAI has increased reliability compared to traditional surveillance or to automated surveillance models. With ongoing improvements in information technology, implementation of AI models will improve the quality and capacity of surveillance will support hospital HAI surveillance.

Main messages:

- AI offer great potential to healthcare associated infections control.
- Preliminary evidence show AI-based models have perform better than manual or automated models for HAIs detection.

3.D. Skills building seminar: Develop collaborative tools among public health societies to mutually reinforce their interventions

Organised by: Société Française de Santé Publique
Chair persons: Yves Charpak - SFSP, Emmanuel Rusch - France
Contact: emmanuel.rusch@univ-tours.fr

National public health societies face specific national challenges but also common challenges in several countries but in specific national contexts. At EPH2018, a first workshop entitled ‘ Can national public health societies work together for mutual support on their daily challenges? “ had allowed the national public health societies represented to highlight their interest and their ability to work together. Among the different lines of work identified, one of them was particularly emphasized: ‘How to make allies and influence health policies?’.

This line of work brings different reflections: When adopt postures of conflict and / or cooperation with the public authorities? How to choose to argue from evidence based public health and / or to build and tell simple and consistent stories? What are the situations where we risk going from ‘collaborating with’ actors to’being manipulated by’ actors? What are the conditions for forming effective alliances in public health?

Several topics have been identified as common issues facing the different national public health societies: migration and health, alcohol, food and information of public, physical activities and active mobility, environmental pollution.

As part of this workshop we want to share the feedback of experiences presented by several national public health companies on common public health issues to learn lessons to strengthen their actions.

The feedback presented will help identify and construct shared analysis frameworks, to identify the conditions favoring the influence of national public health societies. The development of these common tools will strengthen their interventions at a national level and enhance their collective effectiveness at the European level. EUPHA is the relevant framework for inscribing this approach in time and space.

Key messages:

- Eupha is the ideal place to meet other public health companies and find opportunities to develop practical transnational collaborations for a better impact of public health at the national level.
- The sharing of experience on common topics will strengthen the influence of the SNSPs and the impact of their actions at the country level.

Public Health, Ministry of Health and Economic Actors: the case of food and information of public

Pierre Lombrail

P Lombrail[1]
[1]Public Health, University Paris 13, Paris, France
Contact: pierre.lombrail@univ-paris13.fr

The experience of France in the implementation of a frontofpack label, the Nutri-Score, clearly illustrates the constant tugofwar between public health experts and the industry and provides a framework for an efficient strategy that could be replicated at the EU level.

Dietary risk factors is in the top three leading causes of morbidity and mortality in Western Europe. Such high burden of diseases urges the implementation of strong and efficient public health strategies in order to curb the impact of poor diets. The public health community has long promoted strategies impacting both individual dietary behavior and the food environment, in a consistent global framework. However, the latter strategies imply to act upon the food and beverage manufacturers, to provide consumers with better information on the nutritional quality of the foods they produce and to ensure a shift in the nutritional composition of the food offer towards healthier foods.

Among the various public health nutrition strategies that are considered efficient in both modifying consumer behavior and enticing reformulations by the food industry, front-of-pack food labeling has been identified as a key policy component in a global program.

The construction of alliances in the field of health: about addictions

Loïc Josseran

L Josseran[1]
[1]Public Health, APHP, Paris, France
Contact: loic.josseran@aphp.fr

The construction of alliances in the field of addictions is a key topic to develop effectiveness and efficiency public health policies.

The short-term economic stakes can not be the alpha and the omega of public policies. Whether general or sectoral, such as agriculture, they must take into account their impact on the health of populations established by scientific work.

3.E. Workshop: Alcohol policy reforms in European countries – challenges and solutions

Organised by: National Institute for Health and Welfare, Finland, ANPAA; EUPHA (PHPP)
Chair persons: Sofia Ribeiro - Portugal, Ilmo Keskimäki - Finland
Contact: ilmo.keskimaki@thl.fi

Alcohol-related harm is a major public health concern in Europe, with levels of alcohol consumption and associated health harm among the highest worldwide. According to the European Commission, premature deaths linked to alcohol account for over 7% of all European morbidity, and alcohol is a major avoidable risk factor for neuropsychiatric disorders, cardiovascular diseases, cirrhosis of the liver, cancer and unintentional and intentional injuries. Even moderate use of alcohol raises long-term risks of certain heart conditions, liver disease and cancers, and frequent use can lead to dependence.

There is extensive research on efficient strategies to reduce alcohol-related harm, alongside high-level policy recommendations. Examples are the WHO's global strategy to reduce harmful use of alcohol and the WHO European office's European action plan to reduce the harmful use of alcohol 2012-2020. The European Union (EU) strategy to support member states in reducing alcohol-related harm expired in 2012. Since then, the Committee on National Alcohol Policy and Action (CNAPA) has drawn up a non-binding Action Plan in relation to alcohol and EU countries have the main responsibility for their national alcohol policy.

Despite strong evidence bases supporting alcohol policy, the implementation of potentially effective alcohol policy is often challenged by companies with commercial interests seeking to undermine evidence and advocate for less effective alternatives. These alternatives, such as education or voluntary industry action, are often favoured by politicians and the public. This opposition to evidence-based alcohol policy represents a challenge to public health.

In this session, we will discuss recent developments in alcohol policy reform in Estonia, Finland and Scotland; reflecting on the outcomes of policies and the challenges faced in implementation. We invite commentaries from national experts and from the DG Sante and WHO Euro. Among these the French commentary will address the influence of the alcohol industry in circumventing effective public health policies, with discussions concerning the new strict French low-risk guidelines on alcohol use as one example. The objective of this workshop is to share experiences of the challenges faced in applying effective alcohol policies, to discuss ways to tackle those challenges, and to invite the EU and the WHO to share their views on ways to overcome these barriers in future policy advocacy.

Key messages:

- Commercial determinants of health are a powerful force in preventing effective public health policy on alcohol-related harm.
- The public health community need to work in a persistent and coordinated manner to bring in a suite of effective alcohol policy interventions across Europe.

Estonia: Problems created by border-trade for applying high-tax alcohol policy

Heli Laarmann

T Täht[1], H Laarmann[1]
[1]Public Health Department, Ministry of Social Affairs, Tallinn, Estonia
Contact: heli.laarmann@sm.ee

In early 2000s, Estonia had one of the highest levels of alcohol consumption globally. In 2008, the average salary could buy 62 litres of strong spirits, compared with 28 litres in 2000; the increase of affordability was one of the highest in the EU. Since then, alcohol consumption per capita has been reduced by a third, which has also led to a reduction in related problems: mortality from alcohol-related illnesses has fallen by 40%. This was achieved with the progressive adoption of measures that rely heavily, but not exclusively, on increasing excise taxes. In 2014 a comprehensive alcohol policy document was adopted, paving the way to the measures in all 10 areas of WHO global strategy to reduce harmful use of alcohol. Since then Estonia has launched treatment programme and awareness campaigns, restricted advertising and the exposure of alcohol in the public sphere.

By 2017, the over-exploitation of the tax-based measures backfired. The twofold alcohol price difference between Estonia and Latvia, resulting from doubling the excise tax for beer and raising significantly those for other alcoholic beverages, caused an unintended increase in cross-border trade between the two countries. This, in turn, caused a new wave of public discussion around pricing policies, and a loss of popular support for tax increases. As a first step to address the problem, the government halved the tax increase planned for February 2018, thus increasing beer tax by 9% and spirits tax by 5%. Tax increases scheduled for 2019 and 2020 were cancelled, and taxes on spirits, beer and cider were cut by 25% instead. This resulted in Latvia decreasing their spirits taxes by 15% in turn. This development forces health promoters to seek new ways to reduce harm to public health and win back support to healthy policy choices.

Finnish alcohol policy reform: battle over public health objectives

Pia Mäkelä

P Mäkelä[1]
[1]Department of Public Health Solutions, National Institute for Health and Welfare, Helsinki, Finland
Contact: pia.makela@thl.fi

A new Alcohol Act came into force in Finland in 2018. The preparation of a comprehensive reform of the alcohol legislation was started already in 2011. The aim of Finnish alcohol policy has been to reduce alcohol-related harm, and the central means to do that have been by way of high taxation and restrictions in the physical availability of alcohol, in which the state alcohol monopoly has had a central role. The process of reforming the act was a long battle between forces that wished to continue underlining the public health aims and using efficient tools to reach those aims on the one hand, and neoliberal politicians aligned with the strong alcohol industry lobby and enthusiasts in social media who wished to get rid of regulation. The new Act somewhat expanded the rights of grocery stores to sell alcohol and de-regulated the on-premise trade by dismantling regulations in the old legislation. The retail state monopoly was weakened as a result, but it still has an important impact on restricting the physical availability of alcohol. Previously when alcohol has been made more available, consumption has increased, and also this time this was the expected outcome. However, an interrupted time series analysis has shown no statistically significant effect of the law change in the first year. One central explanation seems to be that price competition has been less intense than expected. Nonetheless, despite the fact that alcohol taxes were raised, a 10-year downward trend in alcohol consumption from 2008 to 2017 was halted.

The Scottish case: minimum unit pricing for alcohol

Shona Hilton

S Hilton[1], SV Katikireddi[1]
[1]MRC/CSO Social & Public Health Sciences Unit, University of Glasgow, Glasgow, UK
Contact: shona.hilton@glasgow.ac.uk

There have been longstanding social and public health concerns about the levels of harmful alcohol consumption in Scotland. The Alcohol (Minimum Pricing) (Scotland) Act 2012 targets all alcohol sold through licensed premises in Scotland by ensuring it cannot be sold below a set minimum unit price. The pricing policy is currently set at 50p per unit of alcohol. Following a legal challenge and a vote in the Scottish Parliament, minimum unit pricing was implemented in Scotland on 1 May 2018. The aim of the Scottish alcohol policy has been to reduce the adverse public health consequences of alcohol consumption. It has also been identified as a potential measure for reducing health inequalities since alcohol-related harms are strongly socially patterned. The Scottish alcohol policy is important case to consider for a number of reasons. First, the nature of the policy differs. Rather than the introduction of a variable floor price, which may encourage switching in consumption from one product to another to maintain alcohol intake, minimum unit pricing introduces a price threshold that is uniform across all alcohol products. Second, minimum unit pricing is being introduced into a competitive commercial environment with strong vested interests, rather than a government-controlled monopoly. Third, the policy has been framed as a public health intervention, rather than primarily for revenue-raising reasons. Research on its development and evaluation will be considered to inform broader discussions on policy advocacy. Here we show a visualisation of the minimum unit pricing policy network to highlight how the public health community could work in more coordinated manner to support alcohol policy interventions.

3.F. Round table: Applying multidisciplinary sciences to improve paediatric primary care for children in Europe

Organised by: EUPHA (CAPH)
Chair persons: Danielle Jansen - EUPHA (CAPH), Jochen Ehrich - Germany
Contact: d.e.m.c.jansen@umcg.nl

Considerable progress has been made in improving child health and well-being in Europe over the past 40 years, with great reductions in neonatal, and child deaths, and in deaths from causes such as vaccine-preventable diseases. Paediatric primary care (PPC) has significantly contributed to these advances. However, there are still differences between and within countries regarding the content and organizations of primary care for children that might have an impact on important aspects such as access and availability of primary care. These cross-country and within-country differences together with current and future challenges in child health care, such as increasing prevalence of chronic and long-term conditions, fragmentation of care and shortage of health personnel, pose a complex challenge for European countries. Working towards an approach to tackle these challenges requires the vision, input and collaboration of multidisciplinary sciences.

In this workshop four perspectives are brought together with the goal to learn from each other's experiences and to establish a common knowledge base on how to collaborate between different disciplines and sciences to bring PPC to a next level. The first presentation will be from a public health perspective and is about the comparison of actual and desired organization and content of adolescent health services. The second presentation will be a paediatrician's perspective and stresses the importance of an adequately trained paediatric workforce. The third presentation will be from a sociological perspective and focuses on the societal scale drivers framing health among children and their families. In the final presentation a philosophical perspective will be given on adherence to therapy, resilience and resonance in the treatment triangle of 'patient-family-therapist'. The presentations will be followed by a round table discussion in which the audience will be involved: the presenters will answer questions and discuss with the audience how we should create better and sustainable PCP by making use of multiple disciplines and sciences.

Key messages:

- Differences between and within countries regarding the content and organizations of primary care for children might have an impact on important aspects such as access and availability of primary care.
- Working towards an approach to tackle challenges in paediatric primary care requires the vision, input and collaboration of multidisciplinary sciences.

Organization and content of primary care for adolescents – comparison of actual and desired situation

Danielle Jansen

DEMC Jansen[1], A Visser[1], JPM Vervoort[1], P Kocken[2], SA Reijneveld[1], M Blair[3], D Alexander[3], M Rigby[3], PA Michaud[4]
[1]Health Sciences, University Medical Center Groningen, Groningen, Netherlands

[3]Imperial College, London, UK
[4]University Hospital, Lausanne, Switzerland
Contact: d.e.m.c.jansen@umcg.nl

To successfully navigate increasing autonomy, independence and health behaviors in adolescence, accessible adolescent health care services (AHS) are essential. AHS comprise all services in primary care that are aimed at the specific needs of adolescents and can be provided in various settings such as public services, private services, schools and hospitals. In the MOCHA project (Models of Child Health Appraised) we assessed the structure and content of AHS in 30 European countries against the standards in the field of adolescent health services: accessibility, staff attitude, communication, staff competency and skills, confidential and continuous care, age appropriate environment, involvement in health care, equity and respect and a strong link with the community. The results revealed that although half of the 30 countries did adopt adolescent-specific policies, many countries did not meet the current standards of quality health care for adolescents. For example, the ability to provide emergency mental health care is limited. In addition, one third of the countries do not have a formal policy which guarantees the confidentiality of a consult and the possibility to consult a physician without parents knowing. Finally, around half of the countries do not have specialized centers in adolescent health care in order to tackle comprehensive health issues. Access to adolescent health care services needs to be improved for vulnerable adolescents such as migrant adolescents. Schools, ambulatory settings and hospitals should offer accessible, comprehensive health care and a culturally appropriate approach, particularly given the number of migrant adolescents living in EU and EEA countries. Finally, the health care systems should improve their communication strategies, to assist young people in understanding their rights and responsibility in the domain of health, and how and where to access to adequate care.

Children deserve adequately trained doctors

Károly Illy

K Illy[1]
[1]Ziekenhuis Rivierenland, Tiel, Netherlands
Contact: Karoly.Illy@zrt.nl

Children treated in different European countries continue to have very variable outcomes. Among several factors that might affect these outcomes, organisation of primary care services for children and training programmes for primary care clinicians are likely to be important factors.

Children have an unquestionable right to health, safety, and wellbeing. Children have the right to access the highest possible standards of health-care services and facilities, both in primary health care and when they need specialised care. Any restriction of provision of appropriate care would contradict article 24 of the UN Convention on the Rights of the Child.

Paediatric primary care is an academic and scientific discipline dealing with all issues affecting the health and wellbeing of infants, children, and adolescents from birth to adulthood in the context of their family, community, and culture. The primary clinician, ideally a paediatrician, is the first contact for children until they reach adulthood and is thus responsible for provision of comprehensive and continuing care throughout infancy, childhood, and adolescence.

Paediatric care in both primary care and hospital settings needs special knowledge, ethics, empathic behaviour, and access to services, including disease prevention and health promotion. These aspects are therefore mandatory for all paediatric training both for paediatricians and family doctors.

There should be a structured and accountable paediatric training programme for all doctors providing first-line care to children in primary care. When family doctors provide primary health care close collaboration with paediatricians and adequate continued training in both paediatrics and primary care is advised. Moreover, all children need timely access to professional paediatric advice.

Improving child and adolescent public health from a sociological point of view

Sakari Karvonen

S Karvonen[1]
[1]National Institute for Health and Welfare, Helsinki, Finland
Contact: sakari.karvonen@thl.fi

Changes in social divisions and their intersections are keys to understanding child and adolescent health from a sociological perspective. Furthermore, with European societies facing demographic change, aging of the population will also lead to a change in the societal position of children, young people and their families. This paper will focus on discussing ways to improving child and adolescent public health with special reference to broader societal and demographic changes and their implications to service provision, milieux and (collective) lifestyles of families. Broadly the point of the presentation is that ignoring the larger societal context may amount to prioritizing services, programmes or income transfers contributing to few or no public health effects at all.

Clinical philosophy in the context of pediatric care

Jochen Ehrich

J Ehrich[1], *L Hirn*[2], *J Manemann*[3]
[1]Children's Hospital, Hannover Medical School, Hannover, Germany
[2]Association for Applied Philosophy (GAP), University of Vienna, Vienna, Austria
[3]Philosophical Research Institute, Hannover University, Hannover, Germany
Contact: ehrich.jochen@mh-hannover.de

Medical care may be better in many countries than it currently is. Developing countries are in the need to catch up with affluent countries, and rich countries have a need for answering the question of how quality of health care can be improved for their total population despite increasing high-technology-induced cost through comprehensive cost-benefit analyzes. Health is about 85% dependent on general health care and 15% on medical care. The current quality differences of health care not only have their roots in economic crises, but in the lack of application of the thought model of 'root-cause-effect long-term consequences.

The questions arise as to whether this lack of integration of philosophical perspectives and activities contributes to deficiencies in the health care system and how philosophy could lead to new pathways of thinking. Obviously, the health systems of many European countries are having major problems translating the necessary changes in care from the theory level to the policy executive at the practical level. Furthermore, in many health care systems, adequate socio-philosophical concepts for adapting to constantly changing social conditions are missing with regard to adequate, accessible and affordable health care.

This presentation discusses the pros and cons of greater involvement of spiritual welfare, clinical philosophy and philosophical practices in medical care for adolescents in order to improve 1. adherence to therapy, 2. resilience and 3. resonance in the treatment triangle of 'patient-family-therapist'.

3.G. Workshop: Impact of nutrition on non-communicable chronic diseases: a global perspective

Organised by: EUPHA (FN), EUPHA (CHR)
Chair persons: Tatjana Buzeti - EUPHA (FN), Iveta Nagyova - EUPHA (CHR)
Contact: giuseppe.grosso@unict.it

Non-communicable chronic diseases (NCDs) represent a public health issue due to their profound impact on population health. Major NCDs risk factors, including obesity, hypertension and diabetes, represent a threat of gigantic proportion, while intervention to prevent NCDs remains of paramount importance in order to decrease their burden over the next decades. Among others, quality of diets has changed substantially and a global shift to unhealthy diet high in calories and highly processed foods mainly due to the rapid urbanisation, increasing incomes, and inadequate accessibility of nutritious foods has been observed. As the burden of NCDs across the worlds remains unacceptably high, the international policy framework should aim to develop evidence-based policy approaches to reduce such burden globally.

In this context, the EUPHA Sections on Food and Nutrition and on Chronic Diseases aim to propose a joint workshop to provide the latest updates from leading scientists and experts involved in global health research, with a special focus on NCDs and nutrition-related risk factors.

The objectives of the present workshop are the following: To quantify the burden and temporal trends of non-communicable chronic diseases risk factors (such as obesity, elevated blood pressure and diabetes) all around the globe, with a focus on European countries; To assess the impact of nutrition-related risk factors on non-communicable chronic diseases; To explore socio-economic and cultural correlates to dietary changes in developed and developing countries; To discuss the usage of instruments aimed to identify best practices in food policies to prevent junk food consumption.

Organizing the present workshop would provide an important occasion for gathering experts in the field and sharing opinions with the audience in light of the presented results. All publication discussed have been published recently, others are ongoing projects, thus providing a unique opportunity to discuss about potential advocacy activities and policy approaches in the context of a EUPHA conference.

Key messages:

- The workshop will provide insights on the current burden of NCDs risk factors.
- The workshop will focus on dietary risk factors, their socio-economic determinants, and strategies to implement a healthy and sustainable diet globally.

Global trends of chronic non-communicable diseases risk factors

Mariachiara Di Cesare

M Di Cesare[1]
[1]Department of Natural Sciences, Middlesex University London, London, UK
Contact: m.di-cesare@imperial.ac.uk

Background:

One of the global targets for non-communicable diseases is to reduce, by 2025, the rise in global trends of major non-communicable diseases (NCDs). We aimed to estimate worldwide trends in NCD risk factors.

Methods:

Data from the NCD Risk Factor Collaboration (NCD-RisC) allowed the analysis of over 128 million children, adolescents, and adults with available information on height and weight, 4.4 million participants with data on diabetes through measurement of its biomarkers, and 19 million adults that had measured the blood pressures.

Results:

No changes in age-standardised mean BMI in girls and boys from 1975 to 2016 were registered in eastern Europe, while an increase of up to 1.00 kg/m2 per decade was reported in central Latin America (for girls) and in Polynesia and Micronesia (for boys). Global prevalence of obesity increased from less than 1% in 1975 to 5.6% and 7.8% in 2016 in girls and boys, respectively. In adults, prevalence of obesity increased from 3.2% in 1975 to 10.8% in 2014 in men, and from 6.4% to 14.9% in women. Global diabetes prevalence increased from 4.3% in 1980 to 9.0% in 2014 in men, and from 5.0% to 7.9% in women; the lowest prevalence in 2014 has been recorded in northwestern Europe. The number of adults with diabetes in the world increased from 108 million in 1980 to 422 million in 2014. Estimation from current trends shows that only a minority of countries (mostly in western Europe) have a 50% or higher probability of halting the rise of diabetes by 2025. Global prevalence of raised blood pressure was more than 20% in both men and women in 2015. Globally, the number of adults with raised blood pressure increased from 594 million in 1975 to 1.13 billion in 2015, with the increase largely in low-income and middle-income countries.

Interpretation:

The burden of NCD risk factors is partially due to population growth and ageing. However, lifestyle factors play a crucial role in NCD prevention.

Impact of nutritional risk factors on chronic non-communicable diseases

Giuseppe Grosso

G Grosso[1]
[1]Department of Biomedical and Biotechnological Sciences, University of Catania, Catania, Italy
Contact: giuseppe.grosso@unict.it

Background:

modifiable risk factors, can help to identify emerging threats to population health and opportunities for prevention of chronic non-communicable diseases (NCD). Among various risk factors, poor nutrition quality has been identified as a leading determinant of NCD.

Methods:

The Global Burden of Diseases (GBD) Study provided a comprehensive comparative risk assessment (CRA) of risk factor for NCD, quantifying the impact of behavioural, environmental and occupational, and metabolic risk-outcome pairs that met the GBD study criteria for convincing or probable evidence of causation. Special focus on nutritional risk factors will be dedicated, discussing the proportion of disease-specific burden attributable to each dietary risk factor and the level of intake associated with the lowest risk of mortality.

Results:

In 2017, over 30 million deaths were attributable to risk factors. When ranked, high systolic blood pressure was the leading risk factor, accounting for more than 10 million deaths, followed by, high fasting plasma glucose, and high body-mass index. A total of 11 million deaths were attributable to dietary risk factors. High intake of sodium, low intake of whole grains, and low intake of fruits were the leading dietary risk factors for deaths globally. However, important differences between regions and outcome (i.e., cardiovascular disease vs. cancer) have been registered. Besides the major aforementioned factors, underrated dietary risk factors, such as low calcium intake, have been found important contributors to cancer burden in certain developed countries.

Interpretation:

The combination of increasing metabolic risks and population ageing will probably continue to drive the increasing trends in NCD at the global level. These data provide a comprehensive picture of the potential impact of suboptimal diet on NCD mortality and morbidity, highlighting the need for improving diet across nations.

Socio-economic determinants of nutrition transition in Southern European countries

Licia Iacoviello

L Iacoviello[1]
[1]Department of Medicine and Surgery, University of Insubria, Varese, Italy
Contact: licia.iacoviello@moli-sani.org

Issue/problem:

Traditional dietary patterns in southern European countries are changing into less healthy choices, especially among the younger generations.

Description of the problem:

There is consistent evidence of a transition from Mediterranean foods preference toward a higher consumption of high-caloric and hyper-processed foods. Potential reasons for the observed nutrition transition or barriers for adopting healthy dietary pattern across the borders of the Mediterranean basin are represented by lifestyle changes, food globalization, economic, and socio-cultural factors.

Results:

Emerging socioeconomic inequalities in other domains of healthy dietary behaviors such as dietary variety, access to organic foods and food purchasing behavior seems to affect Southern Mediterranean countries while countries in Northern Europe and some other Countries around the world are currently embracing a Mediterranean-like dietary pattern. A potential cause of this downward trend could be the increasing prices of some food items of the Mediterranean diet pyramid. Recent evidence has shown a possible involvement of the economic crisis, as material resources becoming strong determinants of the adherence to the Mediterranean diet just after the recession started in 2007-2008 in part of Europe. Undesirable dietary modifications possibly linked to the current economic crisis were mainly reported by lower socioeconomic groups.

Interpretation:

Traditional healthy dietary patterns have become socioeconomically patterned, and the prominent role of financial over cultural resources in determining the adherence to this pattern should be taken into account. The current economic crisis represents a major health threat for the general population but in particular for the most vulnerable socioeconomic groups, possibly leading to wider gaps in terms of risk/protective factors across socioeconomic categories.

Epidemiological and nutritional transition in low- and middle-income countries

Saverio Stranges

S Stranges[1]
[1]Department of Epidemiology and Biostatistics, Western University, London, Ontario, Canada
Contact: saverio.stranges@uwo.ca

Issue/problem:

In the last decades, the number of deaths from non-communicable diseases in developing countries has risen to those observed in developed countries.

Description of the problem:

Nutritional research in developing countries has primarily focused on under-nutrition, particularly among vulnerable population subgroups such as women and children. However, while economic growth has a significant social impact at population level, there is suggestive evidence of an ongoing nutritional transition leading to concurrent under- and over-nutrition in the population.

Results:

The ongoing nutritional transition in these settings has been mostly linked to the rapid process of urbanisation and westernization. Data from several developing countries suggest that improvements in developmental indicators is accompanied by higher availability of highly processed poorly nutritious foods. Regarding socioeconomic factors, results demonstrated that better education and better living standards were associated with higher odds of overweight/obesity after adjusting for confounders, including urban vs. rural setting. This is likely a consequence of the ongoing nutritional and epidemiological transition occurring in these settings. In fact, developing countries have not yet reached the same phase of nutritional transition as an economically affluent country, and while high-calorie diets comprising fast-food are the more economically affordable option in the latter, such diets are still reserved for the more affluent individuals in some developing countries, where economic growth has only just begun to allow affluent individuals to afford fast-food.

Conclusions:

Understanding the underlying ecological and socioeconomic roots of both extremes of the nutritional status is vital to design successful public health interventions.

Identifying best practices in junk food taxation and other food policies: Selected examples and their assessment

Piotr Romaniuk

P Romaniuk[1]
[1]Department of Health Policy, School of Public Health, Medical University of Silesia, Katowice, Poland
Contact: promaniuk@sum.edu.pl

Issue/problem:

Noncommunicable diseases are the main contributor to the global mortality, being responsible, as estimated, for 71% of deaths each year. About 80 of dietary dependent diseases has been identified so far, and their prevalence tends to exceed 30% in some populations.

Description of the problem:

The growing prevalence of these diseases, along with impact on the quality of life, disabilities, as well as rising direct and indirect economic costs, constitute a basic foundation for emerging efforts to develop and implement new solutions within national health policies aimed at modifying dietary behaviours and reducing their negative impact on health status of individuals and populations. To address these problems the Joint Funding Action "Effectiveness of existing policies for lifestyle interventions - Policy Evaluation Network (PEN)" has been initiated, in which 28 research group across Europe are collaborating.

Results:

The primary aim of the presented study will be to discuss the usage of the PEN instrument to identify best practices in food policies, including sugar sweetened beverages and junk food taxation. Previous examples of the instrument implementation will also be presented, including New Zealand, Australia and Canada, along with the results of current works on its development within the project. The second basic aspect for the study is to discuss and assess examples of food policies implemented in selected countries in terms of their effectiveness in modifying unhealthy behaviours.

Lessons:

The time that has passed since the implementation of the evaluated solutions is too short to assess actual impact on health. Nonetheless, the existing evidence, including data from countries being the most successful examples of junk food taxation, like Mexico and Hungary, suggest that their impact on consumer choices, health literacy and also food industry in terms of food products composition, is positive.

3.H. Workshop: Access to health services in health systems providing universal coverage

Organised by: French National Institute of Health and Medical Research
Chair persons: Olivier Grimaud - France, Helmut Brand - Netherlands
Contact: olivier.grimaud@ehesp.fr

Universal health coverage (UHC) is part of the global WHO strategy to improve health. UHC and equity in access to care fall within the shared principles and values of EU health systems. However, as reported in 2016 by the Expert panel on effective ways of investing in health (EXPH), significant amount of unmet needs persisted both between and within EU member states. Access to health services encompasses the dimensions of affordability, user experience and availability of services with potential barriers arising at individual, providers or health systems levels. Health needs are constantly evolving as a consequence of population ageing and of health care technology development. Consequently access to care does not simply mean availability of a single component of care, but rather to an array of pertinent, coordinated, cost-effective and timely primary and specialized health and social interventions. Measuring performance in that respect is beyond the ability of commonly used "national level" indicators of access. Available research suggests that achieving ubiquitous access to optimal care across territories and populations (eg socioeconomic groups) is hard to achieve. This applies to the whole spectrum of health interventions, from preventive care such as immunizations to multidisciplinary interventions required for the management of chronic diseases. In this context, the workshop proposes to present examples of policy initiatives and results from research projects focusing on access and use of health care conducted in a variety of settings. The aims are to share knowledge about methods used in measuring variations of access, to improve understanding of their determinants and to identify avenues for improving performance.

The workshop is proposed by a multidisciplinary and international group of research teams. It will start with a short introduction from the chair (5 minutes, Olivier Grimaud) followed by five presentations (10 minutes) addressing the issues of variations in access and use of care from different research teams and in a variety of settings. The first presentation will report on an innovative policy aiming at improving UHC in India. The following presentations will illustrate the challenges of providing access in high income countries, including, Scotland, France and Australia. In the last part of the workshop (30 minutes) comments from Prof Helmut Brand (former expert panel member of the EXPH) will introduce a general discussion with the audience moderated by the chair.

Key messages:

- Even when the conditions for universal health coverage are in place, providing equitable access to quality care remains a challenge.
- Understanding variations in access to care would help improve performance and equity.

''Living long in India''– India's progress towards Universal Health Coverage

Lakshmi Balraj

L Balraj[1,2], *H Brand*[1,2]
[1]Departement of International Health, School CAPHRI, Faculty of Health Medicine and Life Sciences, Maastricht, Netherlands
[2]Prasanna School of Public Health, Manipal Academy of Higher Education, Manipal, India
Contact: lakshmi.balraj@gmail.com

Issue:

There are multiple small health insurance schemes throughout India. However, high out-of-pocket (OOP) expenditures, unaffordable and inequitable access to healthcare services still persist. In an attempt to address these issues and achieve Universal Health Coverage (UHC), India launched the healthcare scheme 'Ayushman Bharat' (''long live India'') in 2018.

Description:

The Ayushman Bharat (AB) scheme has two components which include 1) transforming the existing primary healthcare centers (PHC) under the control of State Governments and 2) the National Health Protection Scheme (NHPS) also known as ''ModiCare'' - a health insurance. The scheme aims to transform nearly 150.000 PHCs to deliver comprehensive primary healthcare services across the country by 2022. NHPS covers the costs of almost all secondary and many tertiary care procedures of about 40% of the total Indian population. The coverage will be approximately €6.400 per year per beneficiary family; 60% of the costs are borne by the Centre and 40% by the States.

Results:

Approximately €127 million have already been allocated by the Centre towards the AB scheme for the fiscal year 2018-19. Till date, around 29 million health insurance cards have been issued, approximately 1,8 million beneficiaries have been admitted and around 15.291 hospitals have been empaneled under NHPS. However, there is no data available validating the usage of the health services yet. Few Indian states are yet to implement the AB scheme.

Lessons:

For the first time, attempts have been made to provide affordable healthcare services to the Indian population under a single common initiative. However, the AB scheme fails to cover outpatient health services, which are an important part of OOP expenses in India.

Main message:

The effort to launch Ayushman Bharat in a big, democratic and diverse country like India has to be lauded, which not only aims to make healthcare services affordable but also aligns itself to the concept of UHC.

Variations in the use of caesarean section: a Comparison between France and Australia

Karine Chevreul

K Chevreul[3,5], *A Shand*[1,2], *D Korb*[3,4], *E LeRoux*[3,5], *N Nassar*[1], *O Sibony*[3], *A Bisits*[2], *C Alberti*[3,5]

[4]Université de Paris, INSERM U1153, EPOPé, INSERM, Paris, France
[5]Université de Paris, UMR 1123 ECEVE, INSERM, Paris, France
Contact: karine.chevreul@urc-eco.fr

Background:

There has been a rise in obstetric intervention during labour and birth including rates of caesarean section around the world. The rates of caesarean section are lower in France (20%) than Australia (34%). Both countries have universal health care systems. Australia has a well-established program of obstetric benchmarking and national data collection for comparing maternal and perinatal outcomes taking into account maternity units and maternal characteristics. Although the optimal caesarean section rate is not known, variation in caesarean section rates raise questions about what is driving variation in practice and whether the right care is being delivered. The World Health Organisation has recently released non-clinical recommendations aiming to reduce unnecessary caesarean sections, including that births are classified by Robson classification for easier comparison.

Methods:

We aim to compare rates of mode of birth in 2 tertiary hospitals- one in France and one in Australia using Robson classification. This project will investigate differences in patient casemix, and obstetric management that may lead to differences in outcome. In addition, we will try to explore differences in the health systems including clinical activity, induction rates, staffing (number, type (medical, nursing, midwifery)), and models of care.

Outcomes:

Caesarean section is one of the most common operations performed in hospitals. Important variations of surgical rates raise question regarding whether access to this procedure is optimized. Determining current practice and outcomes of women in two different settings will provide important data to inform hospital practice and further research. In addition, this research may inform national guidelines about indications for caesarean section.

Socio-economic inequalities in timing of childhood immunizations in Scotland

Anna Pearce

A Pearce[1], *P Henery*[1], *C Cameron*[2], *R Dundas*[1], *V Katikireddi*[1], *A Leyland*[1]
[1]MRC/CSO Social and Public Health Sciences Unit, University of Glasgow, Glasgow, UK
[2]NHS National Services Scotland, Health Protection Scotland, Glasgow, UK
Contact: Anna.Pearce@glasgow.ac.uk

In Scotland, like many other European countries, childhood immunization coverage is generally high, often exceeding levels typically required to achieve herd immunity (95%): uptake of the primary vaccines (excluding rotavirus) is ~96% (at 12month(m)), with the 1st dose of measles, mumps and rubella (MMR) at 97% (by 5 years). However, the recommended age to receive these vaccines is 2-4m and 12-13m respectively. Delays beyond these ages may indicate vaccine hesitancy or barriers to access and can increase the likelihood of disease outbreaks, especially if clustered among certain geographical or social groups. We used quantile regression to examine the age by which 95% coverage was met in different groups.

We analyzed data from the Scottish Immunisation and Recall System, for all children born in Scotland 2010-12 (n~200,000), estimating proportions immunized 'on time' with the primary (by age 5m) and MMR (by 14m) vaccines. Next we used quantile regression (with 95% cut-points) to calculate the age by which 95% coverage was reached among this cohort of children, overall and according to neighbourhood deprivation (Scottish Index of Multiple Deprivation[SIMD] deciles).

As in national reports, uptake of the primaries (at 12m) and MMR (at 5y) was >95%, with 91% and 89% immunized 'on time' (as defined above). Nationally, primary vaccines uptake reached 95% by age 7m. This varied by SIMD, from 6m in the least disadvantaged decile, to 9m in the most disadvantaged decile (difference 3m, CI: 2.7-3.3). Uptake of MMR reached 95% a year later than recommended (26m), with no discernible pattern by SIMD.

In Scotland, the age by which immunization levels meet those typically required to achieve herd immunity may be sub-optimal, particularly for MMR and (for primary vaccines) disadvantaged neighborhoods. This same approach might be used in other nations with high coverage to identify population groups that may be experiencing barriers to access and inform local intervention content

Geographical variations in access to expert centers for multiple sclerosis in France

Emmanuelle Leray

E Leray[1], *F Mamadou*[1], *A Guilleux*[1], *J Roux*[1], *O Grimaud*[1]
[1]University of Rennes, EHESP, REPERES - EA 7449, Rennes, France
Contact: emmanuelle.leray@ehesp.fr

Background:

Multiple sclerosis (MS) is a chronic neurological disease affecting about 100,000 persons in France. Disease management is mainly supervised by the neurologist, supported by the general practitioner (GP). The complexity of the disease, due to the variety of symptoms as well as the recent changes in the therapeutic arsenal, requires both a high level of expertise and coordination between the different health care providers. To face this challenge, integrated and coordinated network of services ''MS expert centers'' have been progressively set up from 2000 onwards. Our objectives are to describe referrals to MS expert centers over the 2010-2015 period, to look for geographic variations and if any, to identify potential determinants of access.

Methods:

The analysis is performed on the French health insurance database which covers 97% of the French population. Geographic variations of access are explored, as well as association with the following parameters: demographics (age, sex), socio-economic characteristics (social deprivation index at residence, degree of urbanization), and density of health care services (GPs, neurologists, hospital beds).

Results:

Overall, 112,415 people with MS (70% women, mean age 46 years) were included. Initial results show that over the study period, 98% of patient had at least one visit to GP, 87% to neurologist, and 36% in a CRC SEP.

Conclusions:

The present study will assess to what extent MS patients have been able to take full advantage of an innovative organization of specialized care which was recently deployed in France. This model of care has been generalized by the French Ministry of Health in 2016 and 23 'competence and resource centers' for MS (CRC SEP) are now covering the whole national territory. Further research will be performed to identify whether and how this has modified access to specialized coordinated MS care.

Care trajectories of patients initiating dialysis as planned versus emergency procedure

Maxime Raffray

M Raffray[1], *A Pladys*[1], *F Gao*[1], *C Couchoud*[2], *C Vigneau*[3], *S Bayat*[1]
[1]University of Rennes, EHESP, REPERES - EA 7449, Rennes, France
[2]Registre REIN, Agence de la Biomédecine, La Plaine Saint Denis, France
[3]CHU Pontchaillou, Service de Néphrologie, INSERM, IRSET, Rennes, France
Contact: maxime.raffray@ehesp.fr

Background:

Emergency dialysis is defined as a first dialysis session performed within 24 hours after the nephrologist's assessment due to a life-threatening risk. Starting dialysis in emergency (ES) is associated with poorer outcomes compared to a planned start (PS). The aim of this study was to compare the pre-dialysis care trajectory between ES and PS patients.

Methods:

Patients $\geq$ 18 years old who started dialysis in 2015 in France were included. Data from REIN were linked with the French national health database (SNDS). Individual characteristics at dialysis initiation, inpatient stays (number, duration and diagnosis), and consultations with general practitioners (GP) and nephrologists during the year before dialysis start were compared between ES and PS patients, as well as with national clinical practice guidelines.

Results:

Among 8964 patients included, 30.6% started dialysis in emergency. These patients had more comorbidities than PS patients (19% of ES patients had 3 or more cardiovascular diseases versus 12.6% of PS patients, $p < 0.001$). In the year before dialysis start, ES patients had a lower median number of inpatient stays (1 versus 2 for PS patients, $p = 0.001$) but had a longer mean duration of hospital stay (8.1 days versus 5.8 days for PS patients, $p < 0.001$). ES patients had less consultations with a nephrologist (2.5 versus 4.5 for PS patients, $p < 0.001$). However, the number of GP consultations was not different between the two groups (9.7 versus 9.4 for PS patients, $p < 0.064$).

Conclusions:

Nearly 1 in 3 patients started dialysis in emergency with more comorbidities at baseline than PS patients. Their one year pre-dialysis care trajectory was characterized by less frequent nephrological follow-up and a similar GP follow up, compared with PS patients. These results raise questions regarding access to coordinated care associating GPs and nephrologists. This issue of coordination will be investigated using qualitative methods.

3.I. Round table: Using evidence for action – the story on life-course vaccination

Organised by: EUPHA (IDC), ECDC
Chair persons: Anna Odone - Italy, Karl Ekdahl - ECDC
Contact: michael.edelstein@phe.gov.uk

Vaccination represents a cost-effective public health intervention that saves millions of lives globally each year as well as increasing health and wellbeing of the population. Approximately 20 vaccines are currently in use in routine schedules, with several new or improved in the research pipeline. While immunisation programmes have traditionally targeted children, in recent strategic thinking around vaccination has shifted from an infancy focus to a life course approach that considers the benefits of vaccination at all ages. There are many benefits to targeting different age groups for vaccination, such as targeting individuals at an age that maximises protection (HPV among teenagers, shingles among older adults); boosting waning immunity (Td/IPV among teenagers); protecting at-risk individuals when they are most vulnerable (influenza in pregnancy, pneumococcal vaccine in older adults at clinical risk); protecting newborns in utero before they have the chance to be vaccinated (pertussis in pregnancy); or targeting an older age group to indirectly protect younger infants (MenACWY vaccination of teenagers). Even though the public health benefits of the life-course approach are evident, delivering vaccination programmes spanning such disparate groups represent constant challenges. These challenges can be grouped into: a) limited access to services b) communication challenges influencing attitudes and knowledge of vaccination and c) logistical challenges associated with the use of a wide range of settings for vaccination.

This session will explore, at country and regional levels, experiences and reflections on delivering vaccination across the life course, and evidence-based policy and operational actions taken to deliver an optimal programme at all ages.

Key messages:

- Life course vaccination presents opportunities to better protect the population but also brings unique challenges, both from the patient side and from the health systems side.
- Evidence-based tools and strategies to improve vaccine programmes across the life-course are increasingly available. Country and European level action is needed to achieve optimal results.

Investing in communication education- the example of vaccine hesitancy

Irina Ljungqvist

I Ljungqvist[1]
[1]ECDC, Solna, Sweden
Contact: Irina.Ljungqvist@ecdc.europa.eu

The European Centre for Disease Prevention and Control (ECDC) works on vaccine acceptance by searching for evidence, consulting with key stakeholders (epidemiologists, public health experts, family doctors, non-governmental organisation representatives for Roma, travellers, other under-served population groups), and identifying pilot interventions/ practices.

ECDC aims to strengthen workforce capacity on vaccine acceptance by developing a training for trainers. To guide the development of this multi-annual programme ECDC organised an expert meeting in April 2019 focusing on discussing and designing main elements of the training for trainers in vaccine acceptance at the country level. Key conclusions of the meeting include:

- A range professionals should ideally be trained on how to communicate to increase vaccine acceptance: frontline healthcare professionals, pharmacists, gynaecologists, teachers, politicians, journalists.
- Investments should be made both in postgraduate professional development of frontline healthcare professionals, as well as in university curricula for medical, nursing and teachers training.
- Training should include both knowledge around vaccines and immunization, as well as communication skills to discuss about vaccines and motivate immunization. Possibly legal aspects at the country level should be included, too.
- Vaccine acceptance should be addressed throughout the life course and vaccines.
- Training should be delivered in a blended format, with face-to-face sessions (especially for skills building) and e-learning (especially for knowledge components).
- Training should include a common European-level core but be done by local trainers, in the local language and adapted to the local context.
- Training initiatives should be integrated into a "bigger picture": sustainability of such an initiative should be taken into account, as well as the most efficient and interventions. Seeking synergies and partnerships are key in ensuring long-term success.

Understanding the perspectives of older adults and elderly regarding vaccination; a snapshot in four European countries

Aura Timen

A Timen[1], *R Eilers*[1], *S Lockhart*[2], *R Gavioli*[3], *S Paul*[4], *S Volo*[5]
[1]RIVM, Bilthoven, Netherlands
[2]Pfizer, UK
[3]University of Ferrara, Ferrara, Italy
[4]Universite Jean Monnet, St Etienne, France
[5]Syreon Research Institute, Budapest, Hungary
Contact: aura.timen@rivm.nl

Prevention of infectious diseases in elderly by immunization is a prerequisite to ensuring healthy ageing. However, in order for the vaccine programs to be effective, these need to be provided by health care professionals who have up-to-date knowledge and high motivation. Furthermore, the knowledge and attitudes towards vaccination in the targeted age groups needs to be fully understood. When focusing on the information provision, it is important to know from whom or which institution older adults and elderly would like to receive and in which form.

In January 2019, an international project called the VITAL (The Vaccines and InfecTious diseases in the Ageing population) project was started, within the framework of IMI (Innovative Medicines Initiatives). One of the goals of the VITAL project is to develop strategies to educate and train health care professionals (HCPs) and to promote awareness among stakeholders involved in elderly care management.

We briefly focus on the results of studies undertaken in four European countries (Italy, France, The Netherlands and Hungary), which reveal the perspective of older adults and elderly regarding influenza, pneumococcal, herpes zoster vaccination and respiratory syncytial virus (RSV) as well as generic characteristics of the vaccines and diseases.

We will show how attitudes towards vaccination are represented in our study population and which determinants influence the decision-making process of accepting vaccination. Furthermore, we shall elaborate on how the decision-making process towards vaccination takes place and which additional information is needed.

In the second part of the session, we shall invite the audience to reflect on the findings and identify the factors they consider most important for setting up a training and education programme on vaccination.

Reflections on life-course vaccination: the England experience

Michael Edelstein

M Edelstein[1]
[1]Public Health England, London, UK
Contact: michael.edelstein@phe.gov.uk

Since the introduction of the expanded programme on immunization in the 1970s, vaccination has evolved from being an intervention of early infancy to being a programme targeting individuals at all stages of life including birth, infancy, childhood, teenage years, pregnancy and adulthood. The UK has been at the forefront of this lifelong approach to vaccination and has introduced vaccines at all stages of life in its national schedule, including vaccination against hepatitis B at birth, Meningococcal disease group B in infancy, influenza in primary school years, Meningococcal disease groups A, C, W and Y in teenage years, pertussis in pregnancy and shingles in older adults. Based on a range of studies conducted by Public Health England, This session will reflect on some of the challenges brought on by the life course approach in the UK including issues of access in different age groups, choosing the right age and settings for vaccinations, age-specific attitudes to vaccination and subsequent communication strategies, and challenges with monitoring a life-course programme.

The EU Joint Action on Vaccination – capitalizing on existing knowledge

Jonas Sivela

J Sivela[1]
[1]THL, Helsinki, Finland
Contact: jonas.sivela@thl.fi

Vaccine hesitancy is considered a major global public health threat. Vaccine hesitancy stands for refusing or delaying the acceptance of vaccines, and it is influenced by matters, such as the lack confidence in the system providing the vaccines, inconvenience of vaccination services and individual risk perceptions. In a European context, the lack of confidence is often put forth as major reason behind low vaccine uptake. However, it is equally important to address matters relating to the accessibility and convenience of vaccination services.

The European Council and the European Commission have made several decisions aiming to strengthen vaccine confidence and uptake in Europe. The ongoing EU Joint Action on Vaccination (EU-JAV) is delivering a number of these. As a work package leader for the actions related to vaccine hesitancy and uptake, Jonas Sivelä will talk about the importance of capitalizing on existing knowledge and practices within Europe - and the potential we have in increased cooperation between countries, regions and actors. The EU-JAV develops a systematic overview and analysis of best practices, lessons learned and experiences from vaccine hesitancy and uptake related work. Such work can encompass different types of interventions and practices, for example, training of health care workers, communication policies, or initiatives aiming to increase the accessibility of vaccination services. The EU-JAV creates mechanisms and practical tools for disseminating the knowledge about this work for actors in the public health sector in order to strengthen their possibilities to encounter vaccine hesitancy.

Designing and evaluating an information campaign on HPV vaccination in Denmark

Bolette Soborg

B Soborg[1], *S Jaconsen*[1]
[1]Danish Health Authority, Copenhagen, Denmark
Contact: boso@SST.DK

Vaccinating 12-year-old girls against human papilloma virus (HPV) was included in the Danish vaccination program in 2009. Since 2014 safety concerns resulted in a dramatic decrease in uptake.

In order to nuance the debate, inform parents' decision-making and increase uptake, we launched a national HPV vaccination information campaign in May 2017.

Before designing the campaign, we investigated parents' knowledge, attitudes and decision patterns regarding HPV vaccination. Results showed that 34% parents were vaccine hesitant. Mothers were the primary decision makers regarding their daughters' HPV vaccination, and their primary source of information was online media, particularly Facebook. Finally, parents had a lack of knowledge on several HPV-related facts and a high proportion requested more information before deciding on HPV vaccination for their daughters.

Based on these findings, we designed and launched an information campaign in partnership with the Danish Cancer Society and the Danish Medical Association. The campaign, ''Stop HPV - stop cervical cancer'', was given a designated website and a public Facebook page posting infographics, written case stories, short movies with cases and experts, and updates on vaccination uptake. The overall strategy was to bring back focus on preventing cervical cancer and put faces on the cancer statistics.

Following the campaign, the proportion of hesitant parents and parents against HPV vaccination had declined and 70% of parents were now in favor of HPV vaccination. The number of vaccinated girls had doubled in 2017 compared to 2016 with nearly 31000 girls receiving their first doses. However, the remaining proportion of hesitant parents indicated that they still felt a lack of information and continuously worried about adverse events. Henceforward, effort will be put into guiding hesitant parents to the website and to disseminate the campaign throughout the country by organizing information meetings for parents locally.

3.K. Round table: Liberté, égalité and fraternité in public health - A Human rights approach to Public (Mental) Health

Organised by: EUPHA, EUPHA (PMH), EUPHA (ETH)
Chair persons: Jutta Lindert - EUPHA (PMH)
Contact: mgcarta@tiscali.it

A human rights based approach to Public Health and to Public Mental health offers an opportunity to realize the right to health for all. However, a human rights-based approach to Public Health will require new inter-disciplinary approaches and an innovative frame. This frame should include the use of international human rights standards as a framework for research, policy and practice; the participation of target groups; and the enhancement of inclusion and respect for all. This workshop follows up from the Ljubljana 2018 workshop on human rights and public (mental) health and aims to test the requirements needed to ensure a human rights based approach to public health. For this, a panel of a researcher, ethicist, lawyer and a patient is set up to evaluate three practical cases. What are they advising in these specific cases and what does this mean for the international human rights framework. The outcomes of the panel discussion will be presented by the chair of the workshop.

Case 1:

Coerced sterilization in the UK

The parents of a 21-year old woman with Down's syndrome in the UK contacted a doctor to have their daughter sterlised our of fear that she may become pregnant. The woman did not have a bodyfriend nor expressed an interest in starting a sexual relationship. The parents stated that - as she had grown up - she had become more aware of the opposite sex and could be ''overfamiliar'' with people. Therefore sterilisation was needed to protect her in the future. A specialist supported the parents, but a second doctor suggested various methods of contraception as an alternative.

Case 2:

Euthanasia in the Netherlands

A 74-year old incapacitated women with dementia stated several times that she does not want to live anymore. But she has also been heard saying that she likes her life. Under Dutch law, euthanasia is possible if the patient clearly indicates this, the so-called living-will. In this case, the doctor performed euthanasia based on her living will, which was given years earlier, before she was struck by dementia.

Case 3:

Rape in Northern Ireland

A 12-year-old girl from Northern Ireland is raped. Abortion is not possible in this case due to the strict laws prohibiting abortion unless the woman's life is in danger or there is a permanent or serious risk to her mental or physical health. The girl has to travel to England under police escort to have an abortion, so that a police officer could seize the 'samples' from the procedure for evidence.

Key messages:

- A human rights based approach to Public Health and to Public Mental health offers an opportunity to realize the right to health for all.
- It is critical that we do not risk losing the right to health in the rhetoric of the SDGs and ensure that we respond to the need of improving research methods on the promise of leaving no one behind.

Mauro Giovanni Carta

3.L. Workshop: It's time for timeliness in Health Technology Assessment

Organised by: EUPHA (HTA), EUPHA (HSR)
Chair persons: Chiara de Waure - EUPHA (HTA), Carlo Favaretti - EUPHA (HTA)
Contact: chiara.dewaure@unipg.it

The timeliness of the release of results is one of the most critical issue regarding Health Technology Assessment (HTA) and its potential to support decision-making. This matter may reflect the deep conflict between HTA doers and users. HTA is a form of evidence-based research, expected to timely inform decision-making at several levels - from health policy (macro) to hospital and clinical management (meso and micro) - ensuring accuracy and assessment of both short- and long-term effects of a health technology. HTA purpose therefore is to respond to real world needs, while not overlook a correct methodology. Fast developing health technologies have rapidly spread over the past decades, hence increasing demand for timely assessment aimed at their prompt implementation and management, especially at meso and micro decisional levels. Furthermore, the need for quick answers is emphasized by the pressures placed on policy-makers when a health technology is publicly promoted or contested. Furthermore, an ill-timed assessment can lead to several consequences, among which possible inequalities in access to healthcare. In order to address the challenge of timeliness, organizations involved in HTA should set up models and tools to deliver timely information. The aim of this workshop is to point out the timeliness of HTA as crucial in the decision-making process as a mismanagement of HTA system could be an obstacle to an appropriate healthcare policy. Else more, the workshop would like to critically present examples where research was on time or too late to be included in the decision-making process and elaborate on possible models to successfully deal with timeliness of HTA deliverables in particular at hospital level.

Key messages:

- The timeframe of HTA should ensure the accuracy of information and of methodological and legal steps, without forgetting the timeliness of delivery.
- Models and instruments should be implemented in order to guarantee the timeliness of HTA reports.

Striking a balance between accuracy and timeliness in HTA: an elusive task

Elena Petelos

E Petelos[1,2]
[1]Clinic of Social and Family Medicine, Department of Social Medicine, School of Medicine, University of Crete, Iraklion, Greece
[2]Department of Health Services Research, Care and Public Health Research Institute (CAPHRI) Faculty of Health, Medicine and Life Sciences, Maastricht University, Maastricht, Netherlands
Contact: elena.petelos@med.uoc.gr

Issue:

HTA is a decision-making tool. Users need high-quality and timely evidence to ensure sound resource allocation and timely access to innovation. High-quality HTA recommendations are time-consuming to generate, requiring high-quality evidence and timely evidence synthesis, as well as mechanisms to ensure timely recommendation release and feasible implementation of guidance.

Description of the problem:

HTA submissions, issuing recommendations and implementation guidance oftentimes have no transparent timelines, with high accuracy posing unique challenges for timeliness. We can broadly examine such challenges in the context of methodologies and processes. Accuracy ensures longer-term validity of decision-making, however, HTA should not be used only for new technologies but also revision of previous decisions through timely re-assessment, ensuring obsolete technology disinvestment.

Effects/changes:

Through the exploration of models and tools previously implemented across jurisdictions and settings, such as early-warning systems, conditional approvals and horizon scanning, it will be demonstrated that well-defined prioritisation criteria accepted by both doers and users, adequate capacity and sound preparation of stakeholders are all key elements to ensure the highest possible degree of timeliness and accuracy, and to strike a balance between the two. Particular attention will be paid to critical challenges for public health access and delivery, i.e., emerging technologies and complex interventions, highlighting how horizon scanning ought to start at the discovery, rather than development phase and transparency challenges. Technology tracking and mechanisms for standardizing methodologies and processes will also be discussed.

Lessons:

Monitoring and evaluating the impact of HTA methodologies and processes in a transparent manner needs to become an inherent part of HTA to ensure existing and future challenges of accuracy and timeliness can be adequately addressed.

Why do we need for timeliness of research in decision-making?

Judith de Jong

J de Jong[1,2], *J Hansen*[1], *P Groenewegen*[1,3]
[1]NIVEL, Utrecht, Netherlands
[2]Maastricht University, Maastricht, Netherlands
[3]Utrecht University, Utrecht, Netherlands
Contact: J.deJong@nivel.nl

Background:

Compared to the policy process, the research process is slow. As a result, research evidence is not always available when needed in the policy process. These differences in timelines between research and policy hinder the use of research evidence in the policy process. In order to support evidence-based policy making, timeliness of research is important.

Methods:

Examples are provided, e.g. where research was on time to be included in the policy process and where research was too late to be included in it. These examples are described and analysed to provide for recommendations on how to better align both processes.

Results:

It is shown that in order to create timeliness of research, policy makers and researchers should talk on a regular basis. This increases the chance that results from the research are included in policy making.

Conclusions:

Timeliness of research is important for evidence-based policy making. In order to create timeliness of research, interaction between researchers and policy makers is important.

Sharing hospital-based health technology assessments internationally

Marco Marchetti

M Marchetti[1], *S Daugbjerg*[1]
[1]National Center for Health Technology Assessment, Italian National Institute for Health, Rome, Italy
Contact: marco.marchetti@iss.it

Issue/problem:

National healthcare systems worldwide are at a critical point due to the fiscal sustainability challenges faced. At the same time, healthcare systems are under pressure to meet the global demand for adaptation of medical innovations arriving into the market persistently.

Description of the problem:

Hospitals often serve as the entry point for new technologies to the healthcare system. It is therefore extremely important that Health Technology Assessments (HTA) are available in timely order to accurately inform decision-makers on both short- and long-term effects of a health technology to avoid inappropriate investments. Hospital based HTA (HB-HTA) was developed to accommodate the need for evidence-based hospital-specific information in a timely manner. A substantial increase in the use of HB-HTA has been observed in the last years. However, only few reports are being published. A database for the structured collection of HB-HTA reports could help the dissemination and collaboration between hospitals.

Effects/changes:

A survey answered by an international group of experts knowledgeable in HB-HTA from eighteen different countries has showed that there is an interest to realize the collection and dissemination of HB-HTA reports on an international scale. However, confidentiality and resources for a database are barriers for the dissemination of HB-HTA reports. The challenge will therefore be to overcome these barriers and design a database containing high quality, comparable and complete HB-HTA reports with proper data security, regular maintenance and user support.

Lessons:

International collaboration in HB-HTA is the key to timely inform decision-makers without compromising the quality of the data or the methodology.

3.M. Workshop: Tools and opportunities for health promotion

Organised by: National Institute for Health and Welfare, Finland, EuroHealthNet, EU, JointAction ChrodisPlus, EUPHA (HP), EUPHA (INJ)Chair persons: Caroline Costongs - EuroHealthNet, Anne Lounamaa - EUPHA (INJ)
Contact: anne.lounamaa@thl.fi

Health promotion acknowledges the reciprocal relationship between health-related behaviours and the environments in which people live, considers that the environment is made up of different subsystems and emphasises the relationships and dependencies between these subsystems. Our workshop acknowledges the multi-faceted nature of health promotion and intends to provoke thinking, ideas and tools for health promotion to help to expand skills and knowledge to develop health promotion strategies, policies and interventions.

This workshop will offer examples and provoke discussions on how to develop, evolve and improve health promotion practices. First, an overview of the European health promotion landscape is presented. This information is based on data collection conducted in 2018 in the European Joint Action Chrodis Plus. Next, we have two interlinked presentations to describe how to institutionalize health promotion thorough legislation, assess health promotion actions nationwide, and foster development in municipalities enforced by legislation. These presentations illustrate the developments in Finland, offer examples and highlight the importance of ministerial level actions for health promotion. The nationwide benchmarking system for assessment has existed for over ten years and offers an example for other countries.

The two last presentations address specific health and well-being issues: (1) tobacco control in Portugal and Israel and (2) the promotion of older people's health and well-being in Iceland. The presentation on tobacco control is an example of inter-dependencies of different stake-holders. The presentation from Iceland will stimulate a discussion on how to start and conduct the nationwide implementation of an evidence based health promotion intervention and what the role governments, municipalities, and NGOs should be.

The workshop is a regular workshop. Time for discussion is offered in four spots, (1st) after the first presentation, (2nd) after the second and third presentations, (3rd) after the fourth and (4th) final discussion after the fifth presentation.

Key messages:

- Promising methods for health promotion exist. The challenge is how to implement effectively.
- Legislation is a powerful tool to enhance health promotion practices.

Health promotion and primary prevention in 21 European countries

Andrew Barnfield

A Barnfield[1], *N Savolainen*[2]
[1]EuroHealthNet, Brussels, Belgium
[2]Welfare and Health Promotion Unit, THL, Helsinki, Finland
Contact: a.barnfield@eurohealthnet.eu

It has been estimated that chronic diseases cost EU economies €115 billion or 0.8% of GDP annually. Approximately 70% to 80% of health care budgets are spent on treating chronic diseases. There is a wealth of knowledge within EU Member States on effective ways to prevent chronic diseases and promote health and wellbeing. There is great potential to reduce the burden by making better use of this knowledge as we know that the majority of chronic diseases can be prevented, or their onset delayed.

In order to unlock this knowledge we have compiled health promotion landscape reports from twenty-one European countries involved in the Joint Action CHRODIS PLUS. This paper will present the current actions, policies, and programmes that European countries are currently undertaking in health promotion. It is based on responses to a specially designed questionnaire that asked countries to assess their good practices, identify their gaps and needs, and outline their policy contexts and capacity in relation to health promotion.

This paper makes four key conclusions: (1) health promotion across Europe receives limited attention from policy makers; (2) there is a division between medical and social approaches to health and health in all policies needs to be fully implemented more widely in more countries in Europe; (3) there is not enough funding for health promotion; (4) health promotion needs further operationalisation to facilitate easier monitoring and value assessment.

The need to develop mechanisms to share information, examples of good practice, and support for capacity development in health promotion and primary prevention is a shared goal across European countries. The Joint Action CHRODIS PLUS will lead the effort in implementing good practices, exploring inter- and intra-sectoral collaboration, and encouraging resilient and better informed investment in health promotion and primary prevention. The country reviews and this paper are a first step in that direction.

How to institutionalise health promotion through legislation?

Heli Hätönen

H Hätönen[1]
[1]Department for Wellbeing and Services, Ministry of Social Affairs and Health, Helsinki, Finland
Contact: heli.hatonen@stm.fi

Legislation is a powerful tool to enhance health promotion practices. The aim of this presentation is to describe legislation related to health promotion in Finland. The Finnish Constitution (1999) and the Local Government Act (2015) stipulate every citizen's right to health and wellbeing. Concrete duties and tasks as well roles of different actors are stipulated in detail in the Health Care Act (2010) and many specific acts. General strategic management obligations and tasks of the municipalities have been defined as follows: (1) Municipalities shall assess and take into consideration any effects that their decisions may have on the health and wellbeing of residents. (2) In their strategic plans, municipalities shall identify the objectives and define the measures for health and wellbeing promotion on the basis of local needs. (3) They shall monitor the determinants of health and wellbeing, measures taken and follow-up the health and wellbeing of their residents by population groups. (4) Reports on these shall be drawn up for the municipal council once a year and a more comprehensive review on health and wellbeing shall be produced for the municipal council once during each term of office. (5) They shall assign bodies responsible for health and wellbeing promotion. (6) All departments of the municipality shall work together for health and wellbeing promotion. (7) They shall cooperate with other public local authorities, with private enterprises and non-governmental organisations.

The Health Care Act as well other acts further defines the preventive services that municipalities need to offer. In Finland we have ensured effective implementation of the legislation by number of actions. First, different stakeholders were closely involved to the law-making process from the beginning of the process. Secondly, implementation was, and is still, supported by the National Institute for Health and Wellbeing. Finally, the implementation is systematically monitored.

Assessing health promotion practice in Finland with a benchmarking tool

Timo Ståhl

T Ståhl[1]
[1]Welfare and Health Promotion Unit, THL, Helsinki, Finland
Contact: timo.stahl@thl.fi

The Finnish Benchmarking System for Health Promotion Capacity Building (BSHPCB) is a nationwide system developed to assess structures, capacities and actions taken to develop health promotion practices at local level. BSHPCB data is collected biannually from all Finnish municipalities in the following sectors of administration: primary healthcare, basic education, upper secondary education, vocational education, physical activity and sport, municipal management and culture.

The data collection form and reporting format are based on the theoretical health promotion capacity-building framework, which has seven dimensions that the organization should consider: (1) commitment of the organization to the promotion of population health; (2) management of health promotion; (3) population health monitoring, needs assessment, and evaluation; (4) resources for health promotion; (5) common working practices; (6) public participation/partnership in the planning and evaluation of activities and services; and (7) other core health-promotion functions. Data has been collected since 2010 and results are published on-line (www.teaviisari.fi) within two months of data collection.

The online benchmarking tool serves multiple purposes: first, it provides national actors evidence base for assessing law enforcement and drafting new legislation and developing national strategies and action plans; second it gives regional actors good understanding of municipalities' work and capacities in their region in order to support them and, third municipalities get feedback of their work, are able to benchmark their situation to similar municipalities and develop their health promotion practices. The development and use of BSHPCB has been encouraging. The coverage of the data serves a sound base for further development of the tool. The next steps involve strengthening the quality of the data and auditing practices.

Public health policy implementation and evaluation in portugal and israel (Project PH.PIE): the intersectoral pledge and the case of health literacy for tobacco control in the building of the Homo Salus

Luís Saboga-Nunes

Despite the overwhelming accumulated evidence of the negative effects of nicotine intake, the prevalence of tobacco use is not expected to decline in the near future in several countries. Israel and Portugal both signed the WHO Framework Convention on Tobacco Control (WHO FCTC) and implemented several strategies to achieve Positive Public Health Outcomes (PPHO) (e.g. policy making, legislation). Nevertheless during the past 10 years the number of smokers in Israel has decreased from 28% (in 2000) to about 20.6% (in 2017), while in Portugal, the number of smokers has not changed (2002, 19.2%). However, it has increased for women and adolescents.

The goal of PH.PIE project (Public Health Policy Implementation & Evaluation) is to document policy development and implement Health Impact Assessment (HIA) towards a knowledgeable civic society, searching for the real PPHO. Tobacco control is a selective topic because of its high relevance in public health. PH.PIE considers policy making and stakeholder analysis to comprehend HIA of strategic public health issues and PPHO.

The tobacco industry during the last 10 years has invaded the market with a comprehensive new approach, built around the concept of harm reduction and turnaround strategies to counteract WHO FCTC principles. This way, public health has apparently lost its grip from its own argumentative discourse, while several stakeholders have positioned themselves in the co-working facelift of nicotine use with smokeless tobacco, electronic cigarettes, and other forms of use that have not been scrutinized in terms of their real potential on public health terms.

Harm reduction approaches take the front line, in contrast to smoking cessation efforts as a cornerstone of WHO FCTC. We argue in this paper that health literacy can be critical tool in remaking nicotine addiction in the homo salus upbringing.

Multimodal health promotion – An approach to successful aging

Janus Gudlaugsson

J Gudlaugsson[1,4], *P Jonsson*[2,4], *L Janusdottir*[1], *D Janusson*[1], *A Janusson*[1], *I Gudmundsson*[1], *E Thordarson*[1], *T Aspelund*[1,2,3]

Contact: janus@janusheilsuefling.is

Multimodal health promotion (MHP) is especially relevant for older persons, because of their high rate of disability, functional dependence, and use of healthcare resources. The purpose of this health promotion and research project was to assess the immediate and long-term effects of MHP on functional fitness (FF), body composition (BC), health and quality of live (HQL), and cardio metabolic risk factors (CMRF).

The main objectives of the project are; 1) to promote health of older age groups so they; a) can take part in the future, both better and longer, in the activities of daily life, b) can live longer in an independent residence, c) can prevent or delay entry into residential and nursing homes, d) have the opportunity to work longer in the labor market; 2) to improve the quality of life of older age groups; 3) to reduce government and municipalities expenditures.

The MHP consisted of three 6-month periods with emphasis on daily endurance training and twice-a-week strength training. This was supported by monthly lectures with emphasis on nutrition, use of medicine in connection with training, healthy ageing, mindfulness, goal-settings in old age, endurance, strength and flexibility training, and how to train. The design was a suitable sample with baseline assessment and three 6-month MHP phases.

After each MHP phase, positive improvement was seen in FF, BC, HQL and CMRF. Males and females retained achieved changes and improved further at the end of each 6-month measurement. Our results suggest that regular MHP can improve or prevent decline in functional fitness in older individuals, reduce cardio metabolic risk factors, influence their health and lifestyle and positively affect their ability to stay independent, thus reducing the need for institutional care. MHP is feasible and beneficial in older populations as an integral part of prevention in municipalities and management of chronic age-related disorders.

3.N. Skills building seminar: Learning to assess Health Information Systems - from performance measurements to areas of action

Organised by: InfAct, EUPHA (PHMR), WHO EURO, Sciensano
Chair persons: Neville Calleja - Malta, David Novillo Ortiz - Denmark
Contact: petronille.bogaert@sciensano.be

In order to respond effectively to population health and health systems' challenges, policies must be based on the best scientific evidence derived from sound data and information, and relevant research. Health information systems (HIS), both at national and international level, play an important role in ensuring that reliable and timely health information is available for operational and strategic decision making inside and outside the health sector. How do you know if the HIS in your country is performing well? How can you identify potential areas of action in such a complex and multi-stakeholder system? Previous research has found that there is a great need for capacity-building activities to support strategic development and assessment of HIS.

The World Health Organization (WHO) Regional Office for Europe has created a practical support tool to assist Member States in assessing and developing their national HIS and eHealth systems. The tool covers the domains of resources, indicators, data sources, data management, national HIS data quality/information products, and dissemination and use. Currently, the tool is being used by nine countries in the Joint Action on Health Information (InfAct) to peer review each other's HIS in rotating groups of three countries.

This skill building seminars will start with two presentations to set the scene. First, an introduction will be given on the concepts of a HIS and its core elements, the WHO assessment tool and its current format. Second, experiences will be shared on using the support tool. Thereafter, the participants will choose a domain of the HIS tool in which they are particularly interested and will be split into groups. Each group will carry out a mock exercise of the chosen domain of the tool for their own country. They will identify strengths and weaknesses, and exchange experiences among members of the group on how these have potentially been addressed. Each group will be guided by an expert in the domain with prior experience with the tool. Additionally, based on previous experiences with the tool, a set of commonly found strengths and weakness, followed by recommendations will be prepared to support the group discussions. The skill building session will end by having each group report in a plenary format. The experts from each domain will reconvene in a panel and provide feedback to the strength and weakness, and recommendations that were identified during the group discussions.

Through this skill building seminar, participants will have a clear picture of what a HIS entails. They will be familiarised with an existing HIS assessment tool and how it has been used. Through guided group discussions, they will be able to identify potential elements of action in a specific domain and cross-fertilise with other participants and experts on ideas how to address specific challenges. Finally, they will learn about common strengths and challenges in HIS across Europe.

Key messages:

- Health information from strong health information systems can help Member States identify areas for action to reduce health inequalities, improve health and support the evaluation of measures taken.
- The specific needs for capacity building to run a health information system (HIS) on national, regional or even local level has long been neglected. HIS assessments are one element to close this gap.

The WHO support tool: how is it used and what kind of adaptations are needed?

Nicole Rosenkötter

N Rosenkötter[1], *D Novillo Ortiz*[2]
[1]Public Health Reporting, NRW Centre for Health, Bochum, Germany
[2]Division of Information, Evidence, Research & Innovation, WHO EURO, Copenhagen, Denmark
Contact: Nicole.rosenkoetter@lzg.nrw.de

Issue and method:

In December 2013, the Standing Committee of the Regional Committee for Europe asked the WHO Regional Office for Europe (WHO EURO) to develop a practical tool for Member States that provides assistance in developing and improving national health information systems (HIS) through the development of a national health information strategy.

The developed tool, the Support Tool, was informed by existing tools developed earlier by WHO's Health Metrics Network and was adapted for the planned assessments in the WHO EURO region. The Support Tool was published in 2015 and was used until now for nine national HIS assessment missions.

Results:

By using the Support tool all dimensions of a HIS are assessed: the general resources needed, the indicators used, the data sources available, the applied data management procedures, data quality, and the dissemination process and use of the HIS outputs. The Support Tool structures the assessment process and supports the identification of strength, weaknesses, opportunities, and challenges that inform HIS strategy development in the second stage.

Lessons:

So far, the application of the Support Tool had a strong focus on the assessment stage. It turned out that it is necessary to develop a joint understanding of what a HIS entails. The Support Tool offers great potential to start a structured dialogue with all actors linked to the HIS including policy makers. The assessment provides an opportunity for HIS strengthening and the development of a joint understanding. However, it turned also out that further adaptations of the assessment content are needed to better cover topics prevalent in European HISs, like electronic health records, modern IT-resources, modern reporting approaches, and knowledge translation.

The WHO support tool: what can you learn and how have others experienced it?

Petronille Bogaert

Contact: petronille.bogaert@sciensano.be

Issue and method:

Health information systems (HIS) in Europe are complex and involve multiple stakeholders. To strategically assess HIS, a support tool has been developed by the WHO Regional Office for Europe.

It has been applied in nine countries by WHO Europe since October 2015. Additionally, nine countries are using the tool in a peer review format within the context of the Joint Action on Health Information (InfAct) between January and December 2019. What can you expect to find out during such an assessment? What are countries commonly struggling with? In this presentation, the wealth of experiences using the support tool will be shared and participants will learn about common strengths and weaknesses in HIS across Europe.

Results:

While each country possesses a unique HIS, common strengths and challenges emerge from across assessments. A few major ones will be presented in this session. In many countries promising e-health developments are ongoing such as electronic health records, e-prescription and cloud solutions for data storage. There is a clear desire to shift towards e-health technologies which is a real opportunity. However, well-developed step-wise approaches in interaction with key players are sometimes lacking and sustainability in financing can be of concern. Central multisectoral coordination mechanisms are often lacking, leading to inefficiencies in bringing together data and information, and in the use of financial and human resources. Finally, in many cases data is available, but legal aspects (e.g. impact of General Data Protection Regulation) are limiting the exchange and linkage possibilities for research and monitoring.

Lessons:

HIS assessments help to determine common strength and challenges. By sharing common experiences, participants are better prepared to face common hurdles in their country and will have been exposed to good practices on how to address these.

3.O. Workshop: Social-to-biological processes over the lifecourse and social inequalities in health

Organised by: French National Institute of Health and Medical Research
Chair persons: Michelle Kelly Irving - France, Marc Chadeau-Hyam - France
Contact: michelle.kelly@inserm.fr

Context:

Socioeconomic inequalities in health and ageing are observed across contexts and over time, presenting a challenge for public health. The mechanisms driving associations between social conditions and health include biological responses, which in turn are associated with health outcomes. This workshop aims to describe and discuss evidence on the biological embedding of the social environment from research carried out within a large European consortium, and place it within the context of public health.

Methods:

The Lifepath project was funded by the European Commission between 2014-19 and brought together longitudinal datasets from across Europe, as well as an interdisciplinary collective of researchers keen to examine how social inequalities in health are constructed over the lifecourse. **Results:** Four separate studies are presented here. First, Carmeli et al examine the relationship between social position and systemic inflammation through the mediating role of gene regulation. Second, Fraga et al describe the social patterning of chronic inflammation observed in early adolescence. Third, Castagné et al analyse the relationship between social position across the lifecourse and systemic inflammation, and the role of inflammation within the allostatic load heuristic. Fourth, Chadeau-Hyam et al describe social gradients in a multi-system biological health score, and its subsequent relationship with a number of major health outcomes.

Discussion:

We will coordinate a discussion between the audience and workshop participants. The contribution of the inflammatory system to capturing social inequalities and in its association with chronic disease will be discussed. Is it a key player in the construction of health inequalities, or merely an effective signal for many diverse processes? The role biological markers can play in enhancing our understanding of health inequalities, and how the public health community can respond to the evidence will be discussed.

Conclusions:

Socially patterned biological responses begin early in the lifecourse and may be key factors in the construction of social inequalities in health and ageing. As such, they should be taken into account in public health activities and policy.

Key messages:

- The biological embodiment of social conditions is observed from early life and across the lifecourse.
- Systemic inflammation appears to be a central mechanism which is socially patterned and associated with many health outcomes.

Early life socioeconomic position and adult systemic inflammation: the role of gene regulation

Cristian Carmeli

C Carmeli[1], Z Kutalik[1], M Kelly-Irving[2], C Delpierre[2], M Bochud[1], M Kivimaki[3], P Vineis[4], M Chadeau-Hyam[4], E Dermitzakis[5], S Stringhini[1,6]

[5]Department of Genetic Medicine and Development, University of Geneva, Geneva, Switzerland

[6]Unit of Population Epidemiology, Geneva University Hospitals, Geneva, Switzerland

Contact: Cristian.Carmeli@chuv.ch

Background:

Adverse socioeconomic conditions in childhood affect systemic low-grade inflammation in adulthood. Studies in animals and humans suggest that socioeconomic conditions get under the skin from early life thus contributing to shape pro-inflammatory phenotypes. Although the existence of socioeconomic differences in gene regulation of the immune function have been described previously, no study has so far assessed the extent to which these differences actually explain socioeconomic variations in inflammatory markers.

Methods:

First, we ran 2-sample Mendelian Randomization (MR) methods to identify putative genes whose expression drives C-reactive protein (CRP) levels in blood. We used two databases with summary statistics of associations between single nucleotide polymorphisms and gene expression (eQTLGen, N = 31,486 individuals) and CRP (CHARGE, N = 148,164 individuals) in blood. We tested 10,701 genes and retained those with FDR<0.05. Second, we used individual-participant data from a Swiss population-based study (SKIPOGH, N = 723) to estimate the proportion of the effect of paternal occupational position (SEP) on low-grade inflammation in adulthood (CRP>3mg/L) mediated by the selected genes. We estimated odds ratios and mediated proportions through counterfactual-based mediation models.

Results:

We identified 426 genes driving CRP levels (robust to unmeasured confounding thanks to MR). They jointly mediated the effect of low father's occupation on inflammation in adulthood for a proportion up to about 70% [95% confidence intervals (CI) 11-90%] and with an odds ratio of 1.53 [95% CI 1.05-2.15] compared to individuals with high paternal SEP. Analysis of the effects of life-course SEP trajectories (upward, downward and stable low from paternal to adult SEP) on gene regulation revealed trajectory dependent effects.

Conclusions:

We suggest that adverse childhood SEP affects systemic inflammation in adulthood through a long-lasting effect on gene regulation.

Parental socioeconomic position and chronic inflammation during adolescence

Sílvia Fraga

S Fraga[1,2], M Severo[1,2], E Ramos[1,2], M Kelly-Irving[3], S Silva[1,2], AI Ribeiro[1,2], D Petrovic[4], H Barros[1,2], S Stringhini[4,5]

[5]Population Epidemiology Unit, Geneva University Hospitals, Geneva, Switzerland

Contact: silviafraga14@gmail.com

Background:

Early life adversity has been associated with increased risk of inflammation and inflammation-related diseases in adulthood. This study aimed to examine the association of parental socioeconomic position with chronic inflammation over adolescence.

Methods:

We used information on 2942 members (1507 girls and 1435 boys) of the EPITeen cohort that was established in 2003 in Porto, Portugal, and included 13 years old adolescents that were further evaluated at 17 and 21 years. Mother' and father's education and occupation were used as indicators of parental socioeconomic position. High-sensitivity C-reactive protein (CRP) was measured at three points in time (13, 17 and 21 years). CRP levels were categorized in tertiles separately for each wave; chronic inflammation in adolescence was defined as having CRP levels in the highest tertile in at least 2 waves and never in the lowest tertile.

Results:

Over adolescence, the prevalence of chronic inflammation was significantly higher among participants with low parental socioeconomic position. Low parental socioeconomic position was associated with chronic inflammation in adolescence, after adjustment for sex, perinatal and physical environment factors, health-related behaviours and health status in adolescence OR = 1.63; 95%CI: 1.11, 2.40 for lowest vs. highest mother's education and OR = 1.61; 95%CI: 1.12, 2.30 for lowest vs. highest father's education.

Conclusions:

Low parental socioeconomic position is associated with chronic inflammation during adolescence. Our results suggest that the early life socioeconomic environment has an impact on inflammatory processes over adolescence.

Social patterning of inflammation over the lifecourse and its relationship with mortality

Raphaële Castagné

R Castagné[1], M Chadeau-Hyam[2], M Karimi[2], S Stringhini[3,4], P Vineis[2], C Delpierre[1], M Kelly-Irving[1]

[1]UMR1027 LEASP, Inserm & Université Toulouse III, Toulouse, France

[2]MRC-PHE Centre for Environment and Health, Imperial College London, London, UK

[3]Center for Primary Care and Public Health, University of Lausanne, Lausanne, Switzerland

[4]Unit of Population Epidemiology, Geneva University Hospitals, Geneva, France

Contact: raphaele.castagne@inserm.fr

Background:

This study explores (i) the relationship between socioeconomic position (SEP) across the life course and circulating C-reactive protein (CRP), a marker of systemic inflammation, in 6 European cohort studies (in up to N = 23 008) participating in the Lifepath project and (ii) interrogate the hypothesis of a cumulative biological risk (allostatic load, AL) reflecting 4 physiological systems, including inflammation, potentially predicting future risk of death in one of the cohort.

Methods:

First, we estimated the association between measures of three time point SEP and adulthood CRP, adjusting for health behaviours and body mass index (BMI). To mimic life course experiences, we sequentially adjusted for the chronologically ordered measures of SEP. Next we used mortality data from the 1958 British birth cohort to operationalise AL from 14 biomarkers collected at age 44. Multivariate Cox proportional hazards regression was used to estimate hazard ratios for the association between AL, biological sub-scores and individual biomarkers with mortality.

Results:

Educational attainment was most strongly related to inflammation where low educational attainment was associated with higher log-transformed levels of CRP ($\beta = 0.30$, (0.22-0.38)). Higher AL at 44 years old was a significant predictor of mortality 11 years later (HR = 3.56 (2.3 to 5.53)). Among the four physiological systems, only the immune-inflammatory and cardiovascular sub-scores were significantly related to mortality.

Conclusions:

Socioeconomic circumstances across the life course are associated with higher levels of inflammation in adulthood which in turn predict subsequent risk of death. But our findings also suggest that the cumulative AL measure consisting of all the biomarkers was a better measure for predicting death adding evidence on the biological embodiment in response to chronic stress, suggesting that social-to-biological processes are at play, beyond the impact of health behaviours and BMI.

A socially patterned Biological Health Score and mortality in Understanding Society and UKBiobank

Marc Chadeau-Hyam

M Chadeau-Hyam[1], M Karimi[1], R Castagné[2], B Bodinier[1], C Delpierre[2], M Kelly-Irving[2]
[1]MRC-PHE Centre for Environment and Health, Imperial College London, London, UK
[2]UMR1027 LEASP, Inserm & Université Toulouse III, Toulouse, France
Contact: m.chadeau@imperial.ac.uk

Background:

It now established that social factors impact the quality of ageing, through the lifecourse stimulation/dysregulation of key physiological systems. Composite scores such as allostatic load, focusing on the response to stress, can be used to measure individual physiological wear-and-tear.

Methods:

Using data from the Understanding Society study, a cross-sectional panel study including 9,088 participants representative of the UK population, we defined a synthetic biological health score (BHS) capturing the wear-and-tear of four physiological systems (endocrine, inflammatory, cardiovascular, and metabolic systems), and of two key organs (liver and kidney). We used 16 established blood-derived biomarkers of these systems to calculate the BHS and explored the relative contribution of socio-economic position to the BHS and its main components across age groups. Using data from UK biobank, including over 400,000 UK participants in whom similar biomarkers have been assayed in blood, we sought validation of our results and investigated the role of the BHS on all-cause and disease specific mortality, and disease incidence.

Results:

We identified a systematic decreasing education-related gradient of the BHS ($p < 0{\cdot}001$) leading to lower biological risk in participants with higher educational attainment. Education-related differences in the BHS were detected early in life, and were not attributable to lifestyle and behavioural factors. Analyses of the UK biobank data validated these findings and also showed that the BHS contributed in turn, irrespective of established health risk factors, to all-cause and disease specific mortality.

Interpretation:

Our findings highlight the social-to-biological processes ultimately leading to health inequalities, and suggest that such disparities can already be detected in the 20-40 year age group.

3.P. Workshop: A methodology for monitoring population health literacy in Europe – the HLS19 project

Organised by: EUPHA (HP), Austrian Public Health Institute
Chair persons: Jürgen M Pelikan - Austria, Dietscher Christina - Austria
Contact: juergen.pelikan@goeg.at

Health literacy (HL) is a critical determinant of health (WHO-Shanghai Declaration, 2016), i.e. of healthy life styles, of indicators of health status and of use and results of health care services. For Europe the European Health Literacy Survey (HLS-EU) in 2011 demonstrated, that a considerable proportion of general populations in the researched 8 European countries (and in more countries in later surveys) had limited health literacy and that there was a considerable social gradient of health literacy. The HLS-EU study also showed that HL impacted certain health risks, important indicators of health status and of use of professional health services. But besides these general trends for all researched European countries, there existed considerable variations in distributions and associations of health literacy between the researched countries.

Thus, since knowledge on health literacy of populations is relevant for planning health policy, the Solid Facts - Health Literacy of WHO-Europe (2013) recommended regular monitoring of population health literacy by standardized procedures. Since HL now is understood as a relational concept, HL can be measured on a personal or an organizational systems level. Also measures to improve HL can try to improve personal HL by offering better opportunities for learning or by developing Health Literate Organizations or settings to be more sensitive to personal HL of their users and be less demanding and more supportive for users.

Therefore in 2017 the Action Network on Measuring Population and Organizational Health Literacy (M-POHL) was initiated under the umbrella of the European Health Information Initiative (EHII) by WHO-Europe. M-POHL from its beginning combines a policy with a research agenda. About 25 member states of WHO-Europe already joined M-POHL. As a first project the European Health Survey 2019 (HLS19) is ongoing with 15 countries participating.

The workshop will inform about the vision and mission of M-POHL, about the methodology of the on-going HLS19 survey and about the way selected countries are using monitoring of HL for their health policy. Following 5 short inputs (60′), including two more general ones M-POHL and HLS19 and three on perspectives from countries, participants will have the opportunity (30′) to ask questions and discuss what M-POHL and HLS19 means or could mean for health policy of their country and their personal research or policy interests.

Key messages:

- Health literacy is a critical determinant of health which has to be monitored for general populations in all countries of WHO-Europe as a basis for national and European health policy.
- The Action Network of Measuring Population and Organizational Health Literacy (M-POHL) of WHO-Europe has started the Health Literacy Survey 2019 to provide data for evidenced-based health policy.

A methodology for monitoring population health literacy in Europe – the HLS19 project

Jürgen M Pelikan

J Pelikan[1], P Nowak[1], J Bobek[1]
[1]Helth Promoting Hospitals, The Austrian Public Health Institute, Vienna, Austria
Contact: juergen.pelikan@goeg.at

Health literacy (HL) matters for health of people and for use and results of health care. Therefore knowledge on HL is relevant for evidence based health policy. But there is evidence on considerable variation of distributions and associations of HL between European countries. Furthermore HL is impacted by health promotion and health care policy interventions. Therefore it makes sense to monitor HL in each European country on a regular basis in a standardized form that allows for benchmarking between countries. A first European Health Literacy Survey (HLS-EU) in 2011 in eight member states supported by the European Commission introduced measurement of population HL in Europe. Based on the results of this survey WHO-Europés ''The Solid Facts - Health Literacy'' (2013) recommended institutionalized regular measurement and monitoring of HL.

To implement this recommendation in 2017 the Action Network on Measuring Population and Organizational Health Literacy (M-POHL) was initiated under the umbrella of the European Health Information Initiative (EHII) by WHO-Europe, with already 25 countries participating. From its beginning M-POHL combined a policy with a research agenda and developed a documents on it vision and mission: The Vienna Statement on the measurement of population and organizational health literacy in Europe (2018).

As a first project the European Health Literacy Survey 2019 (HLS19) has been planned and implemented. Based on the comprehensive concept and definition of population HL and the design and questionnaire of the HLS-EU study a common study design and a further developed instrument has been developed by representatives of 15 participating countries. Most import measurement of digital HL has been included into the HLS19 study and a new short form HLS-Q12 of the HLS-EU47 has been constructed. The presentation will give an overview on the research questions, the design and the instruments, the pretesting and the data collection of HLS19.

Using data on population health literacy as a basis for evidence-informed health policy

Christina Dietscher

D Dietscher[1]
[1]Health Promotion, Austrian Ministry of Labour, Social Affairs, Health and Consumer Protection, Vienna, Austria
Contact: christina.dietscher@sozialministerium.at

An increasing body of evidence suggests that health literacy (HL) is relevant for health-related decisions in relation to treatment, prevention, and health promotion and, consequently, for health and health care outcomes. At the same time, data illustrate that huge proportions of populations in many countries are concerned by low levels of HL. The improvement of HL should therefore be an issue of concern for health policy. In the sense of ''what doesn't get measured doesn't get done'', internationally comparative data on HL - like those provided by HLS-EU (2011) - can provide important guidance for health policy and administration on where best to intervene. Austria is one of the eight countries that participated in HLS-EU. According to the data analysis, the percentage of the Austrian population affected by low levels of HL came second-to-last in the survey. This was a wake-up call for Austrian health policy, and numerous activities were initiated as a result.·

In 2012, Austria launched a national health target on improving population HL. Since 2013, specific objectives to improve HL have been integrated into the ongoing national health care reform process. In 2015, a national HL alliance was launched to coordinated activities. Today, the alliance has 5 defined program lines that are in huge parts inspired by the analysis of HLS-EU data, and Austria will participate in the next European HL survey starting in Autumn 2019 to get new data.

The examples of other countries - including those represented in the workshop - confirm the importance of internationally comparative data to trigger national attention and to start coordinated action on HL. According to the Austrian experiences so far, data analysis can support evidence-informed action in defined fields of activity. To remain active in a continuous and systematic way requires national capacity-building as well as the identification of and collaboration with stakeholders across sectors.

Using survey data on population health literacy for developing a National Action Plan in Germany

Eva-Maria Berens

E Berens[1], *D Schaeffer*[1]
[1]Faculty of Health, University of Bielefeld, Bielefeld, Germany
Contact: eva-maria.berens@uni-bielefeld.de

Promoted by the results of the European Health Literacy survey, the first representative German Health Literacy Survey (HLS-GER) was conducted in 2014. The results showed that every second individual in Germany (54.3 %) has limited health literacy. Thus, a majority of the German population is confronted with difficulties in finding, understanding, appraising, and applying health information. Particularly, vulnerable groups as people with migration background, low education attainment, and in older age as well as chronically ill have even more problems in processing health information and thus are confronted with challenges to maintain health, prevent diseases and use the healthcare system.

Based on the initial research findings of the HLS-GER and the increasing attention and discussions arising with its results, the National Action Plan Health Literacy was developed by a group of experts to systematically improve and strengthen health literacy in Germany. After agreements with representatives of politics and society, health professions and patient and citizen organizations it was published in 2018. It includes 15 specific recommendations in four areas of action and focusses on fostering health literacy in daily life, creating a user-friendly and health literate healthcare system, HL and chronic illness and expanding health literacy research. Five underlying key principles are mentioned to consider in implementing the National Action Plan. The HLS-GER survey data were further used to discuss some recommendations within specialized workshops leading to more detailed strategy papers. The current political and practical developments and discussions initiated by National Action Plan, will be picked up in the second German Health Literacy Survey (HLS-GER2), which is part of HLS19. By repeatedly assessing population HL in Germany the implementation of the National Action Plan can be monitored and further specified, thus survey data help to create policy.

WHO Action Network on Measuring Health Literacy: the Italian pilot for the Survey 2019 Title

Luigi Palmieri

L Palmieri[1], *A Rosano*[2], *C Cadeddu*[1], *C Donfrancesco*[1], *D Galeone*[3], *V Mastrilli*[3], *R D Elia*[3], *C Lo Noce*[1], *A Acampora*[4], *S Giampaoli*[1]

[3]Ministero della Salute, Ministero, Rome, Italy
[4]Università Cattolica del Sacro Cuore, Rome, Italy
Contact: luigi.palmieri@iss.it

Background:

Health Literacy-HL is an important determinant to improve and maintain health and quality of life during life course. HL implies people's knowledge, motivation, competencies to access, understand, appraise, apply information to make judgements and decisions in everyday life concerning healthcare, disease prevention, health promotion. Thanks to Ministry of Health funds, Italy joined the WHO Action Network on Measuring Population and Organizational Health Literacy-M-POHL for collecting comparable data on HL in order to measure and promote citizens' HL among MS.

Objective: The HLS-EU-Q16 questionnaire was administered to a sample of adult population during the Health Examination Survey-HES of the CUORE Project started in 2018, to verify and evaluate the feasibility of the HL survey.

Methods:

One hundred people aged 35-74 years, resident in Reggio Calabria (South of Italy), were interviewed (face-to-face) following consecutive access to the HES. According to the HLS-EU-Q16 sum score, three levels of HL were defined: inadequate, problematic, and sufficient. HL mean score and standard deviation-SD were elaborated together with prevalence of the three HL levels. Socio-demographics conditions, lifestyles, risk factors were measured during the HES.

Results:

HL mean score of 98 completed questionnaires (47 men, 51 women) was 13.0 (SD = 3.5), with no sex difference; prevalence of persons with inadequate HL was 11.2%, problematic 26.5%, sufficient 62.3%. Sufficient HL level presents the highest prevalence (72%) of high educational level. Smoking habit decreases as HL level increases.

Conclusions:

The HLS-EU-Q16 questionnaire represents a standardised tool applicable in the general population. Preliminary results from the Italian pilot of the HLS-EU-Q16 suggest that the survey is feasible within the HES of the CUORE Project, with the opportunity to link HL data with HES measured data. More than one third of interviewed adult population have inadequate/problematic HL.

Italian participation to the WHO action network on measuring health literacy: policy implications

Chiara Cadeddu

C Cadeddu[1]*, L Palmieri*[1]*, D Galeone*[2]*, V Mastrilli*[2]*, R D'Elia*[2]*, A Rosano*[3]
[1]Istituto Superiore di Sanità (ISS), Rome, Italy
[2]Ministero della Salute, Rome, Italy
[3]Istituto Nazionale per l'Analisi delle Politiche Pubbliche, INAPP, Rome, Italy
Contact: chiara.cadeddu@iss.it

Issue:

Health literacy (HL) is recognized as a determinant, mediator or moderator of health and of use and results of health care services Inadequate HL is associated with patient disengagement, inappropriateness of care, increased health care costs, and higher mortality rates.

Description of the problem:

Few previous studies suggested that inadequate HL is a prevailing problem in Italy. As compared with the European Countries, Italy has peculiar characteristics of socio-demographic determinants of HL levels, which constitute a challenge for policy making. In so far HL has not been considered as a strategic priority for the Italian National Health Service. The Italian National Institute of Health and Ministry of Health are promoting a national program on HL by adhering to the WHO action network on measuring population and organizational health literacy (M-POHL). Main aim of the program is to propose policies that could enable all citizens to share the benefits of improved HL. A national population survey, coordinated at European level, has been planned in each participating country in 2019.

Preliminary results:

We are setting up the survey using the questionnaire with 47 specific questions about HL and 32 about lifestyles and demographic characteristics. Updated results of this survey will be analysed in order to define a strategic line for the implementation of actions for the improvement of HL in the next National Prevention Plan. Furthermore, the national survey will be scheduled and repeated to monitor results.

Lesson State:

Policies can be implemented at individual, community, organization or system level. Italy is at the beginning of its experience in this field. A national steering committee of experts has also been appointed to support HL policy initiatives. The comparison with existing policies in other countries within the M-POHL action will be another asset to develop HL policies and related activities to benefit citizens, patients and communities.

3.Q. Skills building seminar: How to make the case for advocating for investment in wellbeing and health equity

Organised by: EUPHA, WHO Collaborating Centre Investment for Health and Wellbeing, WHO EURO, WHO RHNChair persons: Natasha Azzopardi Muscat - EUPHA, Francesco Zambon - WHO EURO
Contact: mariana.dyakova@wales.nhs.uk

Current investment policies and practices are unsustainable, resulting in high costs to individuals, communities, countries and our planet. Substantial evidence demonstrates that investing in evidence-informed, cross-sector, fair public policies and interventions brings multiple benefits, which drive social, economic and environmental sustainability. Making the case and advocating for investment in wellbeing and health equity is essential to enable evidence-informed sustainable and fair policy and action for the benefit of people, communities, societies, the economy and the planet. This skills building seminar intends to focus on the practical approaches, methods, considerations and examples of how to make the case for sustainable investment in wellbeing and health equity.

Specific objectives include:

- Improve understanding and build skills for making an 'investment case'
- Help key stakeholders, advocates, civil servants and other health/non-health professionals to inform, influence and shape national / sub-national investment policies and practices
- Provide an overall picture as well as an insight into the key stages, stakeholders, resources and skills needed to develop an advocacy product (report/infographic/etc.)
- Highlight the use of health economics, especially new methods and tools to capture the value (returns) to society, economy and the planet - the Social Return on Investment (SROI)
- Share practical experience of advocating for, driving or implementing sustainable investment / finance approaches for health and equity
- Support the implementation of the Sustainable Development Goals (2030 Agenda) and the WHO European Health Equity Status Report Initiative in the European Region.

The seminar will consist of two in-depth presentations, having a ''how to...'' focus. This will be followed by a panel discussion, sharing experiences and insights and showcasing examples of approaches used, practical aspects and considerations of the 'investment case'. The discussion will include key elements of evidence mobilisation and synthesis; project planning and key stakeholder involvement; using health economics methods and tools; communicating and advocating effectively, using data and visualisation; and assessing and enhancing impact. We will try to look 'behind the scenes' in order to improve knowledge, understanding and capacity about user needs; the routines involved and the techniques, skills and resources required; and why would policymakers listen; and what would make them listen and act.

There will be continuous audience engagement through live polling (e.g. Mentimeter) and Q&A time.

Key messages:

- Evidence-informed rights-based investment for wellbeing and health equity brings social, economic and environmental returns, driving sustainable development and prosperity for all.

- Advocating for sustainable investment policy and action requires a systematic process of evidence synthesis, stakeholder involvement, impactful communication, monitoring and evaluation.

Step-by-step process of making the case for sustainable investment in wellbeing and health equity

Mariana Dyakova

M Dyakova[1], K Ashton[1], A Stielke[1], MA Bellis[1]
[1]WHO CC on Investment for Health and Well-being, Public Health Wales, Cardiff, UK
Contact: mariana.dyakova@wales.nhs.uk

Issue:

Urgent action is needed to address the growing health, inequity, economic and planetary challenges that threaten the wellbeing of present and future generations. Business as usual has proven unsustainable with high human, social, economic and environmental costs. Coordinated policy action on the determinants of health combined with well-designed and implemented governance and innovative investment approaches can have a dual effect: a) reducing the health gap; and b) improving overall population health.

Description:

The WHO Collaborating Centre on Investment for Health and Wellbeing has developed a practical step-by-step guide, outlining the process of how to synthesise, translate and communicate public health and economics evidence into policy and practice, in order to make the case for investment in wellbeing and health equity. It aims to: 1) prevent disinvestment in health; 2) increase investment in prevention / public health; and 3) mainstream cross-sector investment to address the wider determinants of health and equity, driving prosperity for all.

Building on the Knowledge-to-Action framework and an extensive international multi-disciplinary consultation, four key phases are described: 1) Project scoping and planning; 2) Evidence gathering, synthesis and design; 3) Dissemination and communication; and 4) Monitoring and evaluation. Key messages, different products and a number of practical tools and tips are highlighted. An essential element is using health economics approaches and tools to build the case, showing the burden of inaction in parallel with available sustainable solutions, which can bring 'social return on investment'.

Results/Lessons:

The result of the above-described process is the development of evidence-informed, context-tailored advocacy documents and tools, enabling healthy policy- and decision-making across different sectors, levels of government and country settings.

Tools and approaches towards sustainable investment for health equity

Tatjana Buzeti

T Buzeti[1], C Brown[1]
[1]European Office for Investment for Health and Development, WHO, Venice, Italy
Contact: buzetit@who.int

Issue:

The drive to deliver better results for the economy and for society is challenged by the daily pressures faced by policy makers to contain the public expenditure while delivering improved outcomes. This is evident also in the health sector where costs are perceived to be spiralling. As a result, the sector faces huge pressure to cut budget and services. On the other hand, the health sector is a minor contributor towards health equity, as social, economic and environmental determinants of health are mostly responsibility of other sectors. Health equity and well-being are outcomes of societal values, culture and policy choices, that create the conditions for prosperous lives for all, leaving no one behind.

Description:

There are different approaches and tools that can be used for advocating, planning and monitoring investments for health equity. To name a few that the health system can introduce: mainstreaming equity into health services, employment, procurement and purchasing practices for better social and economic benefits; Health Equity Impact Assessment that supports implementation of Health Equity in All Policies and Agenda 2030; voluntary national review reporting on SDGs - all stressing the need for disaggregation of data, new evidence and methods, and monitoring.

Results/Lessons:

Health equity is a complex issue that needs comprehensive response combining various approaches and tools in advocating, planning, implementing and monitoring. Besides situation analysis, more and more WHO Member States are requesting evidence about what works and how to do it. Therefore, tailor made assessment, solution development and monitoring is becoming a standard. This needs to be supported with continuous training and capacity building. WHO European Office for Investment for Health and Development developed a Health Equity Status Report and a flagship course on Equity in Health in All Policies, built on the latest evidence and tailored to country / community needs.

4.A. Health disparities

Visualising the complex relationships between ethnic group and health in Scotland: 2001-2013

Laurence Gruer

L Gruer[1], F Stanaway[2], R Bhopal[1]
[1]Usher Institute of Population Health Sciences & Informatics, University of Edinburgh, Edinburgh, UK
[2]School of Public Health, University of Sydney, Sydney, Australia
Contact: gruer.health@gmail.com

Background:

With growing numbers of migrants worldwide, accurate data are needed to assess the health of migrants and ethnic minorities, highlight inequalities and evaluate relevant policies and actions. To summarise and reveal the complexity of the findings, we developed data visualisation techniques based on epidemiological principles.

Methods:

We used published results from the Scottish Health and Ethnicity Linkage Study (SHELS), a retrospective cohort of 4.62 million people linking census ethnicity data to health service and death records during 2001-2013. In tables mainly using rate ratios, we employed different colours to show health advantage, disadvantage or equivalence; different colour shades to represent degree of certainty, combining effect size and precision of estimate; and different font sizes for absolute rates, to highlight more common conditions. We ranked health conditions by age-adjusted rate within each ethnic group to show differences in burden of disease and disease priorities.

Results:

Using 30 health outcomes for up to 11 ethnic groups, we show that ethnic differences vary greatly depending on outcome, sex and ethnic group. The patterns are complex with some ethnic groups showing strong advantages for some outcomes and strong disadvantages for others. Using absolute rates highlighted differences in common conditions such as myocardial infarction, COPD, and falls. Ranking conditions within ethnic groups showed that most ethnic groups have largely similar disease priorities.

Conclusions:

Our approach helps reveal and interpret the complexity of ethnic health differences. Simplistic generalisations that the health of migrants or ethnic minorities is worse or better than majority populations are often misleading and best avoided. Using absolute rates and ranking conditions within ethnic groups are useful as large relative differences in disease rates between ethnic groups may not translate into different disease priorities.

Key messages:

- Statements that the health of migrants or ethnic minorities is worse or better than majority populations are often misleading and best avoided.
- Large relative differences in disease rates between ethnic groups may not translate into different disease priorities.

Mobile clinic approach towards hard-to-reach populations' health in Roman suburban settings

Alice Corsaro

A Corsaro[1], R Marotta[2], DF Angelone[2], FS Biagiarelli[2], F Terenzi[2], A Zampa[3], E Buonuomo[3], MC Galizi[1], F Giuffrida[1], R Giampaolo[2]

[1]Health Management Office, OSA Associated Health Workers Cooperative, Rome, Italy

[2]Bambino Gesù Children's Hospital, Rome, Italy

[3]Comunità di Sant'Egidio, Rome, Italy

Contact: alice.corsaro12@gmail.com

Among other vulnerable populations, Sinti and Roma ethnicity people are the ones more likely living in precarious housing conditions such as settlements, especially in Roman suburban and deprived neighbourhood. These hard-to-reach communities usually present poor health outcomes and reduced life expectancy. Since 2016, the project Nontiscordardimé (a partnership of Bambino Gesù Children's Hospital, OSA Health Workers Cooperative and Vicariatus Urbis) provided 3 outreach per week in two different peripheral settings ensuring to children specialized visits, nutritional screening, growth monitoring and vaccinations by means of a mobile clinic. When necessary, second level examinations have been arranged in the hospital. Personal data, detected pathologies and services provided have been collected from January 2016 to December 2018.

Main diseases detected during 2.226 examinations in Gipsy settlements were respiratory infection (26,3%), skin infection and parasitosis (13.3.%). Moreover 7,5% of visited children had malnutrition and 3,4 % presented oral hygiene related issues. Only 40% of planned second level examination and only 51% of planned hospital admission have been carried out. During outreach in parishes of suburban areas, 1.411 examinations have been performed, encountering mostly respiratory disease (30%), asthmatic bronchitis (8%), dermatitis (5,8%) and allergic rhinitis (3,8%). Adherence to hospital examination and admission reach respectively 72% and 85%.

Poor housing, isolation and overcrowding are significant barriers to prevention and health care even if the national health system provides universal coverage, and free care. Indeed disease prevalence in gipsy settlements was mainly related to socio-economical and housing condition (poor hygiene, overcrowding) whereas others peripheral urban setting, even when deprived, showed an epidemiological framework close to the general population where asthmatic and allergic disorders are prevalent.

Key messages:

- Mobile clinics can close the gap between health services and disadvantaged children and hard-to-reach populations.
- Outreach can be a mean of promotion, prevention and health services inclusion.

ED visits and hospital admissions of foreigners for psychiatric disorders in Rome from 2007 to 2018

Angelo Nardi

A Nardi[1], G Migliara[1], A Angelozzi[1], S Caminada[1], M Giffi[1], C Isonne[1], FA Pirro[1], G Bertazzoni[2], P Villari[1], C De Vito[1]

[1]Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy

[2]Emergency Department, Umberto I - Policlinico di Roma, Rome, Italy

Contact: angelo.nardi@uniroma1.it

Background:

First generation immigrants are at high risk of psychiatric disorders (PD). Moreover, cultural and migration related factors can act as barriers in the access to care. The aim of this study was to analyze the emergency department (ED) visits and the subsequent admissions to Umberto I, a large teaching hospital in Rome, for PD from 2007 to 2018 and to highlight the differences between Italian citizens and foreigners.

Methods:

Adult patients were divided in 11 Nationality Groups (NGs). Basing on ICD9 codes, PD were classified in 5 categories: psychotic, mood, anxiety, personality and substance abuse disorders. Descriptive statistics were conducted for gender, age, educational level and triage. Poisson regression models, adjusted for sociodemographic variables, were used to estimate incidence rate ratios (IRRs) of different NGs, both for visits and hospital admissions, for the five psychiatric categories and for PD as a whole.

Results:

In the period of interest there were 11,965 ED visits for PD, of which 19.2% made by foreigners. Compared to Italians, all NGs showed higher percentages of ED visits for PDs, except for Southern Asian (SA) and East-Southern east Asian (ESA); SA and ESA, together with Other Africa population, showed also higher proportion of psychosis. Regarding admissions, ESA had the highest percentage overall, while more than half of foreigner nationality groups had higher percentages of admissions for psychosis than Italians. Poisson regressions showed that only EU citizens have greater risk of ED visit (IRR 1.69, IC95% 1.46-1.96) and of hospital admission for PD (IRR 1.23, IC95% 1.02-1.49) than Italians, while Romanians, SA and ESA have lower risk.

Conclusions:

Different risk in ED visits for PDs among NGs can be due to heterogeneity in psychopathology, cultural factors, barriers, and migrant status. More studies are necessary to better understand the needs of foreigners and to enhance their mental health service use.

Key messages:

- The risk of ED visit and hospital admission for psychiatric disorders differ among foreign populations.
- Different study design are needed to understand which cultural and migration related factors influence the risks, in order to provide more tailored mental health services for high risk populations.

Sleep problems among immigrants

Marte Kjøllesdal

C Øien-Ødegaard[1], M Straiton[1], MKR Kjøllesdal[2]

[1]Division of Mental and Physical Health, Norwegian Institute of Public Health, Oslo, Norway

[2]Division of Health Services, Norwegian Institute of Public Health, Oslo, Norway

Contact: MarteKarolineRaberg.Kjollesdal@fhi.no

Background:

The prevalence of insomnia has increased from 11.9% to 15.5% between 2001 and 2011. At the same time, there has been a strong increase in immigration, and today immigrants constitute about 14% of the population. However, we do not know if these increases are related. There is limited information about immigrants' mental health problems, and more specifically, their sleep problems. There is an established association between low socioeconomic status and higher chance of experiencing sleep problems, and we aim to investigate if this also is the case for immigrants in Norway, and whether being an immigrant is a risk factor.

Methods:

Using the Living Conditions Survey for Immigrants 2016, we conducted logistic regression analyses to investigate associations between sleep problems and socioeconomic status among immigrant groups. We also preformed analyses comparing the results for immigrants as a whole and the majority population.

Preliminary results:

The analysis indicates a strong relationship between socioeconomic status and sleep problems for immigrants and the majority alike, but also a strong moderating effect of being in the majority population. Women have higher odds of experiencing sleep problems than men, but the odds are much higher for immigrant women than for majority women. When taking origin country into the analysis, we see that only 3 of 12 countries have significantly different odds than the majority. Men from Iraq and Iran have particularly higher odds, while Eritrean women have lower.

Conclusions:

Sleep problems are associated with other mental health problems, unemployment, substance abuse and increased mortality. Our finding, that immigrants have higher odds of sleep problems, is something medical professional and teachers should be aware of. Several barriers need to be addressed to increase the level of help seeking. This includes enhanced access of health information, and availability of mental health services.

Key messages:

- Immigrants have higher odds than the majority population for experiencing sleep problems, also when controlling for socioeconomic status.
- Immigrant women are particularly exposed to sleep problems, although there are considerable variations according to country of origin.

Immigration status and cervical test screening: more underscreening and inequality social health

Jeanne Sassenou

J Sassenou[1], *L Rigal*[1], *V Ringa*[1]
[1]1018, INSERM, Villejuif, France
Contact: jeanne.sassenou@hotmail.fr

Introduction:

In France, public health authorities recommend cervical cancer screening (CCS) by a Pap test every 3 years for all sexually active women aged 25 to 65 years. Socioeconomic inequalities are observed in CCS and disparities in screening practices according to immigration status has been reported. The aim of this study was to compare income inequalities in cervical screening depending on immigration status.

Methods:

The study was based on the 2012-2016 baseline data in the Constances cohort (N = 28905 women). Delayed CCS was defined by having last CCS for more 3 years. The main independant variables were monthly household income and immigration status. The women's origin was divided into the following categories: French women born to two French parents (French origin), French women born to at least one foreign parent (immigrant origin), and women born to two foreign parent (immigrants). Immigrants were divided into two categories: women with French or not nationality (naturalized or foreign immigrant). The slope index inequality (SII) was computed to measure the income inequality in CCS non-adherence. Interaction test was used to compare SII depending on immigration status. We used imputation model.

Results:

We confirmed the existence of a gradient with respect to migration origin for delaying CCS (21,9 % women of French origin, 26,5 % women of immigrant origin, 28,8 % immigrant, $p < 10\text{-}4$). More income inequalities were observed depending on immigration status (SII French origin = 0,17 [0,16-0,18], SII immigrant origin = 0,28 [0,24-0,32], SII immigrant = 0,27 [0,25-0,31], p interaction <0,001). Among immigrant women, we observed difference in social inequalities depending on French nationality (SII naturalized = 0,19 [0,15-0,23], SII foreign immigrant = 0,35 [0,30-0,40], p interaction <10-4).

Conclusions:

French women of immigrant origin and immigrant women are underscreened and social inequalities are stronger among them than French women of French origin.

Key messages:

- French women of immigrant origin and immigrant women are less detected for cervical cancer screening than French women.
- French women of immigrant origin and immigrant women are detected for cervical cancer screening with more social inequalities than French women of french origin.

Risk of macrosomia and low birthweight among immigrants in Belgium, a perfect mirror?

Judith Racape

J Racape[1], *M Sow*[2,3], *C Schoenborn*[2], *M De Spiegelaere*[2]
[1]Faculty of Medicine, Université Libre de Bruxelles, Brussels, Belgium
[2]Research Centre in Health Policies and Health Systems, Université Libre de Bruxelles, Brussels, Belgium
[3]School of Public Health, Université de Montréal, Montreal, Canada
Contact: jracape@ulb.ac.be

Background:

Both low birthweight (LBW) and macrosomia are associated with increased risk health conditions but risk factors of macrosomia among immigrant are understudied. One hypothesis is that some migrant groups at high risk for LBW have correspondingly low risk for macrosomia, and vice-versa. Our objective was to analyze LBW and macrosomia among immigrants according to naturalization, time since naturalization and socioeconomic status in Belgium.

Methods:

The data came from the linkage between the Brussels birth and death registers, the national register of migrant trajectories and the social security register for the years 2004-2010. We used logistic regression to estimate the odds ratios of the associations between LBW and macrosomia according to maternal nationality and time since naturalization, taking into account socioeconomic status (SES), parity and maternal age.

Results:

Data relate to all singleton births among Belgian, Maghrebi, Sub-Saharan African and Turkish women (n = 76 312). Compared to Belgians, we observed lower risk of LBW but higher risk of macrosomia among Maghrebi women ($p < 0.0001$). Among Turkish and Sub-Saharan African mothers the risk of LBW is higher than the Belgian ($p < 0.001$) but the risk of macrosomia is similar to Belgian mother. The results show a U-shaped increase of LBW and decrease of macrosomia with time since naturalization for all migrant groups. Results did not change after adjustment with maternal characteristics and SES. In parallel, we observe an improvement of SES among all migrant groups.

Conclusions:

Our results show an increase of LBW rates and a decrease of macrosomia among Maghrebi, Sub-Saharan African and Turkish women with time since naturalization. The risk of macrosomia completely mirrors the risk of LBW for Maghrebi mother but not for Sub-Saharan African and Turkish women. Further studies would help to better explain risk factor and social determinants of macrosomia among immigrant.

Key messages:
- We observed an increase of LBW but a decrease of macrosomia with time since naturalization among immigrants.
- Patterns of macrosomia do not completely mirror those of LBW among different migrant groups.

Promoting sexual health literacy among migrants in Sweden

Pia Svensson

P Svensson[1], K Carlzén[2], A Agardh[1]
[1]Social Medicine and Global Health Department of Clinical Sciences, Lund University, Malmö, Sweden
[2]Department of Social Sustainability, County Administrative Board of Skåne, Malmö, Sweden
Contact: pia.svensson@med.lu.se

Background:
Migrants constitute a growing share of the European population. Refugees and migrants in Europe have a higher risk for poor sexual and reproductive health than the native-born population. These differences can be explained by limited access to sexual health care, family planning and prevention.

Newly arrived migrants in Sweden are offered a programme encompassing civic orientation provided in mother tongue by communicators. MILSA web-based education platform aims to secure a national standard for civic orientation. Over a three-year period, 200 communicators across Sweden will receive training. This study will explore civic orientation as an arena for health communication, and the role of the communicators for delivering sexual health information. It will identify active components for the delivery and uptake of sexual health information.

Methods:
Qualitative in-depth interviews were conducted with nine migrant women during their resettlement, and with twenty communicators participating in MILSA education platform.

Preliminary results:
- Receiving information in mother tongue by communicators with cultural competence increases access to information. Shared understandings of shame and stigma associated with sexual health constrain the quality of delivery and uptake.
- Leadership, pedagogic skills, cultural competence, and responsiveness to target group are important qualifications for the communicators.
- Communicators need an understanding of both cultures, how they interact, and the influence of migration on cultural identity to deliver SRHR information.
- Trust among participants, and between the communicator and participants is essential for the delivery and uptake of sexual health information.

Conclusions:
Building competence to deliver sexual health information among professionals who encounter migrants at an early stage in the resettlement has the potential to build sexual health literacy and reduce barriers to accessing sexual and reproductive health.

Key messages:
- Civic orientation is an important arena for reaching migrants with SRHR information.
- To empower the migrants to take control of their sexual and reproductive wellbeing in the new country, this information must be culturally, linguistically appropriate and delivered pedagogically.

Refugee Escape Room©: a new gamification tool to deepen learning about Migration and Health

Núria Serre-Delcor

N Ruben Moreno[1], L Wylie[2], N Serre-Delcor[1,3]
[1]MyHealth Project, Vall d'Hebron Research Institute, Barcelona, Spain
[2]Public Health, Schulich School of Medicine and Dentistry, Western University, London, Canada
[3]International Health Unit, PROSICS, Vall d'Hebron Hospital, Barcelona, Spain
Contact: n.serre@vhebron.net

Background:
The aim of gamification is to provide an experiential exercise that invokes emotions to deepen learning. MyHealth project is interested in developing tools that facilitate healthcare access to newly arrived immigrants in Europe. One important barrier is the low levels of intercultural competency among healthcare professionals and the pervasiveness of negative health-related stereotypes.

Methods:
We aim to demonstrate the educational value and social impact of the Refugee Escape Room©, to 1) raise awareness about the social and health challenges faced by vulnerable migrants and 2) provide an effective intercultural competence and self-efficacy training for hosting community. The game was created in 2017 by healthcare professionals and university students with personal migratory experience. It is divided in two parts. The first part addresses knowledge gaps about relevant aspects of Migration and Health. The second part is a fictional border control exercise with multiple bureaucratic challenges that participants, organized as ''families'', must overcome to succeed. A pre-post pilot was executed to test for tool effectiveness. The piloting phase involved carrying out multiple instances of the activity for separate target groups. A questionnaire was developed with items related to knowledge, self-efficacy and intercultural competence. The questionnaire was filled by participants at baseline and post intervention to assess for statistically significant changes in all outcomes.

Results:
while the piloting phase is still ongoing preliminary results show a high level of acceptability and engagement with the tool.

Conclusions:
Refugee Escape Room© is a newly created tool that posits as a promising awareness-raising, competency-building gamification tool that is easily adaptable to multiple settings and participants.

Key messages:
- Gamification provides an experiential exercise that invokes emotions to deepen learning.
- Refugee Escape Room© is a promising tool for raising awareness about challenges faced by vulnerable migrants.

4.B. Cross cultural competence and access to health services for migrants

Transnationalism and Caring for Migrant Families with Young Children

Lisa Merry

L Merry[1], V Sicard[2], N Hibbert[3]
[1]Faculty of Nursing, University of Montreal, Montreal, Canada
[2]School of Kinesiology and Human Kinetics, University of Montreal, Montreal, Canada
[3]School of Public Health, University of Montreal, Montreal, Canada
Contact: lisa.merry@umontreal.ca

Background:
Migrant families' transnational ties may contribute to their hardships and/or may be a source of resiliency. A care approach that acknowledges these transnational ties may foster a positive identity and give coherence to experiences. We

conducted an integrative review to determine if there is evidence that health and social services supporting migrant families with young children consider transnational ties during care with these families.

Methods:

We searched 15 databases to identify relevant literature including empirical research and discussion papers reporting on a health or social program, service, intervention or care experience of migrant families during early childhood (pregnancy to age five) in a Western country (i.e., Canada, US, Europe or Australia). Information regarding if and how the intervention/service/program/care addressed transnationalism, were extracted and synthesized.

Results:

Over 34,000 records were screened; 296 articles met inclusion criteria. Most literature was from the US. Care, programs and interventions examined included prenatal classes, doula support, maternity care, postpartum home visits, breastfeeding support, nutrition and feeding counseling, and parenting and early childcare programs. There is evidence that care-providers empathize and offer information on family reunification processes for families dealing with separation from loved ones and are open to and accommodate cultural traditions (e.g., feeding and parenting practices) originating from the home country; otherwise there is little evidence that transnational ties are addressed during care.

Conclusions:

Significant knowledge gaps remain regarding whether and how care-providers' take into account transnational ties, including distance care-giving of children or elderly, use of health services abroad, and receipt of advice and support from family back home, which may affect their relationships with families and/or the effectiveness of their interventions.

Key messages:

- Significant knowledge gaps remain regarding whether and how care-providers' take into account transnational ties in early chilldhood care.
- More research is needed on transnationalism and the health and social care of migrant families.

Utilization, satisfaction and barriers of medical care among adults of Turkish descent in Germany

Christina Dornquast

C Dornquast[1], S Solak[1], M Durak[1], L Krist[1], KH Jöckel[2], S Schramm[2], B Schmidt[2], T Keil[1,3,4], T Reinhold[1]

[1]Charité - Universitätsmedizin Berlin, Institute for Social Medicine, Epidemiology and Health Economics, Berlin, Germany

[2]University Hospital Essen, Institute for Medical Informatics, Biometry and Epidemiology, Essen, Germany

[3]University of Würzburg, Institute for Clinical Epidemiology and Biometry, Würzburg, Germany

[4]Bavarian Health and Food Safety Authority, Institute for Health Resort Medicine and Health Promotion, Bad Kissingen, Germany

Contact: christina.dornquast@charite.de

Background:

The growing proportion of people with a migration background poses major challenges for public health and the health care system in Germany. People of Turkish descent represent the largest group within this specific population. The aim of this study was therefore to examine the use and satisfaction of medical services and barriers to health care access among adults of Turkish descent in Germany.

Methods:

A cohort study of a group of nearly 1200 Turkish adults in Berlin and Essen constitutes the basis of this analysis. The baseline examination was carried out as part of the pretests of the German National Cohort study. This follow-up survey assessed utilization, satisfaction and subjectively perceived barriers in the German health care system, as well as sociodemography, lifestyle, health status and quality of life via self-report (paper based or online) in Turkish or German. Descriptive preliminary results are presented in this abstract.

Results:

The first 287 participants interviewed until December 31, 2018 were on average 49 years old, with 64% being female. 90% of the participants had a family doctor and in the last 12 months, 17% were in a hospital for in-patient treatment and 23% in an emergency room. The use of screening programs varied from 15% (skin cancer screening) to 87% (mammography). The most frequently visited physician was the general practitioner (86%). The participants were satisfied regarding many aspects, with the best values for the communication with their doctor. However, 22% reported problems or barriers in the context of medical care in the last five years.

Conclusions:

These preliminary results provide a first insight into the utilization behaviour among adults of Turkish descent, their satisfaction as well as barriers with the German health care system. However, possible consequences of our study should only be discussed after all analyses have been completed.

Key messages:

- This is one of the few cohort studies in a migrant population in Germany.
- Knowledge of barriers could provide indications of problems of adults of Turkish descent in the German health care system.

The health situation of children and adolescents with migration background in Germany

Claudia Santos-Hövener

C Santos-Hövener[1], B Kuntz[1], L Frank[1], C Koschollek[1], U Ellert[1], H Hölling[1], R Thamm[1], A Schienkiewitz[1], T Lampert[1]

[1]Department of Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany

Contact: Santos-HoevenerC@rki.de

Introduction:

Although more than one third of minors living in Germany have a migration background (MB), valid data on the health of this population are still lacking. The German Health Interview and Examination Survey for Children and Adolescents in Germany (KiGGS wave 2, 2014-2017) provides population-based data to make reliable statements on the health of adolescents with and without MB.

Methods:

Survey data from KiGGS wave 2 are used to describe the general health status, mental health and the prevalence of allergic diseases in 3-to 17-year-old children and adolescents (n = 13,568). To determine overweight, body height and weight are measured (n = 3,463). In addition to MB (without/one-sided/two-sided), the socio-economic status (SES) and the length of stay of the parents in Germany are taken into account.

Results:

Children and adolescents with two-sided MB show a physician-diagnosed atopic dermatitis (3.5%vs.6.9%) and attention deficit hyperactivity disorder (ADHD) (1.5%vs.5.1%) less frequently than their peers without MB, but more often a moderate or poor general health status (6.1%vs.3.9%). Adolescents with two-sided MB are also more often affected by overweight than those without MB (22.1%vs.12.2%). If only participants with MB are considered, their health situation is often associated with the SES and partly also with the length of stay of the parents.

Discussion:

Health differences between children and adolescents with and without MB vary by the observed indicator. The heterogeneity of children and adolescents with MB, which can be partly determined by the SES or the length of stay of the parents, should be considered in target-group-specific interventions.

Main messages:

The vast majority of children and adolescents in Germany grow up healthy and a MB is not per se associated with a poorer health status. Our results suggest that considering MB as the sole determinant of health to reflect the impact of migration on health is insufficient.

Key messages:

- Migration background is not per se associated with a poorer health status.
- Socioeconomic status and parents' length of stay are derminants associated with poorer health outcomes among children and adolescents with migration background.

Health of adolescents with migration background in Germany: cross-sectional results from KiGGS wave 2

Carmen Koschollek

C Koschollek[1], S Bartig[1], A Rommel[1], T Lampert[1], C Santos-Hövener[1]
[1]Department for Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
Contact: KoschollekC@rki.de

Background:

Although 36.5% of minors in Germany had a migration background (MB) in 2017, data on their health situation is scarce. The project 'Improving Health Monitoring in Migrant Populations' (IMIRA) initiated in 2016 aims to expand health reporting on the health situation of people with MB, for which a core indicator set was developed. We are describing the health situation of adolescents based on selected core indicators.

Methods:

Data from the German Health Interview and Examination Survey for Children and Adolescents (KiGGS wave 2) (2014-2017) are used; adolescents from 11 to 17 years are considered. Prevalences and 95% confidence intervals are calculated for the following indicators: General health status, overweight, hazardous alcohol consumption and use of pediatric or general practitioner's services. These indicators are stratified along socio-demographic (gender, age, socio-economic status (SES)) and migration-related characteristics (MB, parents' duration of stay, language spoken at home).

Results:

There are hardly any migration-related differences in the general health status and the use of general medical services. While adolescents with MB are more often affected by overweight (without MB: 11.2%, one-sided: 18.9%, both-sided: 19.8%), they show less often risky alcohol consumption (without MB: 14.5%, one-sided: 7.8%, both-sided: 4.4%). There are differences in health behavior according to SES, parents' duration of stay in Germany and language spoken at home.

Conclusions:

Overall, the health of adolescents is good, regardless of their MB, and general medical services are used equally. Differences in health behavior cannot be reduced solely to the (non-)existence of a MB, but need a deeper consideration of more specific migration-related characteristics and the SES.

Key messages:

- The general health status and health care utilization do not differ between adolescents with and without MB.
- In contrast, the results on indicators of health behavior vary.

Transnational medication management by elderly migrants – a mixed-methods approach

Hürrem Tezcan-Güntekin

H Tezcan-Güntekin[1], N Akbulut[2], A Stern[2], I Özer-Erdogdu[1], O Razum[2]
[1]Alice Salomon University of Applied Science, Berlin, Germany
[2]School of Public Health, Bielefeld University, Bielefeld, Germany
Contact: tezcan@ash-berlin.eu

Background:

Many elderly people of Turkish origin choose a transnational lifestyle and commute between Germany and Turkey every few months. These circular migrants often suffer from chronic diseases. The transnational lifestyle can lead to discontinuities in long-term medication and irregular check-ups. If continuity of care is not ensured transnationally, health risks arise.

Methods:

In a mixed-methods study 8 expert-interviews with general practitioners and 25 guideline interviews were conducted with circular migrants to analyze their medication adherence. Additional quantitative analyses were conducted based on data from a German statutory health insurance popular with migrants to investigate discontinuities of prescribed medication.

Results:

Cross-border care involves different health risks with regard to medication adherence. For example, patients in Germany rarely receive the amount of medication they need for their stay in Turkey and there are discontinuities in medication delivery. The multi-perspective insight into the patients' experiences of medical care and the view of general practitioners shows strong variations of preferred strategies to handle the challenges of transnational medication management. Single strategies, such as leaving the health insurance card in one state for prescription and sending of medication through family members or asking for higher amounts of medication to store before travel, lead to frustration both at GPs' and patients' sides. GPs experience high pressure by the health system's structure in providing good care for the patients, especially in providing enough time for information transfer between GPs and patients.

Conclusions:

Transnational solutions for health care, and in particular medication care, such as an interprofessional collaborative care across borders or transnational e-health records need to be developed.

Key messages:

- A transnational lifestyle can lead to discontinuities in the provision of medication.
- Transnational, inter-professional cooperation is needed to ensure continuity of health care for circular migrants.

Development of a dictionary for transcultural care in Europe: a deliverable of the TNP project

Giagkos Lavranos

G Lavranos[1], M Prodromou[1], A Erken[2]
[1]European University Cyprus, Aglantzia, Cyprus
[2]Ahmet Sadnan MTAL, Izmir, Turkey
Contact: G.Lavranos@external.euc.ac.cy

Background:

Transcultural care remains a hot domain in current nursing practice, especially due to the challenges relating to increased population mobility due to both medical tourism and financial / political instability. The TNP (transcultural nursing for practice) Erasmus plus project was implemented between 2017-2019 to attempt to detect best practices regarding intercultural care in Europe as well as to develop suitable training materials to improve the communication among people of diverse ethnic, cultural and religious background.

Methods:

A study was conducted in January 2019 in all six countries participating in the TNP project. 6 healthcare professionals per country we invited to identify key terms relevant to 15 distinct domains of healthcare and health-related cultural and educational topics. After initial open term brainstorming, the terms were graded by all participants according to their perceived relevance to the project aim using a 3 round Delphi approach.

Results:

A total of 36 expert responders from all six countries agreed to participate of which 70% women. Age varied significantly between 35-75 years. After the final Delphi round, consensus was achieved, with a total of about 1100 words included in the final joined statement. The highest degrees of consensus was achieved for terms relating to parts of the body, common symptoms and conditions and healthcare-associated structures and professionals. On the other hand, a significantly lower degree of consent was determined regarding terms relevant to regional health topics, spiritual care, emotional / mental health and role of family and environment.

Conclusions:
Transcultural care is a necessary component of everyday practice in modern healthcare provision institutions. Despite significant language and cultural barriers, the main priority domains are almost universally uniform, thus justifying the development of suitable health promotion / education materials to minimize the relevant gap.

Key messages:
- Transcultural care is a current challenge in health promotion.
- Despite cultural differences, major terms of healthcare provision remain largely uniform across Europe.

A mixed-method evaluation study of a comprehensive cross-cultural training program in Stockholm

Jordanos Tewelde

J Tewelde[1,3], *M Dahlin*[2], *S Bäärnhielm*[1,2]
[1]Transcultural Centre, Stockholm County Council, Stockholm, Sweden
[2]Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
[3]Department of Public Health Sciences, Karolinska Institutet, Stockholm, Sweden
Contact: jordanos.2.tewelde@sll.se

Background:
Global migration and increasingly diverse populations poses new challenges to mental health services. Cultural differences between refugees and mental health professionals and lack of cultural competency is described as challenging. Cross-cultural training has been proposed as one way to reduce these problems. There are few evaluations on cross-cultural mental health training outcomes. Between 2016-2018, 13 one-day cross-cultural training interventions was implemented in Stockholm to equip mental health professionals to respond to mental health needs in a time of high influx of refugees.

Objectives:
To evaluate a comprehensive cross-cultural training program regarding participant's knowledge development, their experiences and views of the training - and their perceptions about their capacity to deliver mental care to refugee patients. An embedded mixed-method design was applied. We used before and after training questionnaires (n = 248) and conducted six focus group discussions (FGD) with mental health professionals. Quantitative data were analyzed by paired t-test and factor analysis, qualitative data were analyzed by thematic content analysis.

Preliminary results:
Before the training, significant differences of mean knowledge was found (p = 0.004) among participants. Principle axis Factoring resulted in 3 factors before and 4 factors after the training, explaining 78% of the covariance. Findings from the after training FGDs, revealed that refugee patients were described as different and challenging, and little was known about the reality they live in. The training contributed to a better understanding of migration, integration and refugee health- as well as the role of culture. Further, it promoted empathy and professional self-reflections.

Conclusions:
Cross-cultural training can contribute to knowledge development, attitude changes and also be valuable for care provider's professional role.

Key messages:
- Training mental health professional in cross-cultural issues may facilitate improved quality of care to refugee groups.
- The training can also strengthen participants in their professional role.

4.C. Round table: AI and Big Data: Ethical Challenges and Health Opportunities

Organised by: Digital Public Health Conference
Chair persons: Patty Kostkova - UK
Contact: caroline.wood@ucl.ac.uk

The recent emergence of Big Data in healthcare (including large linked data from electronic patient records (EPR) as well as streams of real-time geolocated health data collected by personal wearable devices, etc.) and the open data movement enabling sharing datasets are creating new challenges around ownership of personal data whilst at the same time opening new research opportunities and drives for commercial exploitation. A balance must be struck between an individual's desire for privacy and their desire for good evidence to drive healthcare, which may sometimes be in conflict. With the increasing use of mobile and wearable devices, new opportunities have been created for personalized health (tailored care to the needs of an individual), crowdsourcing, participatory surveillance, and movement of individuals pledging to become "data donors" and the "quantified self" initiative (where citizens share data through mobile device-connected technologies). These initiatives created large volumes of data with considerable potential for research through open data initiatives. In this workshop we will hear from a panel of international speakers working across the digital health, Big Data ethics, computer science, public health divide on how they have addressed the challenges presented by increased use of Big Data and AI systems in healthcare with insights drawn from their own experience to illustrate the new opportunities that development of these movements has opened up.

Key messages:
- The potential of open access to healthcare data, sharing Big Data sets and rapid development of AI technology, is enormous - so as are the challenges and barriers to achieve this goal.
- Policymakers, scientific and business communities should work together to find novel approaches for underlying challenges of a political and legal nature associated with use of big data for health.

Ethical challenges associated with health-related big data research

Marcello Ienca

M Ienca[1]
[1]Health, Ethics and Policy Lab, ETH Zurich, Zurich, Switzerland
Contact: marcello.ienca@hest.ethz.ch

Big data trends in biomedical and public health research hold promise for improving prevention, enabling earlier diagnosis, optimizing resource allocation, and delivering more tailored treatments to patients with specific disease trajectories. At the same time, due to their methodological novelty, algorithmic complexity and reliance on data mining for knowledge generation, big data approaches raise ethical challenges. This talk presents an overview of the major ethical challenges associated with health-related big data research. These include demarcating the boundary between personal health data and non-health data, re-defining the notion of private information, sustaining trust in health data sharing, preventing data-driven discrimination and ensuring a fair distribution of benefits and burdens among all stakeholders. Case studies from dementia research and public mental health will be discussed to illustrate these challenges and provide an ethical assessment. Furthermore, this talk will provide an overview of the normative proposals that have been recently advanced to align health-related big data research with established regulatory frameworks such as data protection regulation, regulation on human subject research and ethics review. Based on this analysis, suggestions will be made on how to maximise the benefits of big data for public health while minimizing ethical risks.

Cloud-computing and precision medicine: Big data offers big opportunities

Alain April

A April[1]
[1]Department of Software and IT Engineering, ETS University, Montreal, Canada
Contact: alain.april@etsmtl.ca

Research on large shared medical datasets and data-driven research are gaining fast momentum and provide major opportunities for improving health systems as well as individual care. Such Open Data can shed light on the causes of disease and effects of treatment including adverse reactions side-effects of treatments, while also facilitating analyses tailored to an individual's characteristics, known as personalized or precision medicine. Precision medicine treatments will take personalization to the next level and be effective for individual patients based on their genomic, environmental, and lifestyle factors. High-throughput sequencing technologies and open databases have made precision medicine possible but up to now only large research centres could handle the large scale technology needed for its processing. Aside from issues such as user trust, data privacy, transparency over the control of data ownership, and the implications of data analytics for personal privacy with potentially intrusive inferences, recent advances by Berkeley using open source Big Data technologies and Cloud Computing Services has allowed precision medicine studies to be conducted by small and agile research labs and researchers around the world.

The importance of ensuring artificial intelligence and machine learning can be understood at the human level

Sudha Ram

S Ram[1]
[1]College of Management, University of Arizona, Tucson, USA
Contact: sram@email.arizona.edu

With rapid developments in big data technology and the prevalence of large-scale datasets from diverse sources, the healthcare predictive analytics (HPA) field is witnessing a dramatic surge in interest. In healthcare, it is not only important to provide accurate predictions, but also critical to provide reliable explanations to the underlying black-box models making the predictions. Such explanations can play a crucial role in not only supporting clinical decision-making but also facilitating user engagement and patient safety. If users and decision makers do not have faith in the HPA model, it is highly likely that they will reject its use. Furthermore, it is extremely risky to blindly accept and apply the results derived from black-box models, which might lead to undesirable consequences or life-threatening outcomes in domains with high stakes such as healthcare. As machine learning and artificial intelligence systems are becoming more capable and ubiquitous, explainable artificial intelligence and machine learning interpretability are garnering significant attention among practitioners and researchers. The introduction of policies such as the General Data Protection Regulation (GDPR), has amplified the need for ensuring human interpretability of prediction models. In this talk I will discuss methods and applications for developing local as well as global explanations from machine learning and the value they can provide for healthcare prediction.

4.D. Workshop: MigHealthCare - strengthening Community Based Care to minimize health inequalities

Organised by: Mig-HealthCare consortium
Chair persons: Pania Karnaki - Greece, Allan Krasnik - EUPHA (MIG)
Contact: alejandro.gil.salmeron@uv.es

Over the past few years, a large number of refugees, migrants and asylum seekers have reached the south-eastern points of entry of the EU, challenging health and social systems of bordering countries with a spillover effect to the rest of the EU. Refugees, asylum seekers and migrants are at higher risk of poverty and social exclusion compared to the local populations, while the different vulnerable groups face diverse barriers when accessing health services. In many cases they do not receive appropriate health and social care that best meets their needs. Furthermore, in the EU MS, different practices apply to health and social care delivery for migrants/refugees. Research has shown the importance of community-based models to improve health care access of vulnerable migrants and refugees. Such models include elements of good communication, cultural awareness, sensitivity and respect for the diverse cultural and ethnic backgrounds by community health care staff as well health education and primary healthcare services.

Mig-HealthCare - strengthening Community Based Care to minimize health inequalities and improve the integration of vulnerable migrants and refugees into local communities, is a 3-year project, launched in 2017, with the financial support of the European Commission. It is implemented by a consortium of 14 partners among them universities, national authorities and NGOs from ten countries across Europe (Greece, France, Malta, Germany, Austria, Italy, Cyprus, Spain, Sweden and Bulgaria). The overall objective of Mig-HealthCare is to improve health care access for vulnerable migrants and refugees, support their inclusion and participation in European communities and reduce health inequalities. The project's specific objectives are:

- Describe the current physical and mental health profile of vulnerable migrants and refugees including needs, expectations and capacities of service providers.
- Develop a roadmap and toolbox for the implementation of community based care models, following an assessment of existing health services and best practices.
- Train community service providers on appropriate delivery of health care models for vulnerable migrants and refugees.
- Pilot test and evaluate community based care models which emphasize prevention, physical and mental health promotion and integration.

The project results are presented on behalf of the Mig-HealthCare consortium.

Key messages:

- The overall objective of Mig-HealthCare is to improve health care access for vulnerable migrants and refugees.
- The Mig-HealthCare project focuses on developing a roadmap to facilitate the effective implementation of community care models.

Survey on the physical and mental health among migrants and refugees in ten European countries

Pania Karnaki

P Karnaki[1], *D Zota*[1], *E Riza*[2], *A Gil-Salmerón*[3], *E Durá-Ferrandis*[3], *T Tsiampalis*[1], *A Linos*[1]
[1]Prolepsis Institute, Athens, Greece
[2]National and Kapodistrian University of Athens, Athens, Greece
[3]Polibienestar Research Institute, University of Valencia, Valencia, Spain
Contact: p.karnaki@prolepsis.gr

This study discusses the main findings of the quantitative research conducted within the Mig-HealthCare consortium countries to explore the physical and mental health of migrants and refugees. The study population is defined as migrants/refugees who have been residing in Europe, for at least 6 months and up to 5 years. In order to be able to capture the recent migration flow, the analysis was based on 1169 questionnaires collected in 10 EU-Member States, answered by adult migrants residing less than 5 years in the specific country.

A total of 29% of migrants stated that their health is poor or fair. Overall, 56.9% of migrants needed health care services during the last 6 months, however approximately one in four did not have access to them. The most frequent problems were long waiting times, not being able to organize an appointment, not knowing where to go, lack of communication and long distances. The most frequent chronic health problem migrants/refugees face is caries and headaches/migraines, followed by psychological disease and sleep disorders. Approximately one in three women have been pregnant since entering the current EU country, whereas one in four have had a miscarriage or abortion and 21.5% are currently pregnant.

Summing up, most of the migrants face common medical problems such as bad teeth, headaches and psychological problems. However long waiting times, not knowing where to go and lack of communication are barriers to accessing healthcare. The fact that the immunization status of migrants/refugees is unclear, a significant number suffer from serious chronic diseases and the limited breast and cervical cancer screening of female migrants/refugees pose serious threats to their health and important challenges for the health services of Europe.

Analysis of needs, expectations and capacities of health and social care professionals in order to provide culturally adapted care

Adele Lebano

A Lebano[1], *S Hamed*[1], *H Bradby*[1], *A Gil-Salmerón*[2], *J Garcés-Ferrer*[2], *P Karnaki*[3], *D Zota*[3], *E Riza*[4], *T Tsiampalis*[3], *A Linos*[3]
[1]Uppsala University, Uppsala, Sweden
[2]Polibienestar Research Institute, University of Valencia, Valencia, Spain
[3]Prolepsis Institute, Athens, Greece
[4]National and Kapodistrian University of Athens, Athens, Greece
Contact: adele.lebano@gmail.com

The Mig-HealthCare consortium conducted a qualitative study of the health care needs of vulnerable migrants/refugees in Europe. The research was conducted between Fall 2017 and Spring 2018. In total, 20 focus group discussions or, where necessary individual interviews (19), were organised with health care professionals and service providers; policymakers; and representatives from Non-Governmental Organisations - NGOs. Thematic qualitative analysis was employed. The main results of the analysis show that:

Health care provision for migrants is uneven throughout the EU and variations exist even within the same country. Health care providers and NGOs agree that health care for migrants is inadequate and biased in favour of particular conditions and cases (minors, pregnant women and acute conditions). Challenges faced by different countries vary; while in some countries the main issue is legal access, in other basic needs such as sanitation and basic infrastructure were emphasised. Austerity measures following the 2008 financial crisis have negatively affected the health care system in general, which in turn has negatively affected the provision of health care for migrants/refugees. Discrimination linked to socio-economic and ethnic conditions is reported as a barrier to equal health care access. Knowledge, language and communication on both the demand and the supply side of health care provision emerge as crucial to ensure equal access for migrants/refugees. Gender may act as a barrier with women tending to be more marginalised in the host country, in terms of language proficiency and health literacy, lowering health care access. One of the main challenges for providing equal health care access for migrants has to do with the ability to balance a universal right to health with the particular means of achieving it. The evidence collected here shows how this tension between end and means is at work in different moments of the provision of health care for migrants/refugees.

Best practices addressing healthcare care access of migrants and refugees in European countries

Eleni Riza

E Riza[1], *S Kalkman*[2], *P Karnaki*[3], *D Zota*[3], *A Gil-Salmerón*[4], *E Durá-Ferrandis*[4], *J Garcés-Ferrer*[4], *A Linos*[3]

[2]Department of Medical Humanities, University Medical Center Utrecht, Utrecht, Netherlands
[3]Prolepsis Institute, Athens, Greece
[4]Polibienestar Research Institute, University of Valencia, Valencia, Spain
Contact: eriza@med.uoa.gr

Mig-healthCare has identified sources in the countries and languages of the consortium providing guidance for community-based healthcare for migrants and refugees. A total of 54 sources that refer to best practices in seven European countries were identified. Results were categorized along with the themes: organization, communication, training, education and facilities & services. Successful organizational measures were a close collaboration with different governmental authorities, NGOs, community organizations and various local service providers. Moreover, engagement with members from both the host community and the migrant/refugee community in the design and implementation phases is essential. The need to track all activities through data collection and periodic evaluations is important in order to evaluate the effectiveness of systems. Funding was mentioned as important to secure continuity of projects and systems. Bridging communication barriers is a major facilitator to reduce health disparities. Differences in the types of practices and challenges per country were noted. Translators and cultural mediators are a key element in successful implementation, but across EU there is a need for more specialized staff to face the cultural barriers of the large variation in refugee/migrant backgrounds. The empowerment of migrants/refugees in promoting well-being through the engagement of the host community to help reduce stigma and discrimination is a successful strategy facilitating the access to care due to the increase of their health literacy skills. Finally, tailored services to give an answer to the specific needs of migrants and refugees are important, for example at first reception centres, standard medical screening and psychosocial risk assessment was recommended. Through this analysis, we can distinguish community-based care models elements facilitating the access of migrants and refugees to healthcare.

Modelling healthcare access for migrants and refugees in Europe: identifying the major health issues

Alejandro Gil-Salmerón

A Gil-Salmerón[1], *E Riza*[2], *P Karnaki*[3], *D Zota*[3], *A Linos*[3]
[1]Polibienestar Research Institute, University of Valencia, Valencia, Spain
[2]National and Kapodistrian University of Athens, Athens, Greece
[3]Prolepsis Institute, Athens, Greece
Contact: alejandro.gil.salmeron@uv.es

The Mig-HealthCare systematically searched to identify the key health areas of refugee/migrant health in order to facilitate interventions that help access to care services for migrants and refugees. The literature review was carried out in March 2018 using 3 large scientific databases using a combination of search terms following the PRISMA methodology and a standard set of items used to report on systematic reviews. Based on the predefined inclusion and exclusion criteria, a total of 118 publications were used for data extraction. It is important to note, that in almost all of the sources identified, the following cross-cutting factors were described as influencing access to healthcare:

- Continuity of Information, how it relates to policy, how it differs between health services and across-borders. Furthermore, the organizational coordination among social and health care providers in the host country determinates the successful access to healthcare of migrants/refugees.
- Language & Communication takes into consideration both the healthcare service and its provision of translators and cultural mediators, and the host country language proficiency of the migrant/refugee.
- Organizational improvement of access and delivery of health care services for migrants and refugees in addition to Cultural Competence of the healthcare providers meaning the ability to maximize their sensitivity in the service of care to culturally diverse groups.
- Health literacy understood as the motivation and competences of the migrant population to access, understand, appraise, and apply health information.

Additionally, the health issues of particular importance for migrants/refugees as emerged from the systematic review, including mental health, maternal/child health, health promotion, NCDs and chronic diseases, Oral/lDental health, and Vaccinations should be included in planning future needs and healthcare access.

Predictions concerning the use of health care services in Europe by migrants/refugees and the Mig-HealthCare Roadmap & Toolbox

Konstantina Zota

D Zota[1], *P Karnaki*[1], *A Gil-Salmerón*[2], *J Garcés-Ferrer*[2], *E Riza*[3], *A Linos*[1]
[1]Prolepsis Institute, Athens, Greece
[2]Polibienestar Research Institute, University of Valencia, Valencia, Spain
[3]National and Kapodistrian University of Athens, Athens, Greece
Contact: d.zota@prolepsis.gr

Based on the multiple levels of research conducted within the project the consortium developed a roadmap & toolbox which includes the following categories: Continuity of information, Language Culture & Communication, Mental Health, Vaccinations, Maternal/child health, Health promotion, Oral health/Dental Care and NCDs while the Toolbox contains tools on these categories in different languages. The roadmap & toolbox is accessible through the project website. In addition, different scenarios, giving a comprehensive picture of the foreseen situation and the evidence-based policies and actions needed to maximize the effective delivery and sensitivity in the service of care to culturally diverse population groups were developed focusing on mental health, chronic disease management and oral health. Refugees and migrants tend to have a higher prevalence of mental distress compared to non-refugees. For the challenge of lack of recording mental health of migrants/refugees, improving the collaboration between 'migrant-specific' organizations is needed. Health care systems in Europe will have to accommodate the high demand for health care services for chronic conditions among migrants/refugees in the coming years. Implications such as the impact of poverty, level of health literacy and/or the cultural adaption of the measures need to be considered when planning to address future trends related to non-communicable diseases including diabetes among migrants/refugees. The provision of oral care presents great variability across the European countries, but in most cases, it is characterized by high cost and restricted range of services if offered within the state health systems. Migrants /refugees will not be able to meet the high cost of private dental care. Local community interventions have been proven very effective.

4.E. Public health: politics and policies

The European Semester 2015-2018: themes and progress of country specific recommendations on health

Timo Clemens

T Clemens[1], *N Azzopardi-Muscat*[1,2]
[1]CAPHRI Care and Public Health Research Institute, Maastricht University, Maastricht, Netherlands
[2]Department of Health Services Management, University of Malta, Msida, Malta
Contact: timo.clemens@maastrichtuniversity.nl

Background:

The European Semester (ES) is a policy coordination and scrutiny framework at EU-level for surveillance of fiscal and macro-economic policies in Member States. Health systems have not evaded that scrutiny. The analysis focusses on how health systems reforms are being endorsed in Country Specific Recommendations (CSRs) and how the ES process links to planning and implementation of national health system reforms over the period 2015-2018.

Methods:

A descriptive content analysis of CSRs with a search for the keywords and phrases 'health', OR 'healthcare', OR 'long-term care' was performed for the years 2015-2018. Furthermore, CSRs addressing health systems were classified according to whether they were targeting access, quality or sustainability; and categorized regarding organisation and governance, financing, physical and human resources, and provision of services. Finally, implementation progress on the health CSRs was rated according to EC's own evaluation scheme derived from the preceding year's country report.

Results:

CSRs with health system recommendations have featured continuously in the ES process each year and have stabilised in number. The themes of health CSRs are still dominated by financial sustainability, cost-effectiveness and of financing, although other health system goals and domains, particularly access, are increasingly addressed. There is a high degree of consistency on the content of health CSRs over the years for each country addressed. Progress with implementation of health CSRs is disappointing so far, based on the EC evaluations. No clear link between discontinuation of health CSRs and evidence of progress in implementing the CSR can be discerned.

Conclusions:

The results uncovered some of the links between national and European institutions leveraging the ES to push health system reforms. However, a more balanced and long-term view is needed for the ES to contribute solidly to complementing national efforts in a complex reform context.

Key messages:

- Health CSRs are still dominated by financial sustainability considerations while other health system goals and domains are increasingly addressed.
- Progress with implementation of health CSRs is disappointing so far, although a longer-term perspective is needed to pay tribute to the complex reform environment of health system reforms.

Deindustrialisation, Foreign Investment and Social Development: Mortality in the Hungarian Rustbelt

Gabor Scheiring

G Scheiring[1]
[1]Dondena Centre, Bocconi University, Milan, Italy
Contact: gabor.scheiring@unibocconi.it

Background:

Many nations are experiencing deindustrialisation. A common strategy to cope with this is encouraging foreign investment. We still know little about the health impact of such industrial transformations, especially their role in the postsocialist mortality crisis.

Methods:

Utilising a novel dataset constructed over two years covering 52 towns, 550 companies and 42,800 subjects, using multilevel survival modelling I test how deindustrialisation and foreign investment affect mortality in medium-sized towns in Hungary. I group towns into severely, and moderately deindustrialised (1989-1995), and into state ownership, domestic private and foreign ownership dominated categories (1995-2004). A retrospective cohort study in these towns collected data on vital status of respondents. I use multiple robustness checks and sensitivity analyses to reduce selection bias and endogeneity.

Findings:

Deindustrialisation is associated with significantly higher odds of mortality for men between 1989 and 1995 (OR = 1. 16; $p < 0.01$). Foreign investment was not associated with mortality in any of the models for the 1989-1995 period. Between 1995 and 2004, women living in towns dominated by state ownership had a significantly lower risk of mortality compared to those living in towns dominated by foreign investment (OR = 0.79; $p < 0.05$) or domestic private ownership (OR = 0.74; $p < 0.01$). Foreign investment was associated with higher income growth in both periods; however, this was not associated with better health results.

Conclusions:

Severe deindustrialisation was a crucial factor behind the post-socialist mortality crisis for men. The indirect economic benefits of foreign investment do not translate automatically into better health; in fact, women living in towns dominated by foreign investors appear to have a higher risk of dying. Foreign investment might promote economic growth but in itself cannot mitigate the health impact of severe deindustrialisation.

Key messages:

- Deindustrialisation is a significant contextual health risk factor.
- Spontaneous market processes, such as foreign investment, do not automatically reduce the detrimental health effect of plant closures.

Deaths of despair and Brexit votes: cross-local authority statistical analysis in England and Wales

Jonathan Koltai

J Koltai[1]*, FM Varchetta*[1]*, M Mckee*[2]*, D Stuckler*[1]
[1]Bocconi University, Milan, Italy
[2]LSHTM, London, UK
Contact: koltai@unibocconi.it

Objectives:

To test the hypothesis that 'deaths of despair', a marker of social suffering, was associated with greater support for Brexit in the UK's 2016 EU referendum.

Methods:

Cross local authority regression models of 2016 Brexit referendum vote shares for each local authority in England and Wales on changes in rates of suicide and drug-related deaths pre- (2005-2007) and post-recession (2014-2016), adjusting for several socioeconomic and demographic factors. Survey population: 345 local authorities in England and Wales.

Results:

Greater mortality rates from deaths of despair were significantly associated with higher Brexit vote shares. In unadjusted models, an increase of 10 drug-related deaths per 100 000 associated with a 13.20 percentage point increase in Brexit votes (95% CI: 7.09 to 19.31), while an increase of 10 suicides per 100 000 was associated with a 9.93 percentage point increase in vote shares for Brexit (95% confidence interval 6.21 to 13.65). These associations are explained by local area-level economic and education factors.

Conclusions:

Worsening external causes of death correlate with Brexit voting. Such deaths may serve as an early warning indicator for political instability.

Key messages:

- Prior research has shown correlations between deaths of despair and votes shares for Trump in the 2016 US presidential election.
- We extend this research to the UK, showing that greater mortality rates from deaths of despair were significantly associated with higher Brexit vote shares.

Right-wing populism and self-rated health in Europe: a multilevel analysis

Insa Backhaus

I Backhaus[1,2]*, S Kino*[2]*, G La Torre*[1]*, I Kawachi*[2]
[1]Department of Public Health and Infectious Diseases, Sapienza University, Rome, Italy
[2]Department of Social and Behavioral Sciences, Harvard T.H. Chan School of Public Health, Boston, USA
Contact: insa.backhaus@uniroma1.it

Background:

Individuals who hew to a conservative political ideology have been previously reported to have better self-rated health compared to liberals. No studies have examined whether the correlation between right-wing ideology and health also holds for populism, a brand of politics that is gaining momentum throughout the world. We tested whether the association still holds for right-wing populists.

Methods:

We analysed data from 24617 respondents nested within 18 European countries included in the 2016 European Social Survey. Multilevel analyses were conducted to assess the relationship between political ideology and self-rated health, adjusting for other individual covariates (happiness and social capital) and country-level characteristics (democracy type).

Results:

Individuals who voted for right-wing populist parties were 43% more likely to report fair/poor health compared to traditional conservatives (OR = 1.43, 95% confidence interval 1.23 to 1.67). The association was attenuated after controlling for individual-level variables, including happiness and access to social capital (OR = 1.21, confidence interval 1.03 to 1.42). Higher levels of social capital (informal networks, OR = 0.40, 95% confidence interval 0.29 to 0.56; trust, OR = 0.82, 95% confidence interval 0.74 to 0.92) and happiness (OR = 0.18, 95% confidence interval 0.15 to 0.22) were protectively correlated with fair/poor self-rated health.

Conclusions:

Individuals voting for right-wing populist parties report worse health compared to conservatives. It remains unclear whether ideology is just a marker for health-related practices, or whether the values and beliefs associated with a particular brand of ideology leads to worse health.

Key messages:

- There is a significant association between voting for right-wing populist parties and self-rated poor health.
- Social capital was protectively correlated with self-rated health calling for renewed attention on the effects of social capital on political ideology and health.

The equity impact of a universal child health promotion programme

Anni Maria Pulkki-Brännström

AM Pulkki-Brännström[1], *M Lindkvist*[1,2], *E Eurenius*[1], *J Häggström*[2], *A Ivarsson*[1], *F Sampaio*[3], *I Feldman*[3]
[1]Department of Epidemiology and Global Health, Umeå University, Umeå, Sweden
[2]Department of Statistics, USBE, Umeå University, Umeå, Sweden
[3]Department of Public Health and Caring Sciences, Uppsala University, Uppsala, Sweden
Contact: anni-maria.pulkki-brannstrom@umu.se

Background:

We aimed to evaluate whether the Salut Programme, a universal child health promotion intervention, aimed to strengthen healthy lifestyles in northern Sweden, had any effect on income-related inequalities in positive birth outcomes for children and on healthcare use for children and their mothers.

Methods:

Mother's residence and child's date of birth determined whether the child and the mother belonged to the control group (areas that received care-as-usual) or the intervention group (areas with the intervention implemented from 2005), during the pre-measure period (children born 2002-2004) and the post-measure period (children born 2006-2008). The sum of parents' taxable income was used for socioeconomic ranking. We computed the standard concentration index for six binary indicators of positive birth outcomes, and for inpatient and day patient care for children and mothers during the two years after delivery. Using a difference-in-difference approach, we assessed whether the extent of inequality changed over time between areas.

Results:

Income-related inequalities in child health status at birth and in child healthcare use were absent, except that full-term pregnancies were concentrated among the poor at pre-measure in the intervention group. However, mothers' healthcare use was significantly pro-poor in the control group. The extent of inequality changed between pre- and post-measure periods for two outcomes: the pro-poor concentration of full-term pregnancies in the intervention group at pre-measure disappeared at post-measure; and an increase in pro-poor concentration of normal birth weight in the control group was not matched by a similar increase in the intervention group. Inequalities in healthcare use did not change significantly.

Conclusions:

Birth outcomes and child healthcare use seemed to be equitably distributed. However, the results raise concerns whether the intervention may have reduced the pro-poor concentration of positive birth outcomes.

Key messages:

- There are concerns that participation in universal health promotion programmes differs by socioeconomic status, although few public health interventions have been evaluated from an equity perspective.
- Birth outcomes and child healthcare use in Northern Sweden seemed to be equitably distributed across different socioeconomic groups.

Prevalence of non-adequate health literacy in Europe: a systematic review and meta-analysis

Carolina Di Paolo

V Baccolini[1], *C Di Paolo*[1], *C Salerno*[1], *A Rosso*[1], *GP Prencipe*[1], *C Isonne*[1], *C Marzuillo*[1], *C De Vito*[1], *P Villari*[1], *F Romano*[1]
[1]Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy
Contact: carolina.dipaolo@uniroma1.it

Background:

Many studies show that a low level of health literacy (HL) is associated with several adverse outcomes. The aim of this systematic review was to estimate the prevalence of non-adequate HL (NAHL) in European countries and outline the main needs for interventions.

Methods:

The systematic search was performed in April 2019 and updated in June 2019. PubMed, Embase and Scopus were searched. Articles were considered eligible if they were cross-sectional studies published in English after 2000 and estimating the NAHL prevalence in European countries. Globally, 15490 articles were retrieved. Adapted Newcastle-Ottawa Scale was applied for the quality assessment. Several stratified meta-analyses were carried out. We also performed a meta-regression analysis to test the association between variables and NAHL.

Results:

In total, 59 articles of heterogeneous quality were included, providing data for 98 studies to include in the proportion meta-analysis. Overall, quantitative analysis yielded a pooled NAHL prevalence of 40% (95%CI, 36%-43%). Despite the prevalence varied considerably by country, it seemed to follow a geographic gradient, with the northern countries clearly having a lower prevalence than the other European counterparts. The pooled prevalence estimates (PEs) varied significantly according to the different type of HL assessment method applied. Also, high study quality was found to be significantly associated with a reduction of NAHL in the PEs. Grouping the sample in general population, oncology patients, chronic disease patients and refugees, the meta-regression analysis showed a significantly lower prevalence of NAHL in oncology patients.

Conclusions:

Although the PEs varied in relation to several factors (e.g. either among population groups, or depending on the HL assessment method), this study shows that more than one in every three surveyed participants had NAHL. Targeted strategies and coordinated policies aiming at improving HL in the Region are needed.

Key messages:

- Despite several variations, a significant proportion of European population has non-adequate health literacy.
- Targeted public health strategies of intervention are crucial to address this deficit.

4.F. Healthy start to life

Maternal immigrant status and signs of neurodevelopmental problems in early childhood

Heiko Schmengler

H Schmengler[1,2,3], *F El-Khoury Lesueur*[1], *A Yermachenko*[1], *M Taine*[4], *D Cohen*[5,6], *H Peyre*[7,8,9], *C Saint-Georges*[5,6], *X Thierry*[10], *M Melchior*[1]

[10]Institut National d'Études Démographiques, Paris, France
Contact: h.schmengler@uu.nl

Background:

A growing body of evidence suggests that children of immigrants may have increased risks of neurodevelopmental disorders. However, evidence based on parent report and on very young children is lacking. We therefore investigated the association between maternal immigrant status and early signs of neurodevelopmental problems in a population-based sample of two-year-old children using standardized parent-report instruments.

Methods:

We used data from the French representative ELFE birth cohort, initiated in 2011. The study sample included 9,900 children of non-immigrant French, 1,403 children of 2nd, and 1,171 children of 1st generation immigrant women followed-up to age two years. Neurodevelopment was assessed using the Modified Checklist for Autism in Toddlers (M-CHAT) and an adaptation of the MacArthur-Bates Communicative Development Inventories (MB-CDI).

Results:

In fully adjusted linear regression models, maternal immigrant status was positively associated with M-CHAT scores, with stronger associations in children of 1st (β-coefficient: 0.19; 95% CI 0.08-0.29) than 2nd generation immigrants (0.09; 0.01-0.17). This association was especially strong among children of 1st generation immigrant mothers native of North Africa (vs. non-immigrant French: 0.33; 0.16-0.49) or French-speaking Sub-Saharan Africa (0.26; 0.07-0.45). MB-CDI scores were lowest among children of 1st generation immigrant mothers, particularly from mostly non-francophone regions. Children of 1st generation immigrant mothers were most likely to have simultaneously low MB-CDI and high M-CHAT scores.

Conclusions:

Our findings suggest that maternal immigrant status is associated with higher risks of early signs of neurodevelopmental difficulties, with strong variations according to maternal region of origin. Standardized screening instruments may aid the early detection and treatment of these difficulties, helping to address inequalities in neurodevelopmental health in children of immigrants.

Key messages:

- Children of immigrant mothers in a population-based sample appear to have elevated neurodevelopmental risks, as assessed by maternal report. This is in line with evidence from clinical samples.
- We found strong variations according to maternal region of origin, with the highest risks in children of 1st generation immigrant mothers from North Africa and French-speaking Sub-Saharan Africa.

Association between legal status, prenatal care utilization, severe perinatal and maternal morbidity

Maxime Eslier

M Eslier[1], T Schmitz[4], D Luton[5], L Mandelbrot[6], C Estellat[2,3], E Azria[1,7]
[1]UMR1153, Obstetrical, Perinatal and Paediatric Epidemiology (EPOP_x0001_e research team), DHU Risks in Pregnancy, Paris Descartes University, Paris, France

[3]UMR 1123, CIC 1425-EC, Paris, France
[4]Department of Obstetrics and Gynaecology, Robert Debré Hospital, AP-HP, Paris Diderot University, Paris, France
[5]Department of Obstetrics and Gynaecology, Beaujon-Bichat Hospital, DHU Risks in Pregnancy, APHP, Paris Diderot University, Paris, France
[6]Department of Obstetrics and Gynaecology, Louis Mourier Hospital, DHU Risks in Pregnancy, AP-HP, Paris Diderot University, Colombes, France
[7]Maternity Unit, Paris Saint Joseph Hospital, DHU Risks in Pregnancy, Paris Descartes University, Paris, France
Contact: maxime.eslier@hotmail.fr

Background:

Some groups of migrant women have a higher risk of inadequate prenatal care utilization (PCU), severe maternal morbidity (SMM) and severe perinatal morbidity (SPM). To better understand this association, our aim was to assess the association between the legal status and PCU, SMM and SPM during pregnancy.

Methods:

The analysis was performed in the database of the multicenter prospective PreCARE cohort. All pregnant women registered for delivery in 4 university hospital maternity units in Paris north area from October 2010 to May 2012 were included (N = 10 419). Women whose pregnancies ended before 22 weeks of gestation or who delivered in another maternity unit were excluded (N = 820). Women were distributed according to legal status in 4 groups: non-migrants, migrants with French or European nationality, legal migrants and undocumented migrants. The associations between the legal status and the composite variables of prenatal care utilization, SMM and SPM were tested through multivariate logistic regressions also adjusted for maternal characteristics.

Results:

The illegal status was associated with increased risk of inadequate prenatal care utilization [adjusted odds ratio (aOR) 2,52 (2,10 - 3,01)]. Overall, the prevalence of SMM was 3,2 % and SPM 7,0 %. The illegal status was associated with higher risk of SMM [aOR 1,84 (1,21 - 2,79)], especially severe hypertensive disorder of pregnancy [aOR 2,29 (1,19 - 4,40)]. However, no significant association with SPM was found [aOR 1,29 (0,95 - 1,74)]. The sensitivity analysis demonstrates that results do not change after exclusion of women who arrived less than 12 months before delivery and those who started their follow-up after 14 weeks of gestation.

Conclusions:

The illegal status was associated with an inadequate prenatal care utilization and a higher risk of SMM, especially severe hypertensive disorder of pregnancy.

Key messages:

- The illegal status was associated with increased risk of inadequate prenatal care utilization.
- The illegal status was associated with higher risk of severe maternal morbidity during pregnancy.

Could increasing income in lone-parent households reduce inequality in child mental health problems?

Sungano Chigogora

S Chigogora[1], A Pearce[2], R Viner[1], S Morris[3], D Taylor-Robinson[4], S Hope[1]
[1]Population, Policy and Practice Programme, UCL, London, UK
[2]MRC/CSO Social and Public Health Sciences Unit, University of Glasgow, Glasgow, UK
[3]Department of Applied Health Research, UCL, London, UK
[4]Public Health and Policy, University of Liverpool, Liverpool, UK
Contact: s.chigogora.11@ucl.ac.uk

Half of lone-parent families in the UK live in relative poverty (income <60% national median) compared to a quarter of two-parent families. Family hardship is associated with increased risk of child mental health problems (CMHP). Using data from the UK Millennium Cohort Study (~18,000 children born 2000-02), we investigated whether equalising income between lone- and two-parent households could reduce prevalence and inequality in CMHP. Exposure was family structure (lone-/ two-parent household) at 9 months; mediator was equivalised weekly household income at 3 years(y); outcome was parent-report CMHP at 5y (Strengths and Difficulties Questionnaire; normal/ borderline-abnormal). The analytic sample comprised 11,193 children.

We modelled the relationship between family structure, income and CMHP in logistic marginal structural models, weighted for attrition to MCS at 5y, and adjusted for baseline and intermediate confounding. Prevalence of CMHP was assessed overall and according to family structure. Differences between lone and two-parent households were represented by risk ratios (RRs) and differences (RDs) [95% CIs]. We modelled a hypothetical increase in income for all lone-parent households, so that median income was equalised between lone- and two-parent households, and re-estimated prevalence, RRs and RDs.

Prevalence of CMHP was 8.5%. Children from lone-parent households were more likely to exhibit CMHP (RR 1.73[1.28-2.19]; RD 5.70[2.44-8.97]). Equalising income reduced prevalence (8.2%), and differences in CMHP by family structure (RR, 1.37[0.90-1.83]; RD, 2.86[-0.06-6.31]). Sensitivity analyses showed that associations between exposure, mediator and outcome were comparable in more recent MCS sweeps, indicating that these relationships still hold today. Inequalities in CMHP between lone- and two-parent families in the UK are large. Levelling up income for lone-parents households could reduce differences in child mental health problems related to family structure.

Key messages:

- Inequalities in CMHP between lone- and two-parent families in the UK are large.
- Levelling up income for lone-parents households could reduce differences in child mental health problems related to family structure.

A comparison of the effects of maternal anxiety and depression on child development

Shakked Gete

S Gete[1], *R Calderon-Margalit*[1], *I Grotto*[2], *A Ornoy*[3]
[1]Braun School of Public Health, Hebrew University-Hadassah, Jerusalem, Israel
[2]Public Health, Ministry of Health, Jerusalem, Israel
[3]School of Medicine-IMRIC-Medical Neurobiology, Hebrew University-Hadassah, Jerusalem, Israel
Contact: shakkedlub@gmail.com

Background:

Most studies on the association between the mental health of mothers and the development of their offspring have focused on maternal depression, but only a few have investigated the association between maternal anxiety and child development. We aimed to compare the associations between maternal depression and anxiety symptoms 6-8 weeks postpartum and infant development at 1 year.

Methods:

We conducted a longitudinal study of 396 mother-child dyads. The mothers were recruited after birth in 3 different hospitals in Israel in 2017 and were followed for one year. Mothers were assessed by completing the General Anxiety Disorder-7 (GAD-7) questionnaire and the Edinburgh Postnatal Depression Scale (EPDS) 6-8 weeks postpartum. Child development was assessed by the Ages & Stages Questionnaires (ASQ-3) at 12 months. Multivariate linear regressions were used to explore the relationship between the EPDS and GAD-7 scores and child development, all as continuous variables, adjusting for maternal education, parity, and gender.

Results:

Depressive symptoms postpartum were only associated with poor personal-social skills (β=-0.5, 95% CI: -0.91, -0.08). Increasing maternal anxiety was associated with poorer development in communication skills (β =-0.48, 95% CI: -0.93, -0.04), personal-social skills (β =-1.02, 95% CI: -1.58, -0.46), solving problems skills (β =-0.7, 95% CI: -1.27, -0.14) and fine motor skills (β =-0.46, 95% CI: -0.9, -0.02). Neither anxiety nor depressive symptoms were associated with gross motor skills. Controlling for quality of attachment, the associations of depression and anxiety with development were no longer significant, suggesting mediation.

Conclusions:

Postpartum anxiety was a stronger predictor of low developmental scores than depression, and associations were probably mediated by impaired attachment. Identifying and supporting mothers experiencing anxiety after birth may mitigate the risk of developmental delays in children.

Key messages:

- Maternal anxiety was found to be a significant risk factor for developmental delay at 1 year of age.
- The association between maternal anxiety and child development was probably mediated by attachment.

Degree of consistency of parental dietary and sedentary behavior rules as indicators for overweight

Emilie Ruiter

ELM Ruiter[1], *GAJ Fransen*[1], *M Kleinjan*[2], *GRM Molleman*[1], *K van der Velden*[1], *RCME Engels*[3]
[1]Academic Collaborative Center AMPHI, Radboudumc, Nijmegen, Netherlands
[2]Trimbos Institute, Utrecht, Netherlands
[3]Executive board, Erasmus University, Rotterdam, Netherlands
Contact: emilie.ruiter@radboudumc.nl

Background:

To increase our understanding of the effect of parenting on the child's likelihood of becoming overweight, we attempted to identify typologies based on how consistently parents apply dietary and sedentary behavior rules, and we examined whether these typologies are associated with energy balance-related behaviors in children and/or with the prevalence of overweight children.

Methods:

Data were obtained from a cross-sectional survey of the Community Health Service in Nijmegen, the Netherlands in which a total of 4,865 parents of children aged 4-12 years participated. Data were collected using validated self-report questionnaires. To identify typologies based on how consistently parents apply dietary and sedentary behavior rules, we performed latent class analyses. We then performed regression analyses to examine the correlation between these typologies and socio-demographic characteristics, dietary and sedentary behaviors, and overweight.

Results:

Latent class analyses revealed the existence of the following four distinct, stable classes/typologies; parents who have: (1) no dietary behavior rules, plus indulgent sedentary behavior rules; (2) indulgent dietary behavior rules, plus no sedentary behavior rules; (3) overall indulgent rules; (4) overall strict rules. Children of parents with overall strict rules (class 4) had significantly healthier dietary and sedentary behaviors compared to the children of parents in the other three classes. Children 8-12 years of age with parents in class 2 were the most likely to be overweight; compared to the children of parents in classes 1, 3, and 4, the parents in class 2 had the lowest level of education and the higher number of Turkish and Moroccan immigrants.

Conclusions:

These results underscore the need for parents to establish strict rules for their children, particularly regarding sedentary behaviour in order to minimize the child's likelihood of becoming overweight.

Key messages:

- The results underscore the need for parents to establish strict rules for their children, particularly regarding sedentary behaviour in order to minimize the child's likelihood of becoming overweight.
- These results may contribute to making healthcare professionals aware that children of parents who do not apply sedentary behavior rules are more likely to become overweight.

4.G. Chronic diseases: surveillance and management

Transitional care models for chronic patients: preliminary results from an umbrella review

Maria Teresa Riccardi

MT Riccardi[1], *M Cicconi*[1], *W Ricciardi*[1,2], *MM Gianino*[3], *G Damiani*[1,2]
[1]Institute of Public Health - Section of Hygiene, Università Cattolica del Sacro Cuore, Rome, Italy
[2]Fondazione Policlinico Universitario A.Gemelli IRCCS, Rome, Italy
[3]Department of Public Health Sciences and Pediatrics, Università di Torino, Turin, Italy
Contact: mt.riccardi@gmail.com

Worldwide, chronic diseases are burdening and the health systems need to be rethought to better manage this epidemiologic shift. One of the critical points in the care pathway of chronic patients is the transition from one care setting to another. Aim of this study is to provide an overview of the current evidence on the impact of transitional care programs on health and economic outcomes for chronic patients

Medline, Web of Science and EMBASE were queried for relevant reviews using the Population-Intervention-Context-Outcome (PICO) model. The quality of the included articles was determined using A MeaSurement Tool to Assess systematic Reviews (AMSTAR 2). Data were analyzed using descriptive statistic, and comparison among studies carried out in European Union (EU) versus non-EU was performed (Chi-square test was used and a $p < 0.05$ was deemed as statistically significant)

124 reviews were assessed for eligibility and 14 were eventually included (for a total of 167 primary articles). Quality appraisal was critically low in 60% of the reviews. Both hospital readmission rate and Emergency Department (ED) visit rate were lower than those in usual care group, but this difference was significant in 40% of articles. In EU studies readmission rate was lower in 65% of cases while in non-EU ones the percentage was 51.0%, but the difference was not significant ($p = 0.23$). Six reviews (43%) investigated the economic impact of the transitional care: most reported an initial increase in cost due to investment in staff training and creation of organizational networks, followed by a sharp decrease in costs due to a better utilization of health services, thus leading to a reduction in overall costs.

Compared with usual care, transitional care shows an overall cost reduction, even if with limited effects on re-hospitalization or ED visit rates. These findings should encourage decision makers to invest in the development of this kind of programs in order to identify models that best perform.

Key messages:

- The patient transfer supervision from one care setting to another is necessary for continuity of care, but there is no robust evidence about the better performance of transitional care models.
- Systematically reviewed transitional care models has been shown be more cost saving, with a moderate impact on hospital readmission or emergency department visits rates.

The use of quality indicators (QIs) to evaluate the oncologic care in CCCN: a systematic review

Rosario Andrea Cocchiara

RA Cocchiara[1], *A Mannocci*[1], *S Cianfanelli*[1], *C Sestili*[1], *V D'Egidio*[1], *L Lia*[1], *I Backhaus*[1], *B Dorelli*[1], *A Federici*[2], *G La Torre*[1]
[1]Department of Public Health and Infectious Diseases, Sapienza University, Rome, Italy
[2]Department of Public Health, Ministry of Health, Rome, Italy
Contact: rosario.cocchiara@uniroma1.it

Due to the increase of life expectancy for cancer patients, it has become necessary to implement complete and economically sustainable clinical care pathways that integrate different professional competences. The Comprehensive Cancer Care Network (CCCN) model consists of multiple specialized structures that cooperate for cancer patients care. Quality Indicators (QIs) represent valid and reliable tools of evaluation that allow a standardized comparison among different structures. The aim of this systematic review was to highlight a wide and complete description of the implemented QIs within the CCCNs and to identify and analyze methodologies used for the development of QIs. The literature was performed investigating two databases (PubMed and Scopus) and the search identified 7342 studies. After duplicate removal, title and abstract screening, and full text evaluation, 46 studies were included in the study. Most QIs were implemented in USA, Germany and Italy where the CCCN approach seems to be well defined. Eighty -two QIs concerned diagnosis, 260 concerned treatment, 7 concerned prevention, 29 about follow up, 71 about palliative care, 12 concerned rehabilitation and 7 research. The majority of the identified QIs belonged to the process domain, followed by the structure ones. Excluding QIs related to the management of cancer in general, the most represented organs resulted breast, colorectum and lung. Overall, it can be stated that the most represented categories of QIs concerned diagnosis and treatment. Furthermore, also the palliative care domain appeared very represented. Regarding the methodology of the QIs development, a consensus approach among experts and the Delphi method were the most frequently used methodologies. Only a few studies included the participation of patients for the implementation of the QIs. This systematic review provides a synthesis of existing QIs related to the setting of integrated oncological care

Key messages:

- The CCCN has been recognized as an ideal model for structuring the process of care that guarantees a complete and integrated approach for the management of oncological patients.
- Quality Indicators represent valid and reliable tools that should be used to perform a standardized comparison among different healthcare systems and to guarantee a homogeneous quality of care.

Clinicians' decision making about Parkinson's treatment plans using self-report vs digital data

Lada Timotijevic

L Timotijevic[1], *P Rusconi*[1], *C Hodgkins*[1], *BM Egan*[1], *A Banks*[1]
[1]Psychology, Food Consumer Behaviour and Health Research Centre, Surrey, UK
Contact: l.timotijevic@surrey.ac.uk

Background:

An mHealth-based support systems promise to deliver objective data about the patient's healthcare status to the clinician in a timely manner but at the same time, risks increasing 'technical uncertainty'', by increasing the amount of available information, but not necessarily its utility in making medical decisions.The study aim was to investigate clinicians' decision making about treatment and care plans based on the relative utility of subjective (reported by a person with Parkinson's Disease, PwP) or objective (digital health) information.

Methodology:

Clinicians completed an online questionnaire with 15 vignettes describing patient cases of PwP where information type (subjective, objective, subjective and objective) and symptoms / signs were manipulated whilst disease stage, duration and patient demographics were kept constant. Dependent variables were the likelihood of changing the care plan and the confidence in the decision. We also recorded the willingness to rely on subjective or objective information.

Results:

Clinicians were equally likely to change the care plan and were equally confident in their decision when receiving information from self-reports or the digital health devices' outcomes. The likelihood for change increased when both information sources provided consistent information. However, inconsistent information from both sources did lead to more conservative decision making, that is, clinicians were more reluctant to change the care plan.

Conclusions:

Clinicians consider digital health information equally as useful and trustworthy as patients' self-reports for their care plan decisions. This finding corroborates the potential utility of wearable technology and mobile devices for symptoms' monitoring. Facilitating clinician's feedback on situations where subjective and objective sources provide conflicting information is an important consideration for the development and improvement of clinical decision support systems (DSS).

Key messages:

- It would be important to identify conditions and mechanisms that could give rise to this conflicting information and the impact that that could have on patient care.
- Guidelines (e.g., more frequent appointments to monitor the situation) could then be put in place to deal with these situations.

Perceived health and quality of life in chronic and end-stage kidney disease

Karine Legrand

K Legrand[1,2], E Speyer[3], B Stengel[3], L Frimat[2,4], W NGUEYON SIME[1], S Briançon[1], C Ayav[1]
[1]INSERM, CIC, Epidémiologie Clinique, CHRU-Nancy, Nancy, France
[2]APEMAC, Université de Lorraine, Nancy, France
[3]Centre for Research in Epidemiology and Population Health, University Paris-Saclay, University Paris Sud, UVSQ, Inserm UMRS 1018, Villejuif, France
[4]Nephrology Department, CHRU-Nancy, Vandoeuvre les Nancy, France
Contact: k.legrand@chru-nancy.fr

Background and objectives:

Health-related quality of life (HRQoL) is increasingly considered a major outcome in patients with chronic kidney disease (CKD), but the size of its effect on physical and mental health at different disease stages, compared with the general population, is unclear.

Design, setting, participants, and measurements:

We compared HRQoL measures in four groups: 2,687 outpatients with moderate (stage 3, estimated glomerular filtration rate [eGFR] 30-60 mL/min/1.73 m2) or advanced (stage 4-5, eGFR < 30 mL/min/1.73 m2) CKD under nephrology care from 40 nationally representative facilities, 1,658 patients with a functioning graft, 1,251 dialysis patients randomly selected from the national REIN registry, and 20,574 participants in the French Decennial Health Survey, representative of the general population.

Results:

Mean age (years) was 67, 69, and 55 in patients with non-end-stage CKD, on dialysis, or with transplants, respectively; 60% were men. Age- and gender-standardized health status was perceived as fair or poor in 27% of those with moderate CKD and more than 40% of those with advanced CKD and those on dialysis, compared with 12% in transplant patients and 3% in the general population. Compared with the general population, HRQoL physical scores adjusted for age, gender, education, obesity, and diabetes, were significantly lower, by a factor of 2.2 among patients with moderate CKD, 4.1 among those with advanced CKD, 10.2 among those on dialysis, and 4.1 among those with transplants. The effect was stronger for those younger than 65 years. The mental score was lower only for dialysis patients.

Conclusions:

This study highlights the importance of the physical health effects beginning at the moderate stage of CKD. More attention to patients' CKD-related perceived health is needed.

Key messages:

- Physical health declined significantly from moderate through end-stage CKD, with impact greatest among the youngest patients.
- More attention to CKD's impact on quality of life is needed.

Development of ethical governance framework for an mHealth platform for the management of Parkison's

Lada Timotijevic

L Timotijevic[1], M Peacock[1], C Hodgkins[1], BM Egan[1]
[1]Psychology, Food Consumer Behaviour and Health Research Centre, Surrey, UK
Contact: l.timotijevic@surrey.ac.uk

Background:

The ubiquity of mobile devices promises to address the need for continuous management of chronic conditions at lower costs. Its rapid expansion, particularly in public health, is currently largely consumer-driven and lacking in acceptable frameworks for its wider adoption into the healthcare systems. The aim of this study is to identify the key parameters to consider in developing a governance framework for a Parkinson's Disease Management MHealth platform. The Parkinson's Disease Manager (PDM) system was developed to gather symptom information from patients with PD via wearable devices and a specially designed app and stored securely in a cloud, for use by clinicians, health researchers and policy makers.

Methodology:

Twelve stakeholders were interviewed in the UK including clinicians, data managers, the public. First, the participants' existing views about sharing personal and then specifically health data online were explored. Secondly, participants were introduced to PDM via a diagram and encouraged to explore the risks and benefits of the system with a minimum of guidance. Finally, they were asked what risks they thought might be posed by a series of specific scenarios presented through vignettes and how such issues might be addressed.

Results:

Thematic analysis identified eight emerging themes which clustered around two overarching categories: 1. The key challenges of the system identified included: Establishing appropriate governance; Protecting the data; Ensuring sustainability; Building trust; 2. The proposed solutions included: Ethically informed governance; Embedded data custodians; Sustainable funding and engagement; Trust through transparency.

Conclusions:

The patient's heuristic assessment of risks and benefits is mediated by trust, which can be initially gained by association with individuals and organisations already deemed trustworthy and then consolidated and sustained through transparency and delivering on promises.

Key messages:

- The effective system design, must ensure that standards of transparency, data protection and informed consent are upheld if the coming eHealth revolution is ever to realise its true potential.
- The use of diagrams and vignettes to support qualitative interviews helped elucidate the importance of balancing protection, utility and sustainability to build and maintain trust.

A Developmentally Appropriate Patient Education during Transition

Maxime Morsa

RG Gagnayre[1], PL Lombrail[1]
[1]Laboratory of Health Education and Practice, University Paris 13, Bobigny, France
Contact: maximemorsa@hotmail.com

Introduction:

Patient education is recommended to improve transition from pediatric to adult care for young people living with chronic conditions. But a consensus has not been reached regarding a particular model. Our study aims to understand how to implement a Developmentally Appropriate Patient Education during Transition (DAPET), which would revolve around the young people's psychosocial development.

Methods:

Three focus groups were organized with healthcare providers and two focus groups took place with the parents of young people with chronic conditions. We relied on Activity Theory to explore practices and to identify obstacles, as well as recognize which resources were available to implement a DAPET.

Results:

Six themes were identitified via the thematic analysis. In summary, healthcare providers agreed on the need to engage in an educational approach centered on the psychosocial development of young people during transition. They did, however, highlight a lack of competencies in adolescent and young adult medicine and a lack of available resources to meet these goals. The parents wanted to redefine their role with healthcare providers in order to apprehend transition to adult care and to allow their children to develop self-management skills.

Conclusions:

Healthcare providers and parents considered the implementation of a DAPET to be acceptable and even advisable. However, this program's feasibility was questioned due to the perceived shortfalls of the hospital system as it currently stands and the ways in which an educational approach would be applied. An enabling environment is therefore required to facilitate the educational initiatives of healthcare providers and to encourage the participation of parents. The means and modalities for achieving this are discussed.

Key messages:

- Patient Education during transition from pediatric to adult care need to be developmentally appropriate.
- Healthcare providers need en enabling environment to carry on a developmentally appropriate approach during transition.

FC Prostate - Football for men with prostate cancer in local football clubs

Christian Doesing Soerensen

CD Soerensen[1]
[1]Danish Commitee for Health Education, København, Denmark
Contact: cds@sundkom.dk

Prostate cancer is the most frequent cancer found in men. Physical activity has shown to counteract some unwanted psychological and physiological side-effects, however sustainable exercise concepts have been hard to achieve.

Since 2011 Danish researchers from The University Hospitals' Center for Health Research have tested, evaluated, and developed football training for men with prostate cancer. In the period 2011-2017 FC Prostate was conducted in three phases (I-III). Pilot study (I), a small scale randomized controlled trial (II), and the FC Prostate Community (III) conducted in a real-world setting in six Danish football clubs. Researchers found that participants who played football once a week or more improved their mental health and reduced fat mass. For some men with prostate cancer, football proved to be a sustained, and viable alternative to other types of physical rehabilitation.

Based on these research results the ambition in phase IV is to offer FC Prostate nationally. This task was undertaken by The Danish Health Committee (DCHE) and The Danish Football Association (DBU). During the period 2018-2019 DCHE and DBU have collaborated to initiate and implement local partnerships around each of the currently 20 active FC Prostate-teams in Denmark (spring 2019). DCHE have developed a simple model of collaboration. The model contains a clear division of relevant tasks and outlines a meaningful collaboration between municipal rehabilitation centers, hospitals, and local football club to run locally based FC Prostate-teams; covering such tasks as recruitment, training, and retention of men with prostate cancer in an active life style.

The main focus of the presentation will be the national implementation of FC Prostate, including experiences and identified barriers during the project, and expected outcomes based on the project development so far.

Key messages:

- Local club-based football is a viable alternative to other types of physical rehabilitation.
- Rehabilitation centers and hospitals are currently collaborating with local club to host and run FC Prostate-teams in Denmark.

A cross sectional survey to estimate prevalence of asthma in Reunion Island, Indian Ocean

Jamel Daoudi

JLS Solet[1], *CRS Raherison-Semjen*[2], *EM Mariotti*[3], *YLS Le Strat*[4], *AG Gallay*[4], *EB Bertrand*[5], *NJ Jahaly*[6], *LF Filleul*[1]

[3]Statistical Unit, Indian Ocean Health Agency, Saint-Denis, La Réunion
[4]The French Public Health Agency, Saint-Maurice, France
[5]Syntheses Reunion, Synthesis Analysis Office, Saint-Denis, La Réunion
[6]Syntheses Mauritius LTD, Synthesis Analysis Office, Quatre-Bornes, Mauritius
Contact: jamel.daoudi@santepubliquefrance.fr

Background:

Previous studies on asthma mortality and hospitalizations in Reunion Island indicate that this French territory is particularly affected by this pathology. However, no estimates are provided on the prevalence of asthma among adults. In 2016, a cross-sectional survey was conducted to estimate the prevalence of asthma and to identify its associated factors in the adult population of Reunion Island.

Methods:

A random sample of 2,419 individuals, aged 18-44 years, was interviewed by telephone using a standardized, nationally validated questionnaire. Information was collected on the respiratory symptoms, description of asthma attacks and triggering factors for declared asthmatics, as well as data on the indoor and outdoor home environment. ''Current asthma'' was defined as an individual declaring, at the time of the survey, having already suffered from asthma at some point during his/her life, whose asthma was confirmed by a doctor, and who had experienced an asthma attack in the last 12 months or had been treated for asthma in the last 12 months. ''Current suspected asthma'' was defined as an individual presenting, in the 12 months preceding the study, groups of symptoms suggestive of asthma consistent with the literature.

Results:

The estimated prevalence of asthma was 5.4% [4.3-6.5]. After adjustment, women, obesity, a family member with asthma, tenure in current residence and presence of indoor home heating were associated with asthma. The prevalence of symptoms suggestive of asthma was 12.0% [10.2-13.8]. After adjustment, marital status, passive smoking, use of insecticide sprays, presence of mold in the home and external sources of atmospheric nuisance were associated with the prevalence of suspected asthma.

Conclusions:

Preventive actions including asthma diagnosis, promotion of individual measures to reduce risk exposure as well as the development of study to improve knowledge on indoor air allergens are recommended.

Key messages:

- Individuals with suspected asthma who have not been medically diagnosed have been identified. Consequently, the development of a strategy to improve the diagnosis of asthma on Reunion is recommended.

- Aerating homes to reduce indoor moisture and mould growth, maintaining hygiene standards through cleaning, limiting the use of spray insecticides and household cleaning sprays at home.

4.H. Skills building seminar: How to enhance collaboration between primary care and public health?

Organised by: Observatory
Chair persons: Matthias Wismar - European Observatory
Contact: bernd.rechel@lshtm.ac.uk

Many countries in Europe and beyond have recognized that improved collaboration between public health and primary care can yield substantial benefits to populations and patients (e.g. through improved chronic disease management, communicable disease control, and maternal and child health), but it is in practice unclear how this improved collaboration can be achieved. Furthermore, collaboration is often hampered by the way that both sectors are organized and financed, with substantial differences across and sometimes within countries. In most European countries primary care already performs some public health functions, while public health can help to make the provision of primary care more effective. Screening and immunization, for example, as well as interventions to support healthy lifestyles, are public health functions that are nowadays commonly provided in primary care, although with wide variations between countries in the number of preventive care services provided in primary care. The question is how to expand and further develop existing collaborations.

This workshop investigates the types of initiatives that have been undertaken, the factors that can enhance or hinder the collaboration between primary care and public health, and what can be undertaken to increase the chances of successful collaboration. It identifies organizational models of primary care that are conducive to collaboration with public health (e.g. through integrating primary care and public health in the provision of care for individuals), as well as systemic, organizational and interpersonal factors that can hinder or facilitate collaboration.

The workshop draws on the findings of a forthcoming Observatory policy brief on enhanced primary care and public health collaboration, covering such areas as community engagement and participation, health promotion, health education, prevention activities, chronic disease management, screening, immunization and communicable disease control, information systems activities, development of best practice guidelines, conducting needs assessments, quality assurance and evaluation, and professional education.

The workshop will begin with a presentation of the main findings of the policy brief, followed by a panel discussion involving European experts and policy-makers. In addition to sharing the experience of their countries, panelists will reflect on how generalizable or transferable examples of successful collaboration are and what it takes to overcome existing barriers. The workshop is designed to provide ample opportunity for the audience to comment on and discuss presentations and the contributions of panelists and to consider what lessons can be transferred across countries. It will be of interest to public health researchers, practitioners and policy-makers from across Europe.

Key messages:

- The workshop provides a forum for discussing how to enhance collaboration between public health and primary care.
- It explores innovative approaches, organizational models, and policy options.

How to enhance collaboration between primary care and public health?

Bernd Rechel

B Rechel[1]
[1]European Observatory on Health Systems and Policies, LSHTM, London, UK
Contact: Bernd.Rechel@lshtm.ac.uk

Background:

There are almost universal calls for improved collaboration between public health and primary care, but it is less clear how this can be achieved in practice. This presentation summarises key findings from an Observatory policy brief on how to enhance collaboration.

Methods:

The policy brief iss based on a systematic review of the academic literature on collaboration between public health and primary care, searching the databases Medline and Embase for articles published since 2010. After title, abstract and full-text screening, 46 articles were retained and included in the review.

Results:

Most academic articles on collaboration between primary care and public health are concerned with the United States and Canada. From the European countries, the Netherlands and the United Kingdom are most strongly represented. There is also a very uneven timeline in publication, with a spike in articles published in 2012, following an influential Institute of Medicine report. Research has identified organizational models of primary care that are conducive to collaboration with public health, as well as systemic, organizational and interpersonal factors that can facilitate or hinder collaboration. However, the relative importance of these factors remains poorly understood. Improved collaboration between public health and primary care promises to bring major benefits, but these are rarely documented in the literature so far. Furthermore, collaboration may also bring certain risks, such as competition over scarce resources.

Conclusions:

The literature on collaboration between public health and primary care points to many illustrative examples, but also identifies relevant principles and factors that can hinder or facilitate collaboration. Policy interventions to improve collaboration will need to be mindful of potential risks and should aim to demonstrate benefits, which will help to increase buy-in from primary care and public health professionals and the public.

4.I. Antimicrobial resistance and health care associated infections (HAI)

Does practice characteristics explain the impact of a financial incentive on antibiotic prescribing?

Philip Anyanwu

P Anyanwu[1], *C Costelloe*[1]
[1]Primary Care and Public Health, Imperial College London, London, UK
Contact: p.anyanwu@imperial.ac.uk

Background:

About 80% of the antibiotics prescribed in England are from primary care practices. The Quality Premium (QP) initiative that offers financial rewards on the quality of specific health services commissioned is one of the NHS England interventions to reduce antimicrobial resistance through reduced prescribing. Evaluations of the initiative suggest a reduction in antibiotic prescribing in primary care. We investigated whether the effect of this financial incentive on antibiotic prescribing is explained by variations in practice characteristics that can contribute to differences in antibiotic prescribing.

Methods:

We used monthly prescribing data for 6,600 practices in England from NHS Digital for the year from April 2015 when antibiotic improvement was included as a QP priority and the preceding year. We fitted an initial linear generalised estimating equations model examining the effect of the incentive on antibiotic items/STAR-PU prescribed, adjusting for seasonality and number of months since implementation. We examined the consistency of the effect after the initial model was adjusted for variations in workforce, prevalence of co-morbidities (asthma, COPD, cancer, chronic kidney disease, diabetes), and deprivation index.

Results:

Antibiotics prescribed in primary care practices in England reduced by 0.20 items/STAR-PU (95% CI:0.19-0.21) after the implementation of the initiative. This reduction flattened off in the following months with a month-on-month increase of 0.013 items (95% CI:0.012-0.013). After adjusting for practice characteristics, the immediate and month-on-month impacts remained consistent with slight attenuation of the immediate impact (0.18, 95% CI:0.17-0.18). Subgroup analyses showed the effect of the initiative was significantly more among 20% top prescribers.

Conclusions:

Variations in practice characteristics are not a major explanation for the impact of the quality premium initiative on antibiotic prescribing in primary care practices in England.

Key messages:

- Our findings on the targeted impact of a financial incentive scheme to improve antibiotics prescribing on high prescribers are important to policymakers and antibiotic stewardship programs.
- Variations in practice characteristics are not a major explanation for the impact of a financial incentive scheme on antibiotics prescribing in primary care practices in England.

Multimodal Surveillance of HAI in an Intensive Care Unit of a Large Teaching Hospital

Giuseppe Migliara

G Migliara[1], *C Di Paolo*[1], *D Barbato*[1], *V Baccolini*[1], *C Salerno*[1], *A Nardi*[1], *A Cottarelli*[1], *C Marzuillo*[1], *M De Giusti*[1], *P Villari*[1]
[1]Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy
Contact: gmigliara@gmail.com

Background:

Healthcare associated Infections (HAIs) represent a significant burden in terms of mortality, morbidity, length of stay and costs for patients in intensive care units (ICU). Surveillance systems are recommended to gather data in order to elaborate and evaluate intervention to reduce HAIs risk. Here we describe results of the multimodal surveillance system implemented in the ICU of a large teaching hospital in Rome from April 2016 to October 2018.

Methods:

The surveillance system integrated four different approaches: i) active surveillance focused on inpatients; ii) environmental microbiological surveillance; iii) surveillance focused on isolated microorganisms; iv) behavioral surveillance of the healthcare personnel. The system included the molecular genotyping of bacterial isolates through the pulsed field gel electrophoresis (PFGE). Moreover, an intervention to improve personnel adherence to hand hygiene (HH) guidelines was conducted.

Results:

Overall, 773 patients were included in the surveillance. The global incidence rate of the device related HAIs was 14.1 (95%CI: 12.2-16.3) per 1000 patient day. Monthly device related HAIs incidence rate showed a decreasing, from 26.9 per 1000 patient day in October 2016, to 4.9 in September 2018. The most common bacterial isolate was K. pneumoniae (20.7%), the 94.0% of which were multidrug-resistant. A total of 305 environmental bacterial isolates were retrieved and the most frequent was A. baumannii (27.2%), that was always multidrug-resistant. Genotyping showed a limited number of major PFGE patters in clinical and environmental isolates. Behavioral compliance to HH guidelines improved after the educational intervention.

Conclusions:

The data showed an overall slight decrease over time of the adjusted risk HAIs rates. Through the integration of information gathered from the four approaches, the application of this model returns a precise and detailed view of the infectious risk and of the microbial ecology of the ICU.

Key messages:

- Multimodal surveillance systems are effective to monitor HAI incidence and to determine the infectious risk.
- Genotyping techniques allows to characterize and link the clinical and environmental isolates.

Modeling Carbapenemase-producing Enterobacteriaceae episodes' evolution in France over 2010-2020

Jonathan Roux

J Roux[1], *N Nekkab*[2,3], *P Astagneau*[4], *P Crépey*[1]
[1]REPERES - EA 7449, University of Rennes, EHESP, Rennes, France
[2]Laboratoire MESuRS, Conservatoire National des Arts et Métiers (CNAM), Paris, France
[3]Unité PACRI, Institut Pasteur, CNAM, Paris, France
[4]CPias Ile-de-France, Assistance Publique-Hôpitaux de Paris, Faculté de Médecine Pierre & Marie Curie, Sorbonne Université, Paris, France
Contact: jonathan.roux@ehesp.fr

Background:

Incidence of Carbapenemase-Producing Enterobacteriaceae (CPE) episodes within hospitals is rising at an alarming rate and threaten health systems and patient safety worldwide. Their number is growing in France since 2009 associated with inter-regional dissemination and importation of international cases. This study aimed at describing the dynamics of CPE episodes in France over 2010-2016 and forecasting their evolution for 2017-2020.

Methods:

Surveillance data of CPE episodes (imported and non-imported) from August 2010 to November 2016 were issued from the French national Healthcare-Associated Infections Early Warning and Response System. Impact of seasonality on the number of CPE episodes was analyzed using seasonal-to-irregular ratios. Seven models issued from time series analysis and three ensemble stacking models (average, convex and linear stacking) were used to describe and forecast CPE episodes. The model with the best forecasting's quality was then trained on all available data (2010-2016) and used to predict CPE episodes over 2017-2020.

Results:

Over 2010-2016, 3,559 CPE episodes were observed in France. Compared to the average yearly trend, we observed a 30% increase in the number of CPE episodes in September and October. On the opposite, a decrease of 20% was noticed in February compared to other months. We also noticed a 1-month lagged seasonality of non-imported episodes compared to imported ones. The number of non-imported episodes appeared to grow faster than imported ones starting from 2014. Average stacking gave the best forecasts and predicted an increase over 2017-2020 with a peak up to 345 CPE episodes (95% PI [124-1,158], 80% PI [171-742]) in September 2020.

Conclusions:

The number of CPE episodes is predicted to rise in the next years in France because of non-imported episodes. These results could help public health authorities in the definition and evaluation of new containment strategies.

Key messages:

- Time series modeling predicts an increase in the number of CPE episodes in France in the next few years with a quicker rise of non-imported episodes.
- An increase of 30% in the number of CPE episodes was observed in September and October with a 1-month lagged seasonality impact of non-imported episodes compared to imported one.

Risk factors for E. coli Susceptibility in Bloods Stream Infections in England Between 2013-2017

Shirin Aliabadi

S Aliabadi[1], K Honeyford[1], E Jauneikaite[1], B Muller-Pebody[2], C Costelloe[1]
[1]Department of Primary Care and Public Health, Imperial College London, London, UK
[2]HCAI and AMR Department, Public Health England, London, UK
Contact: shirinjune71@gmail.com

Antimicrobial resistance (AMR) is a significant threat to global health. Escherichia coli is a frequent cause of Gram-Negative Bloodstream Infections (GNBSIs) and a key organism that contributes to the burden of AMR. This was a cross-sectional surveillance study that looked at 154,791 isolates between 1st January 2013 and 31st December 2017. Analysis was performed using routine surveillance data from Public Health England (PHE) containing data on the incidence and susceptibility results of E. coli bacteraemia. Exposure variables extracted were potential risk factors for AMR. The outcome variable was resistance to at least one antibiotic. Descriptive statistics and graphs were used to summarise the data. Associations between variables and the resistance to at least one antibiotic were assessed using univariate logistic regression. A multivariable logistic regression examined adjusted associations between the variables and resistance to at least one antibiotic. The final model included variables that showed strong evidence of association with resistance to at least one antibiotic. 43.2% of isolates were resistant to at least one antibiotic. Logistic regression showed an association between resistance of E. coli isolates to at least one antibiotic and children of school age (1.39 OR, 95% CI: 1.18-1.64; $p \leq 0.001$), isolates taken from patients in Greater Manchester (1.50 OR, 95% CI: 1.41-1.60; $p \leq 0.001$) and isolates taken from male patients (1.14 OR, 95% CI: 1.11-1.17; $p \leq 0.001$), on adjustment. Visual assessment of trend graphs showed a decrease in resistance for common carbapenems and piperacillin/tazobactam. Prevalence of resistance has increased for common cephalosporins, gentamicin, and co-amoxiclav. Initial analyses suggest an increase in rates of E. coli resistance to at least one antibiotic in GNBSIs between 2013 and 2017 in England. Findings of this study have implications for appropriate antibiotic prescribing guidelines and for directing future AMR policies.

Key messages:

- Initial analysis of the dataset suggests that rates of AMR of E. coli in BSIs have increased between 2013 and 2017.
- There is evidence of an increase in E.coli infections that are resistant to cephalosporins over time and a decrease in E.coli infections that are resistant to carbapenems.

The PACASurvE laboratory network for real-time infection surveillance and alert at a regional scale

Philippe Colson

PC Colson[1], AGG Giraud-Gatineau[1], OD Diallo[1], JMR Rolain[1], PE Fournier[1], HC Chaudet[1], DR Raoult[1]
[1]IHU Mediterranee Infection, Marseille, France
PACASurvE PACASurvE network
Contact: philippe.colson@univ-amu.fr

Background:

Detection of abnormal phenomena is a key element of surveillance of infectious. Tools that count systematically in real-time infection-related parameters are needed. We implemented since 2002 a weekly monitoring system of infections based on clinical microbiology/virology laboratory data that expanded since 2013 to the Provence-Alpes-Côte d'Azur region (PACA), Southeastern France, through a laboratory network (PACASurvE). We describe its current extent.

Methods:

Microbial/virological diagnoses data were collected weekly from public/private medical biology laboratories (MBL) located in PACA (4.9 million inhabitants) and comprising the PACASurvE network. These data corresponded to counts of clinical samples, tests and positive diagnoses, and were anonymously integrated into an SQL database and analyzed with R/PHP. Alerts were automatically generated if weekly counts were above statistically-determined thresholds.

Results:

In March 2019, PACASurvE included weekly MBL from 17 hospital centers and 285 private MBL. Apart from Marseille public hospitals and regarding diagnoses by microbial culture, mean participation time was 3.3±1.6 years and 2,959,891 samples and 853,785 microbial isolates had been analyzed. For the whole network, 987 different microbial species were isolated during the 2013-2018 period. Besides, data for 110 other tests than microbial culture performed between 2014 and 2018 in 374 private MBLs to diagnose bacterial ($n = 50$), viral (58) or parasitic (2) infections were collected. These tests involved 157,161 patients and were positive for 17,412. Overall, dozens of alerts were generated weekly for clinical samples or pathogens and some triggered investigations and reporting.

Conclusions:

PACASurvE is a powerful tool to measure weekly the true incidence of infections in various clinical settings at a region scale. It alerts on abnormal rises, triggers investigations and reporting, and helps managing infections in a responsive manner.

Key messages:

- The PACASurvE network currently covers the majority of hospital laboratory and about half of private medical biology laboratories in PACA region.
- PACASurvE is a powerful tool to measure weekly the true incidence of infections, alert on abnormal rises, and trigger investigations and reporting.

4.K. Round table: Toward a better living with schizophrenia

Organised by: EUPHA (PMH)
Chair persons: Jutta Lindert - EUPHA (PMH)

According to the Global Burden of Disease Study, schizophrenia causes a high degree of disability, which accounts for 1.1% of the total DALYs (disability-adjusted life years) and 2.8% of YLDs (years lived with disability). In the World Health Report [The WHO World Health Report: new understanding, new hope, 2001. Geneva]. In addition to the direct burden, there is considerable burden on the relatives who care for the sufferers. The workshop aimed to present and discuss different facets of what could be done for these persons and their families' members in the light of what has been done in some European countries, which have conducted reforms.

The round table will be introduced by presentations from two countries very much involved in psychiatric reforms which will present their attempts and results: first Italy with its emblematic radical deinstitutionalization model setting up a law to close down the psychiatric hospitals. The to-day situation will be presented underlying the huge diversity across Italian provinces and the dramatic lack of resources in some of them. Second the Portuguese reform will be described with a shift of psychiatric care toward general hospitals and its complete integration into health care catchment areas resulting in a increase of out patient acts among them home visits and a decrease of full time hospital admissions.

Then a French three-year research program that focused on themes that aims to improve the every day well-being of people living with schizophrenia will be presented. This program aimed to provid new insights on their integration from different angles: information about the disease by doctors at diagnostic annoucement, on internet and actions to take on health administrator training against stigmatisation that could be extended to a larger public.

Lastly the program allowed to interviewed face to face up to 67 people: 20 persons with schizophrenia, 20 person with bipolar disorders and 27 close ones to schizophrenic patients. A semi-structured interview collected information on the different aspects of care experiences plus "The Brief Illness Perception Questionnaire" allowed to measure and compare perceptions of the disease. This will allow to present the very positive effects of a program toward family members and patients themselves: "psychoeducation" that is a structured educationnal intervention which provides information and guidelines on how to react with their family member and influences positively the patient's outcome as the well being of both patient and family members.

Each presentation will extensively be discussed with the attendance and followed by some recommandations

Key messages:

- Although schizophrenia is a severe disorder much could be done to alleviate the burden on the patients and their family members.
- Reorganising the care systems trough adequate policies, setting up policies against stigmatisation and providing educational intervention should promote patients and families empowerment.

Community Mental Health Care in Italy: Basaglia's ashes in the wind of the crisis of the last decade

Mauro Giovanni Carta

M Carta[1]
[1]Liaison Psychiatric and Psychosomatic Unit, Cagliari University Hospital, Cagliari, Italy
Contact: mgcarta@tiscali.it

Introduction:

In 1978, Italy approved the Law 180, which required the closure of all psychiatric hospitals. The three key points were: 1) A ban on the building of new psychiatric hospitals; 2) The principle that prevention, treatment, and rehabilitation have to be provided in community services; 3) The reason for requiring involuntary treatments was no longer dangerousness: involuntary treatments could only be required if a person needed an urgent treatment and he or she did not have - in that particular moment - the capacity for taking a decision.

Discussion:

Regional differences. The 1978 law has been "translated" into regional policies. The resources allocated to implement these policies were higher in the North and lower in the South Italy. The access to services and, thus, the health outcomes were found to be related to the availability of resources.

Decreases in resources:

Furthermore, the total amount of resources for the national mental health system in Italy shows a constant decrease from 2001 to date. Considering the percentage of mental health expenditure on the total public health expenditure, today the European countries with an income similar to Italy spend 10% of their health budget for mental health; Italy spends half of it. In this new scenario, the Italian associations of users and families have denounced abuses during involuntary health treatments and in the so-called shelter-houses.

Lack of a scientific approach. Another critical point of the reform is the poor scientific testimony of what has been done.

Conclusions:

Italy created a revolutionary approach to mental illness in a historical framework in which this country was in economic expansion and produced a great cultural expression. At that time, we were accustomed to 'believing and doing' rather than to questioning results. With the economic and cultural crisis, Italy has guilty neglected mental health.

Any future humanitarian approach to mental health should take this experience into account.

Improving access to integrated mental health services in community-based settings in Portugal

Graça Cardoso

G Cardoso[1]
[1]Chronic Diseases Research Centre (CEDOC), Universidade NOVA de Lisboa & Lisbon Institute of Global Mental Health, Lisbon, Portugal
Contact: gracacardoso@gmail.com

Background:

Scientific evidence has proven greater effectiveness of community-based mental health care offering a diversity of services. Among the main barriers to mental health treatment are difficulties in the access and poor integration with general health services.

Description of the problem:

The current Portuguese National Mental Health Plan promoted the transition from psychiatric hospital-based care to care provided by a network of services in the community with the inpatient unit in the local general hospital. In this presentation we will describe the main aspects of the mental health reform and some figures illustrating the functioning of one of the new mental health departments.

Results:

Since 2006 three large psychiatric hospitals were closed and mental health departments are now in place according to the new model.

One example, the HFF department of psychiatry, has developed an innovative comprehensive and integrated model based in the general hospital and the community, ensuring a close coordination with primary care teams and all other relevant stakeholders in the community, offering diverse answers to patients' needs, and preventing drop-outs.

Between 2000 and 2011, the number of admissions went from 486 to 451, first admissions from 40% to 36%, and the average number of patients treated in day hospital from 12 to 24. Liaison psychiatry consultations (2713 to 3684), community teams' visits (10,201 to 14,756), and home visits (236 to 980) have increased significantly, while rehabilitation programs were developed in two day centers in the community.

Conclusions:

The Portuguese model of mental health care, based on the principles of accessibility and equity, community involvement, recovery and human rights, and continuity of care, has promoted greater accessibility, higher quality of care, and less stigma. An important integration of mental health and general health services has taken place allowing for a close collaboration between services.

Toward a Better Living with Schizophrenia

Viviane Kovess-Masfety

V Kovess-Masfety[1,2]
[1]Métis, EHESP, Paris, France
[2]EA4057, Paris Descartes, Paris, France
Contact: vkovess@gmail.com

"Toward a Better Living with Schizophrenia" is a French three-year research program that focuses on themes that aims to improve the every day well-being of people with schizophrenic psychoses by providing new insights on their integration:

-The announcement of the diagnosis to the person herself and/ or to the close ones:the positive consequences of a sound information and recommendations for a strategy.

-The search for information on the internet: persons living with Schizophrenia are using the web to gather information on their problems and on treatment ; some recommendations were listen to secure and improve web sites.

-How a short training of French health authorities staff members not involved in patients care, could decrease significantly their negative vision of such persons.

-67 people were interviewed face to face: 20 persons with schizophrenia, 20 person with bipolar disorders and 27 close ones to schizophrenic patients. A semi-structured interview concerned: the availability of staff, their feelings during the hospitalization and at discharge, the offer of psychoeducation; "The Brief Illness Perception Questionnaire" allows to measure and compare perceptions of the disease: its duration, prognostic, compliance, stigma and the beliefs about the causes of schizophrenia.

Results show less threatening perceptions of the disease for the persons themselves than for close ones. A better access to diagnosis is associated with a shorter perceived probable duration of the disease, while an easier communication with healthcare professionals is associated with the perception of a better efficiency of the treatment. Family psycho-education is associated with the perception of less frequent symptoms of the person.

These results will help to better integrate families, who seem to feel relatively isolated and shut down in the healthcare process, despite the strategic role they could play and despite the many recommendations of public health policies in that matter.

Effect of family psychoeducation and access to information on illness negative perceptions: a study on French families of persons experiencing schizophrenia

Murielle Villani

M Villani[1]
[1]EA4057, Paris Descartes, Paris, France
Contact: muriellevillani@gmail.com

Background:

A better understanding of schizophrenia, a chronic disease often leading to heavy negative consequences both on users and families, has been shown to reduce those difficulties. Studies recommend family psychoeducation, as this structured educative intervention reduces parents' depressive symptoms, enhances family mood, and decreases risks of relapse for users. Our objective is to assess whether family psychoeducation and access to information has an effect on close relatives' illness negative perceptions.

Methods:

Our sample consists in 27 close relatives of persons with schizophrenia. We used a semi-structured interview assessing access to psycho-education and information about illness and diagnosis. We also used the Brief Illness Perception Questionnaire, which explores various illness negative perceptions, as well as probable causes of the illness.

Results:

A better access to diagnosis for families is associated with a shorter perceived probable illness duration ($p = .044$). Family psychoeducation programs, followed by 38,5% of close relatives, reduces their perception of the frequency of user's present symptoms ($p = .029$). This could be caused by a better understanding of real symptoms, or by an enhancement of family mood. Also, family psychoeducation has an effect on causal attributions: 50% of close relatives with access to family psychoeducation believed in a substance abuse causality, opposed to 12,5% of the others ($p = .036$).

Conclusions:

Family psychoeducation could help allowing a shift in causal attributions and more generally enhancing family reaction to the disease, which, in turn, can have an impact on the user's recovery process. Thus, this intervention deserves more attention and should be more systematically proposed to French families, alongside with an easier access to information.

4.L. Innovative care for older adults

The Nordic @geing Online project: Co-creating a social application together with older adults

Johanna Nordmyr

J Nordmyr[1], *AK Forsman*[1]
[1]Health Sciences, Faculty of Education and Welfare Studies, Åbo Akademi University, Vaasa, Finland
Contact: johanna.nordmyr@abo.fi

Background:

Online resources present various possibilities for health promotion, also in the growing older adult population. Tailored online services aiming to support social participation among users could potentially promote older adults' psychosocial health. In the @geing Online project an online application is developed, focusing on access to meaningful social activities among older adults in rural areas in Finland and Sweden. The innovation project (2017-2020) is funded by the Interreg Botnia-Atlantica programme (European Regional Development Fund).

Methods:

A collaborative, user-centred design approach is applied when developing the online application, allowing older potential users and personnel groups from the social and health care sector to evaluate application features in a step-wise process. The inclusion of personnel groups allows for the exploration of the feasibility of introducing the tool in home care services and similar relevant contexts from an organizational perspective. Further, the inclusion of regional IT-companies presents opportunities for them to develop their competence regarding eHealth tools and older adults as a target group.

Results:

An advanced prototype of the application and its core features is presented. Promising approaches and outcomes regarding the co-creation methods applied to ensure the involvement of stakeholders in the development process are elaborated upon. Challenging issues related to the project theme, such as stereotypical and negative views of older adults' competences and motivation related to application use are also discussed.

Conclusions:

The project highlights possibilities - but also challenges - when co-creating a social application together with older adults, some of whom have no experience in internet use. The gathered project outcomes will provide lessons on the potential of new technologies for delivering health promotion initiatives among older adults.

Key messages:

- Tailored online services aiming to support social participation among users provide possibilities for promoting psychosocial health in the growing population of older adults.
- Application development utilizing a user-centered design approach can be implemented even if the end-users are not familiar with the internet or application use.

Neighborhood walkability related to knee and low back pain for older people: A multilevel analysis

Daichi Okabe

D Okabe[1], T Tsuji[2], M Hanazato[2], N Asada[1], K Kondo[2,3]
[1] Advanced Preventive Medical Sciences, Chiba University, Chiba, Japan
[2] Center for Preventive Medical Sciences, Chiba University, Chiba, Japan
[3] Center for Gerontology and Social Science, National Center for Geriatrics and Gerontology, Aichi, Japan
Contact: daichiokabe01@gmail.com

Background:

Previous research has linked built environments to physical activity. However, the association between built environments and musculoskeletal pain is unknown. This study aimed to investigate the effects of neighborhood walkability as a built environment on the knee and low back pain for older people.

Methods:

Data were from the Japan Gerontological Evaluation Study (JAGES) 2013, a population-based study of independent people from aged 65 and older. A cross-sectional multilevel analysis was performed on 22,892 subjects in 792 neighborhoods. We used neighborhood walkability as regional level residents' perception of access to parks and sidewalks and fresh food stores and difficulty in walking due to slopes and stairs and population density. Knee and low back pain which restrict daily life within the past year were our objective variables.

Results:

The prevalence of knee pain was 26.2 %, and that of low back pain was 29.3 %. Neighborhood walkability was positively associated with knee and low back pain after adjusting for individual confounders and mediators such as physical activity, a quarter increased perception of access to parks and sidewalks decreased the prevalence of knee pain (PR: 0.85, 95% CI: 0.77-0.94), a quarter increased perception of access to fresh food store decreased the prevalence of knee and low back pain (PR: 0.90, 95% CI: 0.84-0.96, PR: 0.92, 95% CI: 0.86-0.98), a quarter increased population density decreased the prevalence of knee and low back pain (PR: 0.95; 95% CI: 0.93-0.98, PR: 0.96; 95% CI: 0.94-0.98). This trend remains after adjusting the population density, and higher difficulty in walking due to slopes and stairs is newly significant to knee pain (PR: 1.09; 95% CI: 1.01-1.18).

Conclusions:

Some of the neighborhood walkability has a protective relation to the knee and low back pain for older people. Longitudinal and intervention studies of the built environment for musculoskeletal pain are required.

Key messages:

- To our knowledge, this is the first study to discover that neighborhood walkability has a protective relation to knee and low back pain considering various adjustments in a large-scale survey.
- Improvement of built environments could potentially reduce musculoskeletal pain. In the future, not only individual factors but also environmental determinants of pain should be studied.

Interrupted time series analyses on the effect on integrated care among the older population

Janne Agerholm

J Agerholm[1]
[1] Aging Research Center, Karolinska Institutet, Stockholm, Sweden
Contact: japjspam@gmail.com

Background:

Current health and social care systems in most European countries, are highly fragmented into specialist services, and poorly designed to provide health and social care for patients with multiple health problems and social needs. As some groups of patients might have greater difficulties navigating in a fragmented and divided system than others, current system also risks increasing inequalities in access and use of health and social care services. The aim of this study is to investigate if a comprehensive integrated care system perform better than 'standard care' in regards to emergency department visits, hospitalization for ambulatory care sensitive conditions (ACSC), costs and re-admissions as well as increase equity in health care among older people.

Methods:

This study is an intervention study based on a comparative interrupted time series design comparing data from Norrtälje, where an integrated care system was implemented in 2006, with other areas of Stockholm county with a standard care system. The time series consists of register data from 2000-2015, obtained from the Stockholm County Council's administrative database of healthcare utilization and population data on socio-demographic characteristics from national registers.

Preliminary results

The preliminary results based on data from 2000-2011 suggest that the introduction of an integrated care system in Norrtälje did not affect the rate of hospitalization for ACSC, costs or rates of emergency department visits. When stratifying on income group we saw that the lowest income group did improve in some of the outcomes.

Conclusions:

The integrated care system in Norrtälje seems to have no significant effect on the outcome measures included. Whether socioeconomic inequity was affected is still to be investigated further.

Key messages:

- In this study we used interrupted time series to investigate organisational changes in the health care sector.
- Introducing integrated care in Norrtälje seems to have little effect on register based outcome measures.

Assessments, evolutions and transformations in French nursing homes

Tiba Delespierre

T Delespierre[1,3], PE Haÿ[1], D Armaingaud[1], L Josseran[2,3]
[1] Direction Médicale et Soins Pôle Séniors Korian, Paris, France
[2] Hôpital Raymond-Poincaré, AP-HP, Garches, France
[3] University of Paris-Saclay, Versailles, France
Contact: tiba.baroukh@gmail.com

Background:

Korian is a private group specialized in medical accommodation for elderly and dependent people. A professional data warehouse EasySoins® set up in 2010 hosted 126 nursing homes (NH) residents' data. Then in 2013, another data warehouse NetSoins® replaced the former; with a completely new information system (IS). Deployment ended in July 2014 with 151 NH but since then, the number of NH has increased steadily to reach 288 at the end of 2018. Inside both systems, the transmissions' table fed on a daily basis by the caregiver contains key data about the residents' care and health. It also allows us to build residents' life trajectories. A recent study compared the 2011 and 2015 NH populations in France. Other research papers explored similar issues in the USA, Belgium and Great Britain. The objective of this study is to show that our data extraction method offers a vivid image and faithful reflection of the French residents' population evolution over time.

Methods:

Wanting to replicate and update the French study, we built two sets of Korian residents: those having at least one transmission over the last six weeks of 2014 and 2018. We then joined these two tables with their socio-demographic profile. Finally, we searched among the residents' autonomy level evaluations (GIR = ISO resource group), the 'nearest' ones to each periods. We were then able to assess the residents' population evolution.

Results:

We found respectively 12,279 residents living in 156 NH and then 23,926 residents, living in 288 NH. In 2014, 9,174 women with a mean age of 87.5 (standard deviation = 7.4) and 3,105 men with a mean age of 84.6 (standard deviation = 9). In 2018, 3,075 were still there (25%) with 17,561 women, mean age of 88.4 (standard deviation = 7.5) and 6,365 men, mean age of 85.2 (standard deviation = 9.4). The GIR modal class stayed stable at two for both sexes at 30%.

Conclusions:

As elsewhere, men and women are growing a little older, reaching a glass ceiling, with a narrowed gender gap.

Key messages:

- As nursing home residents' profiles are rapidly changing over time and caregiver resources do not increase accordingly, allocating adequate resources to every resident becomes essential.
- The transmissions' table with its nursing care narratives textual content can help us track every resident on almost real time and, through this process, define health paths and health subgroups.

In-home monitoring evaluation by home-dwelling older adults, caregivers and healthcare providers

Valérie Santschi

B Pais[1], P Buluschek[2], T Nef[3], N Schütz[3], H Saner[3,4], D Gatica[5], V Santschi[1]

[1]La Source, School of Nursing Sciences, HES-SO University of Applied Sciences and Arts Western Switzerland, Lausanne, Switzerland

[2]DomoSafety SA, Lausanne, Switzerland

[3]ARTORG Center for Biomedical Engineering Research, University of Bern, Bern, Switzerland

[4]Department of Cardiology, University Hospital Bern, Bern, Switzerland

[5]Idiap Research Institute, Martigny, Switzerland

Contact: v.santschi@ecolelasource.ch

Background:

In Europe, population ageing is increasing the healthcare needs and costs. Both frailty and chronic diseases affecting older people reduce their ability to live independently. However, most older people prefer to age in their own homes. New development of in-home monitoring can play a role in staying independent, active and healthy. Our objective was to evaluate a new in-home monitoring system among home-dwelling older adults (OA), their family caregivers (FC), and their healthcare providers (HCP) for the support of home care.

Methods:

The system continuously monitored OA's daily activities (e.g., mobility, sleep habits, fridge visits, door events) at home by ambient sensor system (DomoCare®) and health-related events by wearable sensors (Fitbit®, ECG). In case of deviations in daily activities (e.g., changes in mobility), alerts were transmitted to HCP via email. Using specific questionnaires, the opinion of 13 OA, 13 FC, and 20 HCP were collected at the end of 12-month of follow-up focusing on their user experience and the impact of in-home monitoring on home care services.

Results:

These preliminary results underlined that the majority of OA, FC, and HCP consider that in-home sensors can help staying at home, improving home care, reducing family stress, and preventing domestic accidents. The opinion tended to be more favourable toward ambient sensors (80%) than toward Fitbit® (67%) and ECG (64%). On average, OA (80%) and FC (73%) tended to be more enthusiast than HCP (63%). Some barriers reported by HCP were a fear of weakening of the relationship with OA and an excessive surveillance.

Conclusions:

Overall, the opinion of OA, FC and HCP were positive related to in-home sensors, with HCP being more mixed about their use in clinical practice.

Key messages:

- In-home monitoring technologies seem to be generally well accepted.
- In-home monitoring technologies could be help facilitating home care of older people.

Impact of integrated care on the use of emergency care among older people in Stockholm County

Megan Doheny

M Doheny[1], J Agerholm[2], N Orsini[1], P Schön[2], B Burström[1]

[1]Public Health Sciences, Karolinska Institutet, Stockholm, Sweden

[2]Aging Research Center, Karolinska Institutet, Stockholm, Sweden

Contact: megan.doheny@ki.se

Background:

In Sweden, health care is a regional responsibility and social care of older people is a municipal responsibility. The system is fragmented and the use of emergency care by older persons is rising. Better integration, coordination, and collaboration between health and social care providers is necessary to address the complex needs of an ageing population. Since 2006, Norrtälje municipality in Stockholm Region has integrated health and social care. This study aims to assess the impact of the integrated care system in Norrtälje on rates of emergency care visits, compared to the rest of Stockholm county.

Methods:

A repeated cross-sectional study with an interrupted time series analysis compared the integrated care system in Norrtälje to a matched control from Stockholm county, using. population-based register data between 2000-2015 obtained from Stockholm Region's administrative database of healthcare utilization and from the Longitudinal Integration database for Health Insurance and labour market studies from Statistics Sweden.

Results:

There was no statistically significant difference in the post-intervention rates of emergency care visits in Norrtälje compared to the matched control. However, there was a decreasing trend in the rate of visits among females 65-79 years, those in lower income groups, those living alone and those born outside of Sweden.

Conclusions:

The implementation of the integrated care system in Norrtälje had no statistically significant impact on the rate of emergency care visits among older persons compared to standard care. However, there was a reduced rate of visits among potentially vulnerable sub-groups. Further research is needed as the full implementation of the Norrtälje Model was completed as recently as 2016 and the full impact may not yet be realised.

Key messages:

- Bringing about change in the delivery of health and social care is complex and challenging. Thus, to observe differences in the utilisation of emergency care requires more time and resources.
- Innovation in the delivery of health and social care is needed to effectively manage and coordinate the ever changing needs of older persons with complex needs given the current fragmented services.

Factors associated with uptake of abdominal aortic aneurysm screening by older men living in Scotland

Kalonde Kasengele

K Kasengele[1]*, MA Crilly*[2]*, F Nimmo*[1]
[1]Public Health, NHS Grampian, Aberdeen, UK
[2]Medical School, Institute of Applied Health Sciences, University of Aberdeen, Aberdeen, UK
Contact: kalonde.kasengele@nhs.net

Background:

High uptake is essential for abdominal aortic aneurysm screening to be effective. The aim of this study was to assess the influence of rurality, social deprivation, clinic type, distance to screening clinic and season on uptake of abdominal aortic aneurysm screening by men aged 65 years.

Methods:

Screening in Grampian was undertaken by four trained nurses in eight community and two hospital clinics. Men aged 65 years were invited for screening by post, with two further reminders for non–responders. Abdominal aortic aneurysm screening data are stored on the national 'call-recall database'. The Scottish 'postcode directory' was used to allocate all invited men a deprivation index (Scottish Index of Multiple Deprivation), Scottish urban/rural category and distance to clinic. Multivariate logistic analysis was conducted using IBM-SPSS Statistics (version 24).

Results:

A total of 12,281 men were invited for screening between 1st November 2013 to 31 January 2017. Overall uptake was 87 per cent. The detection rate was 12.0 per 1000 men screen (95 per cent c.i. 9.9 to 14.0). The prevalence of abdominal aortic aneurysms increased with increasing deprivation, whereas uptake declined with increasing levels deprivation. On multivariable analysis a one point increase in SIMD decile was independently associated with a 1.10 (95 per cent confidence interval 1.08 to 1.12) increase in the relative odds of being screened. Uptake was consistently lower in the 'large urban area' of Aberdeen city compared to the other five Scottish urban/rural categories. Uptake was lower at community-based clinics. Season and distance-to-clinic were not independently associated with uptake.

Conclusions:

Social deprivation, urban/rural residence and clinic type were found to be independently associated with the uptake of abdominal aortic aneurysm screening among men.

Key messages:

- A more targeted approach is needed in the large urban area of Aberdeen because the impact of multiple social deprivation on uptake was found to be more substantial here.
- Encouraging high uptake remains essential for abdominal aortic aneurysm screening to be effective.

Impact of a community respiratory service on emergency hospital admissions

Kate Levin

K Levin[1]*, D Anderson*[2]*, M Milligan*[3]*, E Crighton*[1]
[1]Public Health Directorate, NHS GGC, Glasgow, UK
[2]Emergency Care & Medical Services, NHS GGC, Glasgow, UK
[3]Community Respiratory Team, NHS GGC, Glasgow, UK
Contact: katyannlevin@gmail.com

Background:

A community respiratory service was implemented in the North West of Glasgow in January 2013, comprising a team of physiotherapists, occupational therapists and support workers, to provide education, self-management advice, and, where appropriate, treatment at home, for COPD patients, to reduce the risk of hospital admission. This study measures the impact of the service on emergency admission to hospital.

Methods:

COPD EAs were defined as emergency admissions to hospital with a primary diagnosis of COPD. Rate of COPD EAs per 1000 population aged 65 years+ in Glasgow City was compared before and after onset of the service, using segmented linear regression with 21-month pre- and 17-month post-intervention periods. COPD EAs for residents of South and North East Glasgow (S+NE) - areas with no such service in place - were used as a comparison group. The model adjusted for the rate of all-cause emergency admissions. Autoregressive terms were included in the model, as well as a fourier term to adjust for seasonality. Models were similarly run for outcome emergency admissions with COPD in any of the other five fields of diagnosis.

Results:

Adjusting for all cause EAs and changes in S+NE, thus factoring out the impact of other initiatives that may have affected emergency admission to hospital, the impact of the service was found to be a level change of -0.33 (-0.51, -0.16) and a trend change of -0.03 (-0.05, -0.02) COPD EAs per 1000 per month. This is equivalent to a predicted reduction due to the service of -0.88 COPD EAs per 1000 popn per month, in March 2015, and a relative reduction of 35.8%. Rate of COPD EAs per month reduced over time after the introduction of the service (from the point of full staffing). Rate of EAs with COPD in a field of diagnosis other than primary saw no significant change in level or trend associated with the service.

Conclusions:

The community respiratory service was associated with a significant reduction in the rate of COPD EAs.

Key messages:

- The Community Respiratory service was associated with reductions in emergency hospital admissions with COPD as a primary diagnosis.
- There was no significant change in emergency admissions with COPD as a secondary diagnosis, suggesting hospital attendance for patients with COPD overall reduced following the intervention.

4.M. Food, nutrition and diet

The European FOOD programme (Fighting Obesity through Offer and Demand)

Romane Leaute

R Leaute[1]*, N Bertrand*[1]
[1]Public Affairs, Edenred, Brussels, Belgium
Contact: romane.leaute@edenred.com

Designated by the WHO as one of the greatest public health challenge of our century, obesity in 2018 is still responsible for 1 in 5 deaths in different parts of Europe. A balanced diet is therefore essential for European citizens' health. Moreover, as employees spend a significant amount of their waking hours at work, it is a designated place to convey health promotion messages and improve the workers' eating behavior. The FOOD programme contributes to this objective by promoting healthy eating habits during the working day towards two complementary target groups: workers and restaurants, making the healthy choice more obvious and more accessible. The FOOD programme is a public-private consortium gathering representatives of Public Health Authorities, Nutritionists and Universities around the lead partner and coordinator Edenred in Austria, Belgium, Czech Republic, France, Spain, Italy, Portugal, Romania, and Slovakia. To meet its objectives, the Consortium followed a five-step methodology with a strong evaluation, enabling a qualitative and adapted set of actions. After a phase of analysis of the needs, communication tools were created to provide practical advice and recommendations to encourage healthy eating habits among the workers and restaurants.

Since 2009, 380 communication tools have reached 6,9 million employees and 521,000 restaurants. In addition, as part of the annual evaluation, barometers are being conducted towards employees and restaurants in order to collect their habits and perception of healthy eating during the working day. Since 2012, 82,600 workers and 7,700 restaurants answered the questionnaires. Return from the target groups confirms a change of perception in the last years as almost half of employees choose a restaurant based on healthy options. On their side, restaurants state a regular increase in the demand for healthy meals and reckon that they could learn more about healthy eating.

Key messages:

- Creating healthier eating patterns during the working day.
- Making the healthy choice the easy choice.

Eating habits trajectories of students using university canteens

Valentina Lorenzoni

V Lorenzoni[1], I Triulzi[1], L Toncelli[2], I Martinucci[3], N De Bortoli[4], M Natilli[5], A Monreale[5], D Pedreschi[5], R Barale[6], G Turchetti[1]
[1]Institute of Management, Scuola Superiore Sant'Anna, Pisa, Italy
[2]Area Ristorazione, Azienda Regionale per il Diritto allo Studio Universitario, Pisa, Italy
[3]Division of Gastroenterology, Versilia Hospital, Lucca, Italy
[4]Division of Gastroenterology, University of Pisa, Pisa, Italy
[5]Department of Computer Science, University of Pisa, Pisa, Italy
[6]Department of Biology, University of Pisa, Pisa, Italy
Contact: v.lorenzoni@sssup.it

Background:

Diets among the young often do not meet recommendations thus increasing the risk of developing chronic condition in adulthood. The present study aims at evaluate dynamics of eating habits among university students using data automatically recorded by cashier transactions at canteen.

Methods:

The study population consisted of 8,338 students enrolled in bachelor courses at Pisa University in 2010-2014 and accessing canteens at least once all over their courses duration (three year). Analyses were performed merging the administrative archive of the University of Pisa and the database of cashier transactions at university canteens. The frequency of different food-groups choice over years was evaluated using a zero- and one-inflated beta regression models, while latent class analysis (LCA) and posterior probabilities derived from that were used to evaluate the evolution of eating habits.

Results:

In adjusted models, the proportion of fruit choices increased significantly in both the second ($\beta = 0.077[0.013]$) and third year of registration ($\beta = 0.233[0.018]$), similarly for vegetables ($\beta = 0.090[0.011]$ and $\beta = 0.065[0.015]$). Conversely, the selection of foods commonly labelled as unhealthy decreased over registration years. LCA revealed 4 different classes each year. The 4 classes distinguished ''healthy eaters'' (LC1), those often choosing sweets, potatoes and legumes (LC2 ''lazy eaters''), ''greedy and quick eaters'' (LC3) favoring the selection of fried foods, sandwiches and sweets while LC4 represented ''selective eaters'' composing their meals combining mainly grains and vegetables. The probability of being a ''lazy'' or ''greedy and quick'' eaters declined significantly overs registration years. ''Selective eaters'' almost doubled over years while the probability of belonging to the ''healthy'' class showed a weak increase over years.

Conclusions:

During the years following enrollment students tended to limit choices towards unhealthy foods in favors of healthier dishes.

Key messages:

- Intervention for the promotion of healthy eating among young adults is essential as awareness of choices may raised only in adulthood.
- The present work outline the use of digital traces for public health research.

Energy drink consumption pattern among university students in North East England

Shelina Visram

S Visram[1,2], V Ananthakkarasu[1]
[1]Faculty of Medical Sciences, Newcastle University, Newcastle-upon-Tyne, UK
[2]Fuse (Centre for Translational Research in Public Health), Newcastle University, Newcastle-upon-Tyne, UK
Contact: shelina.visram@newcastle.ac.uk

Background:

Energy drinks (EDs) are popular beverages with young people, particularly in the UK. There is an emerging evidence base on the negative health impacts in children and adolescents, largely relating to the high caffeine and sugar contents of these drinks. However, no studies have been conducted to date focusing on university students in the UK. The purpose of this study was to investigate factors underpinning ED consumption, as well as health effects reported by students.

Methods:

An online survey was conducted with a non-representative sample of 900 students from the five universities in the North East of England. This included questions on ED consumption, perceived stress (10-item PSS), general health status, personal wellbeing (ONS4), lifestyle and use of other substances such as alcohol. Responses were analysed using SPSS.

Results:

84% of respondents ($n = 756$) had consumed EDs at least once, mainly while partying or during revision. Of these ED consumers, 542 (71.7%) reported experiencing symptoms following intake, with the most common being elevation of heart rate and palpitations. No associations were found between ED consumption and perceived stress or wellbeing, but an inverse U-shaped association was observed with self-reported health (i.e. lowest consumption among those who rated their health as either ''very good'' or ''bad''). Consumers were more likely to be male, White, from the UK, less affluent backgrounds, and report having no religion. Co-consumption with alcohol was common in the cohort (46.2%). Those who used substances such as cigarettes, e-cigarettes and cannabis were also more likely to be ED consumers.

Conclusions:

ED consumption is highly prevalent in the student population, linked to socioeconomic and cultural factors rather than perceived stress or wellbeing. Prevention campaigns targeting students should aim to raise awareness of the consequences of chronic and acute ED consumption, particularly in conjunction with other substances.

Key messages:

- ED consumption is highly prevalent in the student population, often in conjunction with alcohol.
- Consumption is linked to socioeconomic and cultural factors rather than perceived stress or personal wellbeing.

Health impact of substituting red meat by fish: addressing variability in risk-benefit assessments

Sofie Theresa Thomsen

ST Thomsen[1], W de Boer[2], SM Pires[1], B Devleesschauwer[3], S Fagt[4], R Andersen[1], M Poulsen[1], H van der Voet[2]
[1]Division of Diet, Disease Prevention and Toxicology, National Food Institute, Technical University of Denmark, Kgs. Lyngby, Denmark
[2]Biometris, Wageningen University and Research, Wageningen, Netherlands
[3]Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium
[4]Division of Risk Assessment and Nutrition, National Food Institute, Technical University of Denmark, Kgs. Lyngby, Denmark
Contact: sthth@food.dtu.dk

Background:

Sufficient intake of fish and limited red meat intake is commonly encouraged by national dietary guidelines to prevent various lifestyle diseases. One way to fulfill these guidelines would be to substitute red meat by fish. However, quantitative evidence of the public health gain of such substitution is lacking. Moreover, contaminants in these foods may compromise nutritional benefits. We aimed to estimate the health impact of substituting red meat by fish in the Danish diet in a risk-benefit assessment (RBA). Our study can support policy makers in defining evidence-based public health strategies.

Methods:

We quantified the health impact of substituting red meat by fish among Danish adults in terms of Disability-Adjusted Life Years (DALY) using data from a national dietary survey and food monitoring. We investigated the use of probabilistic methods to model variability in individual substitution behaviors and to assess health impact distributions in RBA of food.

Results:

Health impact of the substitution varied largely by the type of fish consumed and by age and sex of the consumer. We estimated that 134 (95% uncertainty interval: 102; 169) DALYs/100,000 could be averted per year if a mix of lean and fatty fish is consumed in the Danish recommended amounts and intake of red meat decreased among Danish adults. The highest benefit was estimated for women in the childbearing age and for men above 50 years of age. However, a small fraction of women were assigned an overall health loss due to methylmercury exposure during pregnancy and the associated adverse effects in unborn children.

Conclusions:

Our study estimated an overall health gain of substituting red meat by fish in the general Danish adult population, while providing insight in the variability in health impact at the level of individual consumers. Our approach can be applied in other RBAs and the results support the need for targeted public health strategies to ensure consumer health and safety.

Key messages:

- The health impact of substituting red meat by fish in Danish adults was quantified in terms of disability-adjusted life years (DALYs), while accounting for variability between individuals.
- We estimated that young women and men above 50 years of age will experience the largest health gain while a small fraction of the women were assigned a health loss due to chemical exposure.

Macro- and micro-nutrient intake among Hungarian general and Roma adults

Erand Llanaj

E Llanaj[1], *F Vincze*[1], *Z Kósa*[2], *R Ádány*[1,3,4]
[1]Department of Preventive Medicine, University of Debrecen, Debrecen, Hungary
[2]Department of Methodology for Health Visitors & Public Health, University of Debrecen, Debrecen, Hungary
[3]MTA-DE-Public Health Research Group, University of Debrecen, Debrecen, Hungary
[4]WHO Collaborating Centre on Vulnerability and Health, University of Debrecen, Debrecen, Hungary
Contact: erand.llanaj@sph.unideb.hu

Background:

Few studies have been conducted with reference to dietary intake among adults in Hungary and none among Roma. In this study, we assess dietary intake of both Hungarian general (HG) and Hungarian Roma (HR) adult population and provide an up-to-date preview on highly health-relevant macro- and micro-nutrient intakes and dietary profile of the HG and HR adult population.

Methods:

The study population comprised 797 Hungarian adults (HG: N = 410, response rate = 82% and HR: N = 387, response rate = 79%), representative in terms of geographic, sex and age distribution with the general population aged 20-64 years, from the 2018 GINOP Complex Health Survey. Energy and selected nutrient intakes were calculated with NutriComp v.3.0, based on a qualitatively validated double 24 hours dietary recall, adopted for the Hungarian population.

Results:

Total daily energy and selected nutrients intake among HG and HR adult subjects are reported. In spite of the presence of diluted underestimation effects, intake of nutrients with high relevance to health (i.e. sugars, sodium, saturated fats, cholesterol, etc.) remains relatively high, while consumption of fibre-rich products and beneficial nutrients appear to be low, particularly among Roma. Considering both health and environmental impact of the diet, animal-based proteins are way over the target value (i.e. 6%E) of the recent EAT-Lancet report.

Conclusions:

Findings provide data on dietary patterns of HG and HR with nutrient-level estimations, highlighting the importance of establishing and integrating Roma nutrition in national surveillance and monitoring systems for key dietary risk factors. Public health strategies to modify current dietary patterns in Hungary are a great opportunity for improving nutrition, health and environmental impact of dietary choices, especially within the current framework of the UN Decade of Action on Nutrition (2016-2025).

Key messages:

- Our study highlights the importance of establishing and integrating Roma nutrition in national surveillance and monitoring systems for key dietary risk factors.
- Current findings warrant further investigations of the nutritional and dietary patterns among Hungarian General and Roma adult population and their impact on health and environment.

Taste and food preferences of the Hungarian Roma population

Judit Diószegi

J Diószegi[1], *P Pikó*[1], *Z Kósa*[2], *J Sándor*[3], *R Ádány*[1,3,4]
[1]MTA-DE Public Health Research Group, University of Debrecen, Debrecen, Hungary
[2]Department of Methodology for Health Visitors and Public Hea, Faculty of Health, University of Debrecen, Nyíregyháza, Hungary
[3]Department of Preventive Medicine, Faculty of Public Health, University of Debrecen, Debrecen, Hungary
[4]WHO Collaborating Centre on Vulnerability and Health, Faculty of Public Health, University of Debrecen, Debrecen, Hungary
Contact: dioszegi.judit@sph.unideb.hu

Background:

Behind the unfavorable health status of the Roma population, harmful health behavior is also supposed to exist, such as unhealthy nutrition.

Methods:

In the framework of a complex comparative health survey individuals, representative of the Hungarian general (n = 410) and Roma populations (n = 387) were randomly enrolled. In the questionnaire-based part of the survey, sweet, fat, salty and bitter taste preferences were ascertained by question items measuring taste and food preferences. Preference for sweet versus salty foods was also analyzed. Questions from the Hungarian version of the European Health Interview Survey were included, to characterize fruit and vegetable consumption and to determine the quantity of added sugar to consumed foods and beverages and the frequency of salting without tasting the food. The data were analyzed using STATA 9.0 statistical software.

Results:

Roma reported significantly less frequent consumption of fresh fruits (OR = 1.84, 95% CI: 1.43-2.37, $p < 0.001$) and vegetables (OR = 1.64, 95% CI: 1.27-2.11, $p < 0.001$) than the Hungarian subjects. Roma had higher preferences for sweet (OR = 1.57, 95% CI: 1.21-2.04, $p < 0.001$) and salty foods (OR = 1.33, 95% CI: 1.03-1.71, p = 0.029) and added higher quantities of sugar to consumed foods and beverages (OR = 1.88, 95% CI: 1.38-2.57, $p < 0.001$) and salted the food without tasting more often (OR = 2.18, 95% CI: 1.64-2.88, $p < 0.001$). They could be characterized by lower preferences for bitter tasting kohlrabi (OR = 0.64, 95% CI: 0.49-0.82, p = 0.001), grapefruit

(OR = 0.47, 95% CI: 0.36-0.60, $p < 0.001$), black coffee (OR = 0.48, 95% CI: 0.36-0.64, $p < 0.001$) and bitter chocolate (OR = 0.56, 95% CI: 0.44-0.72, $p < 0.001$) and preferred sweet snacks versus salty ones (OR = 0.56 for salty snacks, 95% CI: 0.42-0.74, $p < 0.001$).

Conclusions:

The Hungarian Roma diet may be linked to taste preferences predisposing to unhealthy nutrition. This assumption needs further studies on their nutritional behavior.

Key messages:

- Hungarian Roma taste preferences may predispose to unhealthy nutrition.
- Understanding the determinants of food choices is essential to the development of public health strategies targeting the Roma.

A multicentre study of street foods purchased in urban areas of Central Asia: the FEEDCities Project

Sofia Sousa

S Sousa[1,2], N Lunet[1,3], M Gelormini[4], J Jewell[4], I Morais[4], G Albuquerque[1], S Casal[1,5], O Pinho[2,5], J Breda[4], P Padrão[1,2]

[2]Faculdade de Ciências da Nutrição e Alimentação, Universidade do Porto, Porto, Portugal

[3]Faculdade de Medicina, Universidade do Porto, Porto, Portugal

[4]WHO EURO, Copenhagen, Denmark

[5]REQUIMTE, Faculdade de Farmácia, Universidade do Porto, Porto, Portugal

Contact: sofiaazevedodesousa@gmail.com

Background:

Street food (SF) is a strong tradition in Central Asia, where urbanization and westernization of food habits is occurring. Research on SF consumption is scarce, and crucial to understand its implications for public health. This study aims to describe the SF purchases in urban areas of Tajikistan, Kyrgyzstan, Turkmenistan and Kazakhstan.

Methods:

A cross-sectional study was conducted in Dushanbe, Bishkek, Ashgabat and Almaty in 2016/2017. SF markets (n = 34) and vending sites (n = 270) were selected by random and systematic sampling. Data on customers' characteristics and food items purchased was collected by direct observation. Nutritional composition of the food items (n = 852) was obtained by laboratorial analysis (n = 582) or food composition tables and labels (n = 270).

Results:

A total of 714 customers were identified. The most commonly purchased foods and beverages were savoury pastries/snacks (23.2%), main dishes (19.0%), sweet pastries/confectionery (17.9%), tea/coffee (11.3%) and soft drinks/juices (9.8%). Fruit was the least frequently purchased food (1.1%). Nearly one-third of customers purchased industrial food items; this proportion was significantly higher in Kazakhstan (43.2%) and Turkmenistan (32.3%). The median energy content of a SF purchase ranged between 352kcal (Tajikistan) and 568kcal (Turkmenistan). The median saturated (SFA) and trans fat contents were 4.74g and 0.36g, respectively; the highest values were 9.01g for SFA (Turkmenistan) and 0.60g for trans fat (Kazakhstan), accounting for 40.6% and 27.3% of the maximum daily recommendations, respectively. Sodium-potassium ratio was far above recommended, reaching the highest values of 6.57 and 5.17 in Tajikistan and Kyrgyzstan.

Conclusions:

Frequent purchase of industrial food reflects a shift to a westernized dietary pattern. Public health policies in these settings should aim to increase fruit availability and to improve SF nutritional composition, namely its lipid profile and sodium content.

Key messages:

- A relevant proportion of customers bought industrial foods, while fruit was rarely purchased, reflecting the nutrition transition process that is occurring in developing countries.
- Street food meals showed concerning levels of saturated fat, trans-fat and sodium, which must be considered when designing strategies targeted to improve the urban food environment in these settings.

Could chips and nuts be vector of food-borne outbreaks during happy hour?

Francesco Gori

F Gori[1], C Cuccaro[1], M Santamaria[2], R Cardaci[3], S Burgassi[3], M A Battaglia[4], G Messina[1,3]

[1]Department of Molecular and Developmental Medicine, Post-graduate School of Public Health, University of Siena, Siena, Italy

[2]University of Siena, Siena, Italy

[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy

[4]Life Science Department, University of Siena, Siena, Italy

Contact: francescogori24@gmail.com

Background:

A Greater tendency to eat meals outside the home has led to an increase in the attendance of restaurants, cafes, and fast food. That is one of the reasons why the global interest in handling food has risen over the years. The aim of this study is to understand the level of microbial contamination in the food that is served along happy hour in cafe.

Methods:

This cross sectional pilot study was performed from April to May 2018 in the city of Siena, central Italy (<60000 citizens). Ten cafes were randomly selected. Samples of peanuts and potatoes were obtained in three different moments, at the beginning (T0), in the middle (T1), at the end (T2) of happy hours events. Collection of the samples was obtained using sterile kit and laboratory analysis was conducted in the University lab. The samples were located on selective medium and the growth of microbial pathogens were checked at 24 and 48 hours. The tested microorganisms were Enterococci, Staphylococci, Coliforms bacteria, Molds, and Yeasts. The statistical analyses were conducted using the Wilcoxon test using Stata 12.

Results:

A significant Yeasts contamination appeared only on chips at T0, while within T0 and T1 we found a significant increase of Enterococci, Staphylococci, and Yeasts ($p < 0.05$) both in peanuts and chips. Comparing T1 and T2 only Yeasts showed significant growth in potatoes ($p = 0.04$). Between T0 and T2 we also found the growth of Coliforms bacteria in peanuts ($p = 0.03$).

Conclusions:

We showed an increase in the microbial load associated with food handling, mostly of Enterococci. Long exposure time increased the likelihood of contamination and the possibility to exceed the dose for the occurrence of good outbreak. It is likely that offering small portions of handling food would reduce the manipulation by participants and the risk of food-borne outbreaks.

Key messages:

- Define the most frequent microrganisms could be associated with backed food and evaluate which one of these can exceed the dose for the occurrence of disease in long time.
- Reflect on the likelihood that the risk of food-borne outbreak caused by manipulation of happy hour participants, may result in an increase in hospital admissions.

4.N. Workshop: Health workforce coordination and agency across sectors, organisations and professions

Organised by: EUPHA (HWR), EUPHA (HSR)
Chair persons: Ellen Kuhlmann - EUPHA (HWR), Viola Burau - Denmark
Contact: kuhlmann.ellen@mh-hannover.de

Background:

An increase in chronic illness and multimorbidity together with 'ageing societies' and demand for long-term care have created growing need for integrated care and improved coordination of services. However, health systems largely failed to respond to changing needs. Education and training of health professionals are still organised 'in silos'; connections between health and social care and other groups providing relevant services are usually absent; and fragmentation of care according to specialisation remains the dominant organising principle of healthcare services. In this situation there is an urgent need for change to build skills and competencies, use health human resources more effectively and rearrange care according to population needs and preventative approaches.

Objectives:

This workshop brings together research from different national and European research projects positioned at the interface of healthcare services and workforce development. The major aim is to foster the building of bridges across professions, organisations and sectors. The workshop seeks to explore the benefits and novel insights gained from comprehensive efforts to strengthen coordination and integrated models of care and how this may foster agency of the health professions as well as the implementation of new models of care that strengthen health promotion. The findings illustrate that capacity for innovating health systems can be improved through coordination and the crucial role of health professions in these transformations. Health professionals may act as facilitators of integrated work and care arrangements. Strengthening professional agency and coordination across sectors, organisations and professional groups embodies new opportunities for innovating health service provision and health workforce development. These transformations, in turn, may foster people-centred healthcare services.

Key messages:

- Building bridges between sectors, organisations and professions is a key to people-centred care.
- Coordination improves health workforce agency and service capacity to respond to population needs.

An international perspective on organisational strategies to foster skill-mix changes in healthcare

Marieke Kroezen

M Kroezen[1], G Dussault[2], C Gericke[3], E Kuhlmann[4,5]
[1] Academic Collaborative Center Living with an Intellectual Disability, Tranzo, Tilburg University, Netherlands
[2]Institute of Hygiene and Tropical Medicine, Universidade Nova de Lisboa, Lisbon, Portugal
[3]School of Clinical Medicine, The University of Queensland, Queensland, Australia
[4]Institute of Epidemiology, Social Medicine and Health Systems Research, Medical School Hannover, Hannover, Germany
[5]Department of Public Health, Aarhus University, Aarhus, Denmark
Contact: m.kroezen@uvt.nl

Background:

The implementation of skill-mix innovations in healthcare organisations is a complex process which many factors affect, positively or negatively. Facilitators are factors which stimulate or expand skill-mix change, whereas barriers are factors that limit or restrict skill-mix change. This study provides an overview of the most common facilitators and barriers.

Methods:

An overview of systematic reviews was conducted as part of a larger project studying skill-mix innovations. 20 reviews on organisational-level factors related to the implementation of skill-mix innovations were included. The evidence from the reviews was supplemented with country case studies.

Results:

Organisational factors, such as physical proximity of services involved in the skill-mix or well-functioning information systems, are often discussed in the literature on skill-mix implementation at organisational level. The same applies to individual factors, such as required knowledge levels or (lack of) trust. Process factors and characteristics of the skill-mix intervention seem to play a less important role, even though coaching and support for professionals seem to facilitate the implementation process. The institutional environment mainly seems to have a hampering effect, especially related to a lack of financing, reimbursement issues or perceived fears of liability. Often, the implementation of skill-mix interventions at organisational level is approached by focusing on specific facilitators and barriers, yet little attention is paid to structural approaches.

Conclusions:

There is no single appropriate strategy for implementing skill-innovations that will fit all organisations. Managers must adopt an optimal strategy when implementing skill-mix, usually involving a combination of approaches best suited to local factors, to their specific organisational context and to the individuals involved.

Intersectoral coordination and diabetes prevention: building capacity through professional agency

Viola Burau

V Burau[1,2], L Hillersdal[3], A Timm[3], HT Maindal[1,3]
[1]Department of Public Health, Aarhus University, Aarhus, Denmark
[2]Department of Political Science, Aarhus University, Aarhus, Denmark
[3]Steno Diabetes Center, Copenhagen, Denmark
Contact: viola@ph.au.dk

Background:

Intersectoral coordination of disease prevention is highly complex. The case of women who develop diabetes during pregnancy (GDM) is a case in point: intersectoral coordination mainly concerns diabetes prevention and thus stretches over the life course of women and their families. Our study aims to analyse how health professions through their day-to-day practice contribute to the creation, maintenance and transformation of intersectoral coordination of diabetes prevention over the life course; and how contexts at systems/organisational influences such processes.

Methods:

The study draws on organisational studies of professions and focuses on the mechanisms underlying the making of intersectoral coordination. As part of a pilot study, we conducted a review of the international literature on intersectoral coordination of public health, a review of national policy documents, and a secondary analysis of interviews conducted as part of the development of the Face-it intervention.

Results:

The organisation of GDM diabetes prevention in Denmark emerges as fragmented. Care pathways are divided between different phases, types of services, sectors and health professions. There are additional variations among municipalities. Formal (intersectoral) coordination is also limited to vulnerable women and their families. GDM diabetes prevention involves a broad range of professions; professional agency in GDM diabetes prevention is dispersed. Clinical specialists in hospitals show the strongest interest, rooted in healthcare knowledge on prevention. General practitioners have a similar knowledge base, but consider prevention less central. The same applies to health visitors and midwives, whose knowledge base also includes social care.

Conclusions:

Individual professions have a strong capacity for intersectoral agency. Strengthening this capacity requires alignment across professions and adaptation to specific contexts.

Intersectoral coordination and multiprofessional teams: merging primary care and social services

Timo Sinervo

T Sinervo[1], I Keskimäki[1,2], V Niiranen[3], S Laulainen[3], L Hietapakka[1]
[1]Department of Health and Social Care Systems, National Institute for Health and Welfare, Helsinki, Finland
[2]Faculty of Social Sciences, University of Tampere, Tampere, Finland
[3]Department of Health and Social Management, University of Eastern Finland, Kuopio Campus, Finland
Contact: timo.sinervo@thl.fi

Background:

Since the 2000s, integrated care has been a policy aim in Finland. Reforms for creating larger care authorities have failed at national level, but municipalities have established regional joint health and social integrated care authorities. Our study focuses on integration of services for children and young people and adults' psychosocial care. The aim is to evaluate integration in terms of success and its underpinning factors in two authorities with merged primary and specialised healthcare and social services.

Methods:

South Karelia and North Karelia were selected as case studies, because these regions were pioneers in establishing integrated care authorities in 2010 and 2017. Document analysis and individual and group interviews with managers (32) and employees (22) were carried out; the analysis draws on Auschra's classification of barriers and facilitators of integration.

Results:

The regions (pop. 130.000-169.000) comprise a larger town, a specialised hospital and several rural municipalities. The integration of children's and young people's services is based on organisational changes, in which the services from primary healthcare, hospitals, social work and schools (pupils' and students' healthcare) were merged into one organisation. The health and well-being centres were created by bringing mental health, substance abuse services and social services into health centre facilities, but under their own managers. In both cases, the experiences are mostly positive but the success of implementation varies; commitment and cooperation between managers, shared goals and mutual understanding of each other's work as well as the planning process were crucial factors to support implementation.

Conclusions:

Comprehensive organisations with unified management foster integration. The implementation of multiprofessional work is facilitated by organisational culture and collaboration between managers.

Interprofessional collaboration in health promotion: changing tasks as leverage for innovation

Loni Ledderer

L Ledderer[1], M Christensen[1], V Burau[1,2]
[1]Department of Public Health, Aarhus University, Aarhus, Denmark
[2]Department of Political Science, Aarhus University, Aarhus, Germany
Contact: loni.ledderer@ph.au.dk

Background:

Increasing demand for interprofessional collaboration calls for change in organisational practice and interactions of professionals. Health promotion is a particularly interesting area for observing these changes, because it involves professionals with different disciplinary backgrounds usually also working in different sectors. In Denmark new health promotion strategies in organisations were introduced to engage professionals in new tasks and establish interprofessional ways of working. Our research aimed to explore how these strategies impact in professional practices, using a cookery project for children as a case study, which involved care assistants and school teachers.

Methods:

A qualitative case study was conducted to investigate how care assistants from a nursing home and school teachers implemented a cookery project in a Danish school; the focus was on joint care and teaching situations among the two professions and their users. Our data consisted of documents, participatory observations, and interviews with professionals; a sociological institutional framework was applied to analyse the data.

Results:

Institutional changes and the demand for joint care and teaching activities in the cooking project fostered new interprofessional collaboration. Three themes of new professional activities emerged: 1) 'interplay' related to making different generations collaborate on the tasks involved in the cookery session, 2) 'care' concerned with caregiving activities, and 3) 'learning'' focused on schooling on healthy food and cooking. The activities were related to traditional and new roles in professional practices of both groups.

Conclusions:

Changes in professional practices evolved in an informal manner from new tasks and 'lived' experiences in the cookery project. The specific practical tasks of health promotion offer an important leverage for future interprofessional collaborations.

4.O. Healthy places

Community infrastructure to boost social relations: a systematic review

Anne-Marie Bagnall

A Bagnall[1], J South[1], K Southby[1], S Di Martino[1], G Pilkington[2], B Mitchell[3], A Pennington[4], R Corcoran[4]
[1]Centre for Health Promotion Research, Leeds Beckett University, Leeds, UK
[2]Edge Hill University, Liverpool, UK
[3]The Business School, Leeds Beckett University, Leeds, UK
[4]Institute of Psychology Health and Society, Heseltine Inst, University of Liverpool, Liverpool, UK
Contact: a.bagnall@leedsbeckett.ac.uk

Background:

'Boosting social relations' in communities has been identified as a priority UK policy-related topic. An earlier scoping review identified evidence gaps in social relations & community infrastructure. We undertook a mixed method systematic review on this topic, which has potential for immediate practical impact.

Methods:

A comprehensive search included 11 databases (1997-2017), grey literature and citation checking. Studies of interventions to improve or make alternative use of community or neighbourhood places, reporting outcomes of social relations, community wellbeing & related concepts were included. Established validity checklists. Qualitative data was synthesised thematically and a narrative synthesis was produced. GRADE and CERQual approaches were used to rate the overall strength of evidence for each outcome.

Results:

51 included studies, mostly of poor to moderate quality, and mostly qualitative, provided moderate evidence that:

Community hubs may promote social cohesion, increase social capital and build trust, widen social networks, increase interaction, and increase knowledge or skills;

Changes to neighbourhood design may positively affect sense of belonging and pride in a community;

Green and blue space interventions that provide the opportunity to participate in activities or meetings may improve social interactions, increase social networks, bonding and bridging social capital, physical activity and healthy eating, and improve people's skills and knowledge.

There were also common themes relating to facilitators and barriers to successful interventions.

Conclusions:

There is moderate evidence that a range of intervention approaches to community infrastructure can boost social relations and community wellbeing. Future research should prioritise high quality evaluations using repeated measures and validated tools, and robust and credible qualitative evidence.

Key messages:

- There is moderate evidence that a range of intervention approaches to community infrastructure can boost social relations and community wellbeing.
- Community hubs may promote social cohesion, increase social capital and build trust, widen social networks, increase interaction, and increase knowledge or skills.

Do perspectives on healthy environment differ between health/social professionals and urban planners?

Kristine Mourits

K Mourits[1], K Van der Velden[1], G Molleman[1]
[1]Department of Primary Health Care, Radboud Institute for Hea, Radboudumc, Nijmegen, Netherlands
Contact: Kristine.mourits@radboudumc.nl

Background:

In a multidisciplinary collaboration it is essential that professionals understand from each other what is meant by a healthy environment and of what aspects it consists. However, the field of health and social welfare and the field of urban planning differ in many aspects, including language. Therefore, this study examined: what is the perception of professionals in the field of health and social welfare and in the field of urban planning about a healthy living environment? And do these perceptions differ?

Methods:

Using the concept mapping method, 94 professionals (government and non government) in the city of Nijmegen(NL) were asked to generate statements on healthy living environment. Next, the professionals sorted these statements and rated them on priority and opportunity within urban planning processes.

Results:

In the brainstorm 45 professionals generated 136 statements. After clearing doubles, 92 statements were sorted by 32 professionals. Which, after analysis, resulted in a map of ten different clusters together indicating what professionals perceive as aspects of a healthy living environment.

There was agreement on priority and opportunity between both groups of professionals regards clusters urban quality and invited to move. The two groups professionals have different views about five clusters. Professionals of both fields agree on the three clusters with the least priority and possibilities. Interesting is the relatively limited possibilities that professionals see to stimulate healthy behavior and to improve social connectivity in urban planning.

Conclusions:

There is a consistency between professionals in the field of health and social welfare and in the field of urban planning about the most and least important aspects of healthy environment in urban planning process. It is interesting to see that, although there is a lot of agreement, there are also relevant nuances between both groups on priority and possibilities at 5 out of 10 clusters.

Key messages:

- There is a consistency about the most and least important aspects of healthy environment in urban planning process.
- It depends on the aspect of a healthy living environment if understanding and collaboration between professionals easy is.

Building bridges: Sustainable Urban Health in Hamburg, 2018

Rainer Fehr

R Fehr[1], A Trojan[2], C Hornberg[1]
[1]Fakultät Gesundheitswissenschaften, Bielefeld University, Bielefeld, Germany
[2]Medizinische Soziologie, Hamburg University, Hamburg, Germany
Contact: rainer.fehr@uni-bielefeld.de

Issue:

With most humans, globally, now living in cities, "Urban Health" receives increasing attention. For sustainably securing and promoting human health in the urban setting, a multitude of urban systems, fierce dynamics, and systemic interactions need to be considered. The goal is to provide an integrative view of Sustainable Urban Health (SUH), i.e. capturing the "forest" instead of merely the "trees". How is this possible, and what insights can be derived? A theory-based SUH approach, starting out from the Human ecology perspective, provides a framework which is compatible with WHO's Healthy Cities approach.

Methods:

Methods used include literature searches and managed cooperation, proceeding from a model exercise (published paper) to a full-scale book publication, thus building bridges across disciplines and societal sectors.

Results:

As for results, there is a comprehensive account of Hamburg SUH, including history, health status, governance, health care, rehabilitation, prevention and health promotion, "health in all policies" (e.g. economics, housing, mobility), and current integrative community projects. 100 authors delivered c.70 contributions. Activities around "health" are shown to constitute a remarkable element of urban culture, with room for improvement, e.g. concerning quality assurance on a systems level; more focus on sustainability (incl. environmental impact and overall future-proofing); and safeguarding relevant sources as a "collective memory". To take the issue forward in civic society, one venerable Hamburg NGO (founded in 1765) now established a SUH working group.

Conclusions:

The intensity and diversity as well as certain catch-up needs of SUH in a European metropolis are demonstrated. This "no regrets" approach meets with interest also in civic society. Once it is applied in multiple cities, innovative concepts and efforts can be compared easily, and get locally adjusted, for further strengthening SUH.

Key messages:

- Sustainable Urban Health (SUH), based on Human ecology, is an integrative "no regrets" approach and can cooperatively be applied anywhere, informing and guiding professionals and civic society.
- Even where activities around "health" constitute a remarkable element of urban culture, there is room for improvement, e.g. quality assurance on systems level, and more focus on sustainability.

Who, why, when and how do people use urban green spaces? A study of users from 18 parks in France

Marion Porcherie

M Porcherie[1], E Faure[4], A Roué le Gall[2], Z Vaillant[4], MF Thomas[3], S Rican[4], Z Héritage[5], C Bader[5], J Simos[6], N Cantorregi[6]

[5]WHO French Healthy Cities Network, Rennes, France
[6]Institut de Santé Globale, Université de Genève, Genève, France
Contact: marion.porcherie@ehesp.fr

Introduction:

Urban green spaces impact the individual and collective health of populations. At the city level, they act as regulators of environmental hazards and constitute collective protective factors. At the individual level, they constitute social spaces for encounters and rejuvenation. But, these functions depend on the use made of these green spaces which can be inequitable. This paper presents the results of the analysis of the use of green spaces in the 6 French cities selected in the WHO French Healthy City Network conducted as part of the GREENH-City research project.

Methods:

Based on park profiles, a qualitative survey was conducted among users of 3 different parks in each of the 6 selected cities with both observations and semi-directive interviews. Thematic analyzes were performed. Observed activities were classified into 8 groups (supervised educational, food, activities i.e. calm, commercial, artistic and cultural, physical non-sport, sports) and related to a specific use (professional/ personal, individual/ collective, authorized/ not and conflictual/ not). The uses described by the individuals interviewed were classified into 4 categories: attendance, utility, opinions and activities.

Results:

186 observations and 591 recorded and unrecorded interviews with individuals or groups were conducted in the 18 parks. Overall, calm activities are dominant. However, activities and uses differ between cities and within the city depending on the nature of the parks (ancient, new..), their management, their location (more or less central, located in a deprived area or not) and people expectations.

Conclusions:

Park uses are only partially dependent on amenities within the park. The nature of the park itself, its geographical location and its landscape characteristics seem to be decisive for the uses observed. These data are essential to inform public decision-makers and guide the creation and development of green spaces in cities in a vision of social justice.

Key messages:

- Urban green spaces can improve population health but their uses may be inequitable.
- Study of population use of urban green spaces may help to shape local policies towards more equity.

School environment and obesity in primary schools. An analysis of the WHO European COSI in Austria

Anna Lena Aufschnaiter

A Aufschnaiter[1], K Schindler[2], B Fuchs-Neuhold[1], K Maruszczak[3], E Pail[1], I Sulz[4], D Weghuber[5]
[1]Institute of Dietetics and Nutrition, FH JOANNEUM, Graz, Austria
[2]Federal Ministry of Labour, Social Affairs, Health and Consumer Protection, Vienna, Austria
[3]Obesity Academy Austria, Salzburg, Austria
[4]Institute for Medical Statistics, Medical University of Vienna, Vienna, Austria
[5]Department of Pediatrics, Paracelsus Medical University, Salzburg, Austria
Contact: anna.aufschnaiter@fh-joanneum.at

Background:

Overweight and obesity in childhood and the associated secondary diseases are constantly on the increase. Studies show that the school environment can have an influence on the weight of children. The Childhood Obesity Surveillance Initiative (COSI) of the WHO is a Europe-wide epidemiological monitoring of anthropometric sizes of school children aged six to nine, with Austria participating in COSI for the first time in 2016.

Methods:

A retrospective secondary data analysis based on two standardized questionnaires was performed. On the one hand, data on determinants specific to the school field were collected, on the other hand anthropometric data of children in third grade were measured. Across Austria, data from 97 schools and 2530 children were collected and evaluated using descriptive and inductive statistical methods.

Results:

In 43,3 % of the schools, an existing playground can be used outside school opening hours. 73,2 % of the schools integrate nutrition education into their school curriculum either as a separate subject or in combination with another subject. Milk and dairy products are available in 60,8 % of schools, fresh fruit in 63,9 % and vegetables in 51,5 %.

28,3 % of the examined, 8 to 9-year-old children are overweight or obese ($n = 658$), while boys have a significant higher BMI than girls ($p < 0,001$). Also, in urban areas children have a significant higher BMI on average than in rural areas ($p = 0,025$). No significant relationship could be identified between the duration of physical education lessons per week and the BMI. However, a significant difference in childreńs BMI became visible when school playgrounds were also accessible outside opening hours ($p = 0,018$).

Conclusions:

The alarming number of overweight children in Austria should be diminished through policies and further interventions. Schools can make a substantial contribution to this. The course of the development could be closely observed through possible further surveys by COSI.

Key messages:

- 73,2% of the schools include nutrition education in their curricula. Yet, about every third Austrian child aged between 8 and 9 is overweight, with boys being significantly more overweight than girls.
- If school playgrounds are accessible outside opening hours, the childreńs BMI is significantly lower. In urban areas, children have a significantly higher BMI than in rural areas.

Deterioration of housing environment and mental health of asylum seekers – a multi-level analysis

Amir Mohsen Mohsenpour

A Mohsenpour[1,2], L Biddle[1], K Bozorgmehr[1,2]
[1]Department of General Practice and Health Services Research, University of Heidelberg, Heidelberg, Germany
[2]Department of Population Medicine & Health Services Research, University of Bielefeld, Bielefeld, Germany
Contact: amir.mohsenpour@uni-bielefeld.de

Background:

Asylum seekers arriving in Germany are assigned to a local district and an accommodation centre wherein. We developed and validated a six-item questionnaire for rapid assessment of housing deterioration and investigated its association with inhabitant mental health.

Methods:

Using cross-sectional data from a state-wide survey in Germany, we applied a random-effects modelling approach to estimate the exposure effect of housing deterioration on depression and general anxiety among a random sample of asylum seekers, using validated instruments (GAD2/PHQ2) for outcome variables. Housing deterioration was assessed on six items (windows/glass, walls/roof, garbage, graffiti, outside spaces, overall living environment) resulting in a deterioration score as exposure of interest. Additionally, we assessed the instrument's intra- and inter-rater reliability and internal consistency.

Results:

Of the 412 asylum seekers living in 58 accommodation centres, 45.7% reported symptoms of depression and 45.0% suffered general anxiety. Most centres (76.7%) were based in urban municipalities and 45.7% of inhabitants were living in an accommodation centre hosting ≥ 51 inhabitants. Preliminary adjusted odds ratio for accommodation centres with highest deterioration (Q 4) was 2.07 (0.67-6.40) for generalized anxiety, compared to 1.17 (0.45-3.08) for centres with lowest deterioration (Q 1). For depression, preliminary odds ratio was 1.92 (0.87-4.27) compared to 1.26 (0.63-2.50). The validation study confirmed inter-/intra-rater reliability (Brennan-Prediger coefficient: 0.81 and 0.92, respectively) and internal consistency (Crohnbach's α: 0.80).

Conclusions:

There are higher odds ratios for generalized anxiety disorder and depression among asylum seekers based on higher deterioration of housing environment. A questionnaire for rapid deterioration assessment and identification of accommodations needing further evaluation has been developed and successfully validated.

Key messages:

- Deterioration of small-scale housing environment is associated with poorer mental health for asylum seekers living in accommodation centres.
- A highly reliable new tool has been developed for rapid assessment of deterioration status of accommodation centres and identification of those needing further evaluation.

Prevalence of home smoking bans in six European cities: a repeated cross-sectional study (2013-2016)

Daniela Anastasi

D Anastasi[1], *B Federico*[1], *A Rimpela*[2], *M Richter*[3], *L Clancy*[4], *J Perelman*[5], *AE Kunst*[6], *V Lorant*[7]

[1]Department of Human Sciences, Society and Health, Università di Cassino, Cassino, Italy
[2]Faculty of Social Sciences, Tampere University, Tampere, Finland
[3]Institute of Medical Sociology, Martin Luther University, Halle-Wittenberg, Germany
[4]TobaccoFree Research Institute, Dublin, Ireland
[5]Centro de Investigação em Saúde Pública, Universidade NOVA de Lisboa, Lisbon, Portugal
[6]Department of Public Health, University of Amsterdam, Amsterdam, Netherlands
[7]Institute of Health and Society, UCLouvain, Brussels, Belgium
Contact: daniela.anastasi@yahoo.it

Background:

Secondhand smoke exposure is responsible for over half a million premature deaths. With regulation now reducing smoking in most public enclosed spaces, one major source of indoor exposure remains the home environment. Home smoking bans (HSBs) are household rules that restrict smoking from certain (partial HSB) or all areas (complete HSB). Recent data suggest growing trends of HSB adoption over time, but it is not known whether time trends vary according to household characteristics.

Objectives:

The aim of this study is to examine changes in the prevalence of HSB in six European cities between 2013 and 2016, according to socioeconomic characteristics of the household and smoking behavior of household members.

Methods:

Data were collected in all schools participating in both waves of SILNE study in 6 European cities. A self-administered questionnaire was used, targeting students age 14 to 16 (n = 22,326). Students reported their parents' smoking status and if there was a HSB at their home. Detailed information on socio-economic characteristics were collected as well.

Results:

Between 2013 and 2016 the percentage of households with a complete HSB increased from 51.5% to 53.1%, while partial HSB increased from 30.7% to 32.1%. The prevalence of HSB increased in Hannover (G), Latina (I), Amersfoort (N) and Coimbra (P), whereas decreased in Namur (B) and Tampere (F). Socioeconomic differences in HSB were reduced, with larger increases in HSB in households with a lower parental educational level. Increases in HSB were observed among intact households, those without migration background and those with non-smoking parents.

Conclusions:

The increase in the prevalence of HSB observed in most cities and throughout a variety of household types and characteristics between 2013 and 2016 may reflect the effect of smoking denormalization in different social contexts. Further actions of the tobacco control community should target the most vulnerable groups.

Key messages:

- The percentage of households with a complete HSB increased between 2013 and 2016 in 4 out of 6 European cities.
- Increases in the prevalence of HSB over time were observed across all socio-economic groups.

4.P. Innovative approaches to professionalism, communication and care

Differences in attitudes of medical and dental students about e-professionalism on social media

Tea Vukusic Rukavina

T Vukusic Rukavina[1], *D Relic*[1], *M Marelic*[1], *L Machala Poplasen*[1], *J Viskic*[2], *D Jokic*[3], *K Sedak*[4]

[1]Andrija Stampar School of Public Health, School of Medicine University of Zagreb, Zagreb, Croatia
[2]Department of Fixed Prosthodontics, School of Dental Medicine University of Zagreb, Zagreb, Croatia
[3]Department of Orthodontics, School of Dental Medicine University of Zagreb, Zagreb, Croatia
[4]Department of Communication Sciences, Catholic University of Croatia, Zagreb, Croatia
Contact: tvukusic@snz.hr

Background:

Since the use of social media (SM) has increased among health professionals, it is necessary to explore students' use of SM. Aim of this study was to recognize the patterns of SM use and difference in attitudes about e-professionalism on SM among medical and dental students.

Methods:

A cross-sectional study was carried out in the School of Medicine University of Zagreb and the School of Dental Medicine University of Zagreb in academic year 2018/2019. Data were collected using online questionnaires. Data were analysed by descriptive statistics.

Results:

A total of 698 responses were received, 411 from second and fifth year medical students (RR 69%), and 287 from first to sixth year dental students (RR 68%). Facebook was the most commonly used SM platform (99%), followed by Instagram (81%) and YouTube (72%). Dental students significantly more accepted friend requests from patients (28% vs 6%, $P < 0.001$), sent friend requests to patients (5% vs 1%, $P = 0.002$) and significantly more plan to use SM in interaction with patients (39% vs 16%, $P < 0.001$). Attitudes regarding what should be considered as unprofessional online behaviour significantly differed regarding posting patient photographs (90% medical vs 61% dental students, P < 0.001), posting interactions with unidentifiable patients (42% medical vs 23% dental students, P < 0.001) and inappropriate language use (72% medical vs 83% dental students, P < 0.001). Students would find useful existence of guidelines about e-professionalism (84% medical vs 90% dental students, P = 0.016).

Conclusions:

Results showed that dental students are more open to communicating with patients using SM. Results showed difference in attitudes among medical and dental students what constitutes unprofessional behaviour on SM. Results indicate the need to develop guidelines for students regarding e-professionalism.

Key messages:

- The difference exists in attitudes among medical and dental students what constitutes unprofessional behaviour on SM.
- There is a need to develop guidelines for students regarding e-professionalism.

A MOOC to disseminate key concepts related to the future challenges of the French health system

Cécile You

C You[1], V Lissillour[1], A Lefébure[1,2,3]
[1]EHESP French School of Public Health, Rennes, France
[2]UMR CNRS 7116 CSO, Sciences Po, Paris, France
[3]UMR CNRS 6051 ARENES, Rennes 1, Rennes, France
Contact: cecile.you@ehesp.fr

Background:

The increase of life expectancy creates critical health needs that developed countries health systems have to deal with. They are also confronted to persistent health inequalities. A common vision of these issues may not be shared by the health care professionals, decision-makers and citizens. In the context of the launch of new public health laws in France, the French School of Public Health (EHESP) decided to offer a MOOC entitled ‘‘Public Health and Health System: transition and transformation’’ (2019).

Objectives:

The MOOC intends to raise awareness and increase understanding of public health challenges. It is designed for a wide audience of professionals, decision-makers and citizens in the French speaking world. The content was designed by a multidisciplinary team of academics from the EHESP (N = 50) and a network of health professionals (N = 21). The 6 modules address major themes of the recent health policies, e.g. social and territorial inequalities in health, health care security, health pathways, innovation or health democracy.

Results:

Over the course of 6 consecutive weeks, almost 7800 people have enrolled in this e-learning. They are provided with short teaching videos (109 capsules of 4-5’) and webinars, have access to a number of supplementary reading material and a variety of self-assessment. Active learning is enhanced via forum involving peers and teaching staff. The full course represents around 20 hours of teaching. So far, completion rate has attained 13% which compares well with usual rate for MOOCs. Participants include a wide range of professionals, students and citizens from 87 different countries (72% from France) and 50% had a master or higher degree. The overall satisfaction rate is 98%.

Conclusions:

This MOOC attracted the attention of a wide and diverse audience regarding the major public health issues. Some public health agencies have expressed interest in implementing the MOOC into their professional development program of their staff.

Key messages:

- Health system reforms are constantly implemented to face new public health challenges.
- A multidisciplinary MOOC can help raise awareness and understanding of the issue being addressed by new policies.

Evaluation of communication skills among physicians: A systematic review of existing assessment tools

Vincent Gosselin Boucher

V Gosselin Boucher[1,2], C Gemme[1,2], AI Dragomir[1,2], SL Bacon[3,2], KL Lavoie[1,2]
[1]Department of Psychology, University of Quebec at Montreal, Montreal, Canada
[2]Montreal Behavioural Medicine Centre, CIUSSS-NIM, Montreal, Canada
[3]Department of Health, Kinesiology and Applied Physiology, Concordia University, Montreal, Canada
Contact: vincent.gosselin.boucher@gmail.com

Background:

The importance of physician training in communication skills for behavior change counselling in the context of chronic disease management is increasingly recognized. However, little is known about the quality, utility and psychometric properties of existing communication assessment tools.

Objective:

This study systematically reviewed existing assessment tools used to evaluate communication skills among physicians.

Methods:

A systematic review was conducted in accordance with the PRISMA guidelines (CRD42018091932). Four databases (PUBMED, EMBASE, PsychINFO, SCOPUS) were searched up to December 2018, generating 3902 unique articles which were screened by two authors. A total of 57 articles met inclusion criteria and underwent full data extraction.

Results:

Selected studies were published between 1990 and 2018. A total of 45 different assessment tools were identified. Only 47% of the studies mentioned any theoretical basis underlying the design of the tool. The most prevalent communication skills assessed were information giving (46%) or gathering (40%), eliciting patients’ perspective (44%) and agenda planning (37%). Forty-two percent were tool validation studies, but the majority (61%) reported on only one psychometric property. Study quality, using the modified COSMIN checklist, varied considerably, with an average score of 4.5/9 ± 1.3 representing moderate quality.

Conclusions:

Despite identifying a high number of existing physician communication assessment tools, most were poorly validated and a high degree of heterogeneity in terms of skills assessed and study quality was observed. Most used in-person role-play exercises that are intrusive, expensive, and time-consuming, making them impractical for use within most medical contexts. Successful chronic disease management depends not only on feasible and effective communication skills training among physicians, but also on our ability to reliably assess skill acquisition.

Key messages:

- Training physicians’ behaviour change competencies is central to improving lifestyle changes among patients living with a chronic disease.
- Due to the major methodological shortcomings of existing communication assessment tools, we strongly recommend increased methodological rigor for the development of new tools.

Use of voice messaging via mobile phone to communicate female adolescents in Bangladeshi urban slum

Mohammad Shah

M Shah[1], K Rahman[2], H khondker[2]
[1]Global Health, Save the Children US, Washington DC, USA
[2]Sponsorship Program, Save the Children, Dhaka, Bangladesh
Contact: mshah@savechildren.org

Problem:

Utilization of available maternal health services is comparatively low among adolescent population in Dhaka urban slum areas and lack of adequate knowledge is one major contributor to low service utilization among slum dwelling adolescent mothers.

Description of problem:

Dhaka urban slum dwelling female adolescents are difficult to reach adequately with health messages through traditional home visit by community health workers for counseling, because many of these adolescents in Dhaka urban slums have a job outside home. We designed and implemented an innovative health communication intervention ‘‘Health Boost’’ - an approach to provide reproductive, maternal and newborn health information for married female adolescents using the voice message system on mobile phone.

Methods:

We delivered ‘Health Boost’ (HB) voice messages to enrolled married adolescent girls, twice a week, with re-listening option. Pregnant and non-pregnant participants received separate sets of messages. Enrollment was started after baseline survey (September 2016) and continued during October 2016 - April 2017. Pregnant participants received messages at least for 6 months before delivery. For evaluation, we followed pre-post observation study design and had the endline survey in November 2017.

Results:

Comparing HB non-receivers at baseline (n = 321) and HB receivers at endline (n = 45), statistically significant improvement was revealed for knowledge on danger signs - (a) during pregnancy (55.5% vs. 93.3%; $p < 0.001$), (b) during child delivery (54.2% vs. 82.2%; $p < 0.001$), (c) for newborn (56.7% vs. 75.6%; $p < 0.02$). We also found significantly higher utilization of service among HB receivers: Utilization of antenatal care increased from 70.4% to 87.5% ($p < 0.02$); and use of postnatal care increased from 31.6% to 73.7% ($p < 0.03$).

Lessons:

‘Health Boost’ messages were instrumental and effective to increase knowledge and service utilization among married adolescent girls in Dhaka urban slum areas.

Key messages:

- Voice message is an innovative way to reach hard-to-reach population by using mobile phone technology.
- Voice messages were instrumental and effective to increase knowledge and service utilization among urban female adolescent population, for reproductive, maternal and newborn health.

MANTRA: a serious game improving knowledge of maternal and neonatal health and geohazards in Nepal

Patty Kostkova

S Mueller[1], *D Soriano*[1], *A Boscor*[1], *NM Saville*[2], *A Arjyal*[3], *S Baral*[3], *M Fordham*[1], *GJ Hearn*[1], *R Kayastha*[1], *P Kostkova*[1]
[1]Institute for Risk and Disaster Reduction, University College London, London, UK
[2]Institute for Global Health, University College London, London, UK
[3]Health Research and Social Development, Kathmandu, Nepal
Contact: p.kostkova@ucl.ac.uk

Background:

Mobile technology is increasingly important for delivering public health interventions to remote populations. This research study developed, piloted, and assessed a serious game for mobile devices that teaches geohazard, maternal, and neonatal health messages. This unique mHealth intervention aimed at low-literacy audiences in low resource settings is part of the Maternal and Neonatal Technologies in Rural Areas (MANTRA) project: Increasing maternal and child health resilience before, during, and after disasters using mobile technology in Nepal. Specifically, we assess impact of the serious game to improve knowledge gain in our target audience.

Methods:

Co-creation with the MANTRA team and local stakeholders in Nepal identified core needs, developed appropriate pictograms and mechanics, and tailored the pilot game to the local cultural context. Through picture matching with immediate audio and visual feedback, the game teaches 28 learning objectives in three modules: maternal health, neonatal health, and geohazards. To assess the game, 35 participants were recruited in Kathmandu and villages in Kavre district. Sessions consisted of pre-test assessment, playing the game, post-test assessment, and a focus group to elicit qualitative feedback.

Results:

The knowledge assessment quantified knowledge gain. Overall, the group averaged a normalized 6.8 point improvement ($p = 0.000022$). Change in the geohazard module was 9.5 points ($p = 0.001$), followed by maternal health (7.4 points, $p = 0.007$), and neonatal health (4.3 points, $p = 0.83$). Four learning objectives had statistically significant change ($p < 0.05$). Feedback demonstrated high engagement, motivation, and usability of the game.

Conclusions:

This MANTRA study is a unique mhealth intervention of a serious game to teach core health and hazards messages to low-literacy audiences in rural Nepal. The pilot intervention demonstrated statistically significant knowledge improvement among participants.

Key messages:

- The pilot MANTRA mobile serious game intervention is a novel idea, to bring public health knowledge to difficult to reach vulnerable populations, including often ignored illiterate audiences.
- The pilot MANTRA mobile serious game intervention demonstrated a statistically significant knowledge improvement of geohazard, maternal, and neonatal health learning objectives among participants.

4.Q. Work participation and sickness absence

Creating national guidelines for assessing functional and work capacity of recently settled persons

Misha Henriksson

M Henriksson, S Rask, H Anttila, H Kuusio
National Institute for Health and Welfare, Helsinki, Finland
Contact: misha.henriksson@thl.fi

Problem:

The measurement of functioning in clinical practice should be systematic and comprehensive. However, different versions of the same functioning measure are used e.g. by physicians, psychologists, physiotherapists and occupational therapists. The TOIMIA network of experts aims to harmonize and develop the measuring of functioning in Finland.

Description of the problem:

With increasing immigration to Finland, a specific need for guidelines on how to assess functional and work capacity of recently settled persons was identified. Led by the National Institute for Health and Welfare (mobiTARMO-project, 2017-2020), guidelines for assessing functional and work capacity in the integration phase are in preparation.

Results:

The guidelines on assessing functional and work capacity in the integration phase include four principles:

1. Functional and work capacity assessment should be done with culturally and linguistically appropriate methods.
2. Assessment should be based on shared expertise of the professional and the client.
3. Assessment should be comprehensive, and take into consideration physical, psychological, social and cognitive functional capacity, activities of daily living, and environmental factors.

4. Assessment should be systematic and lead to further actions and necessary services.
5. The national guidelines will be disseminated as free online access material in the Terveysportti health portal to professionals in clinical practice and research.

Lessons:

There are specificities to the cross-cultural assessment of functional and work capacity of recently settled persons. National guidelines can be created through broad collaboration of different organizations, as in the TOIMIA network of experts in Finland.

Key messages:

- Jointly agreed principles on how to assess functional and work capacity in the integration phase benefit professionals and clients.
- National guidelines can be created, disseminated and taken into practice through broad collaboration.

The relation between hearing loss and sustainable employability of teachers

Arnold Schriemer

AG Schriemer[1,2]*, CAM Roelen*[2,3]*, FI Abma*[2]*, JJL van der Klink*[4]*,*
U Bültmann[2]
[1]HumanCapitalCare, Enschede, Netherlands
[2]Department of Health Sciences, University Medical Center Groningen, Groningen, Netherlands
[3]Arbo Unie, Utrecht, Netherlands
[4]School of Social and Behavioral Sciences, Tilburg University, Tilburg, Netherlands
Contact: a.g.schriemer@umcg.nl

Background:

Teachers need to hear well. Hearing loss (HL) hinders their daily work. HL is associated with burn-out, depression, sick leave and disability. New retirement policies in The Netherlands encourage people to work longer. Consequently, age-related HL will be an increasing occupational health problem, especially in communicative work such as teaching. Aim of the present study was to examine the relationship between HL and sustainable employability of teachers.

Methods:

We invited teachers to participate in an internet survey. Sustainable employability was measured with the reliable and valid Capability Set for Work Questionnaire. Secondary outcome measures were work ability, self-rated health and sick leave. To determine HL among teachers, we used an online speech-in-noise screening test, supplemented with 4 questions about hearing. Ordinal logistic regression analyses were conducted to examine the associations of HL with sustainable employability, work ability, self-rated health and sick leave, adjusted for age, gender, level of education, current hours at work, work content (teaching or a mix of teaching and other tasks) and working as gymnastics teacher. Odds ratios (ORs) and 95% confidence intervals (CI) were estimated.

Results:

Of the participating $N = 801$ teachers, $N = 521$ had normal hearing and $N = 280$ had hearing loss. HL was associated with a lower capability set (OR 0.56, CI 0.42-0.73), lower work ability (OR 0.34, CI 0.26-0.46), poorer self-rated health (OR 0.41, CI 0.30-0.55) and a non-significant trend towards more sick leave (OR 1.34, CI 0.98-1.85) as compared to normal hearing.

Conclusions:

Hearing loss in teachers was negatively associated with sustainable employability. This underlines the importance of assessing the hearing status of teachers, because of age-related HL especially in those aged 50+. Teachers with HL should be advised on supportive measures, e.g. hearing aids, improved acoustics in the workplace and tasks with less oral communication.

Key messages:

- Measuring the hearing status, e.g. in periodical health examinations, is highly advisable for sustained employability of teachers.
- Teachers with hearing loss should be counselled on possible interventions to support them in their work.

Goal-focused group intervention; sustainable health improvement but no effect on work participation

Nils Fleten

N Fleten[1,2]*, T Fyhn*[3]*, TH Tveito*[3]
[1]Department of Community Medicine, UiT The Artic University of Norway, Tromsø, Norway
[2]Norwegian Welfare Organisation, Troms and Finmark, Tromsø, Norway
[3]Uni Research Health, NORCE, Bergen, Norway
Contact: nils.fleten@uit.no

Background:

Sick leave in Norway is high relative to other OECD-countries, but few of numerous work rehabilitation efforts are evaluated adequately. Financed by research and development grants from the Norwegian Work- and Welfare Directorate we explored the effect of goal-focused group intervention in the Norwegian Welfare organisation in Troms, Northern-Norway.

Methods:

In a randomised controlled trial, we compared a goal-focused group intervention to receiving a 3-month membership card at a local gym. Main outcomes were work participation, self-rated health (0-100), functioning EQ-5D, and subjective health complaints, (29 items, 0-3). Most participants were long time sick-listed, and recruited from welfare service caseworkers. We collected surveys at baseline, 3 and 15 months, and corresponding register data on work participation.

Results:

Participating persons, 89 in the group intervention and 63 in the gyms, were comparable in age and gender, 85% women. Self-rated health scores improved in both groups at 3 months. At 15 months, the control group were back at basis while improvement sustained in intervention group, Initial scores 50.9 (95% CI 47.4-54.4), 3 months 58.1 (52.4-63.8) and 15 months 58.6 (51.8-65.4). In favour of intervention the difference in difference of scores on subjective health complaints was 2.34, $p = .056$ at 3 months, and 4.01, $p = .035$ at 15 months. Mean total score on EQ-5D and daily living function improved significantly in the intervention group 8.09 - 7.67 (95% CI7.26-8.07), and 1.91-1.70 (1.53-1.86) respectively in 15 months. Work participation did not reflect these improvements. Both groups reached mean 98 workdays within 15 months follow-up.

Conclusions:

Goal-focused group intervention has the potential to improve self-rated health and functioning, but gives no immediate effect on work participation.

Key messages:

- Goal-focused group intervention among sick-listed is cost effective focusing health related quality of live.
- Improving health and function is important but not sufficient to speed up return to work.

Work stress, migration background and risk of long-term sickness absence in Denmark

Reiner Rugulies

R Rugulies[1,2,3]*, JK Sørensen*[1]*, IEH Madsen*[1]*, M Nordentoft*[1]*,*
K Sørensen[1]*, E Framke*[1]
[1]National Research Centre for the Working Environment Denmark, Copenhagen, Denmark
[2]Deparment of Public Health, University of Copenhagen, Copenhagen, Denmark
[3]Department of Psychology, University of Copenhagen, Copenhagen, Denmark
Contact: rer@nrcwe.dk

Background:

Work stress may increase risk of long-term sickness absence, but little is known if this association differs by migration background. In this study, we examined the prospective association between effort-reward imbalance at work and risk of long-term sickness absence in individuals with and without migration background in the Danish workforce.

Methods:
We included 59,468 respondents from a nationwide survey on work and health, 3,226 with a migration background (immigrants or first generation descendants of immigrants) and 56,242 without a migration background. Effort-reward imbalance was assessed by self-report. Migration background and long-term sickness absence (spells ≥6 weeks) were assessed by national register data. Using Cox regression, we estimated the association between effort-reward imbalance and onset of long-term sickness absence during 12 months follow-up separately for participants with and without a migration background, adjusted for age, sex, education and previous long-term sickness absence.

Results:
The effort-reward imbalance score at baseline was similar for respondents with and without a migration background. The hazard ratio for long-term sickness absence during follow-up per 1 standard deviation increment in effort-reward imbalance at baseline was 1.26 (95% CI: 1.16-1.37) and 1.16 (95% CI: 1.13-1.20) for respondents with and without a migration background, respectively.

Conclusions:
Work stress, measured by effort-reward imbalance, is associated with an increased risk of long-term sickness absence in workers with and without a migration background in Denmark. Although the estimate was higher in workers with a migration background, confidence intervals overlapped indicating that associations were similar in both groups. The results suggest that prevention activities on effort-reward imbalance and long-term sickness absence should not be prioritized by migration background but should be offered to the whole workforce.

Key messages:

- Work stress, measured by effort-reward imbalance, is associated with an increased risk of long-term sickness absence in workers with and without a migration background in Denmark.
- The results suggest that prevention activities on effort-reward imbalance and long-term sickness absence activities should be offered to the whole workforce.

Socioeconomic differences in paid sickness allowances in Finland

Jenni Blomgren

J Blomgren[1], *S Jäppinen*[1], *J Pekkala*[2], *O Rahkonen*[2]
[1]Research Unit, The Social Insurance Institution of Finland, Helsinki, Finland
[2]Department of Public Health, University of Helsinki, Helsinki, Finland
Contact: jenni.blomgren@kela.fi

Background:
Receipt of sickness allowance (SA), which in the Finnish benefit system functions as compensation for loss of income due to over 10-days-long sickness absence, is more prevalent in lower socioeconomic groups. As SA is an earnings-related benefit and higher occupational classes have on average higher previous income, their share of SA expenditure must be higher than their share of SA days would suggest. However, the allocation of SA costs to different socioeconomic groups is not known. The aim of this study was to compare occupational classes in terms of their shares of total paid SA days and SA benefit costs.

Methods:
We used register data covering the total working-age (16-64) employed population of Finland at the end of 2016 (N = 2.2 million), with linked data on paid sickness allowances during 2017. Yearly accumulated sickness allowance days and allowance costs, paid by the Social Insurance Institution of Finland, were calculated for upper and lower non-manual employees, manual workers and self-employed persons.

Results:
Of the total yearly SA days of the employed population, 13% were paid to upper non-manual employees, 40% to lower non-manual employees, 37% to manual workers and 10% to the self-employed (the respective shares of these occupational classes of the employed population were 23%, 36%, 30% and 11 %). The average gross allowance was 77€ per day among upper non-manuals and between 54€ and 60€ in the other groups. Accordingly, upper non-manuals accounted for a larger share of the SA costs compared to their share of SA days: the proportions of costs were 16%, 39%, 36% and 9% in each occupational class, respectively.

Conclusions:
The results show that as the average amount of daily sickness allowance is distributed in an opposite manner compared to the prevalence and length of sickness allowance spells, socioeconomic differences in sickness allowance costs are smaller than differences in the prevalence of sickness allowance.

Key messages:

- Upper non-manual employees have a lower prevalence of sickness absence and shorter spells than other occupational groups.
- Because of higher earnings-related sickness allowance among upper non-manual employees, their share of sickness allowance costs is higher than their share of sickness allowance days.

Work participation trajectories in 1098748 Finns: determinants and the incidence of sickness absence

Tea Lallukka

T Lallukka[1,2], *E Kronholm*[2], *J Pekkala*[1], *S Jäppinen*[1,3], *J Blomgren*[3], *O Pietiläinen*[1], *E Lahelma*[1], *O Rahkonen*[1]
[1]Department of Public Health, University of Helsinki, Helsinki, Finland
[2]Finnish Institute of Occupational Health, Helsinki, Finland
[3]The Social Insurance Institution of Finland (Kela), Helsinki, Finland
Contact: tea.lallukka@helsinki.fi

Background:
Early exit from paid employment is a notable public health and societal challenge. Previous research has largely focused on the relationships among variables instead of the relationships among individuals with different work participation history. Person-oriented methods enable to identify latent groups of individuals who are likely to follow similar development in their work participation over time. We thus aimed to identify work participation trajectories during early and midlife careers and their social determinants. A further aim was to determine the cumulative incidence of sickness absence due to key diagnostic groups, mental disorders and musculoskeletal diseases within the trajectories.

Methods:
Young (25-38 years at baseline, n = 495663) and midlife (39-52 years at baseline, n = 603085) Finnish people, working in 2004, were followed up through 2013, with registers of the Social Insurance Institution, and the Statistics Finland. The registers provided data for the outcome (work participation) and its determinants and sickness absence. Latent class growth analysis was used to identify trajectories.

Results:
Three distinctive trajectories were identified: temporary exit, permanent exit, and continuously employed people. As compared to the other trajectories, those belonging to the permanent exit trajectory were more likely men, manual workers and had a lower income. The cumulative incidence of sickness absence due to mental disorders was highest in the permanent exit trajectory group. For musculoskeletal diseases, the cumulative incidence of sickness absence increased in the permanent exit trajectory mainly in the older age groups.

Conclusions:
Distinct group-based trajectories of early work exit can be identified in a representative cohort of initially employed people. Focusing on the determinants of premature exit and early intervention to tackle increasing sickness absence may promote work participation particularly in the most vulnerable groups.

Key messages:

- Distinct trajectories of premature exit from paid employment can be identified in a nationally representative cohort of initially employed people from Finland.
- Focusing on the determinants and reasons of premature long-term labor market exit may help promote work participation particularly in the most vulnerable groups.

Sickness absences among young employees in private and public sectors

Jurgita Narusyte

J Narusyte[1,2], P Svedberg[1]
[1]Division of Insurance Medicine, Karolinska Institutet, Stockholm, Sweden
[2]Stockholm County Council, Stockholm, Sweden
Contact: jurgita.narusyte@ki.se

Background:

Mental health problems among young adults is a public health problem as well as increasing work incapacity in terms of sickness absence (SA) due to mental diagnoses in Sweden. SA levels among those working in the public sector tend to exceed those working in the private sector. Knowledge is however lacking on whether experiencing mental health problems in young years can contribute to the association. The aim was to examine the association between type of employment and sickness absence among women and men, also adjusting for previously experienced depression and anxiety as well as for familial factors.

Methods:

The study included data on 25,496 twins born in Sweden 1959-1990. Information on depression and anxiety as well as on type of employment was obtained from a web-based survey conducted in 2005. Twins were followed prospectively until 2013 through national register data on SA. Logistic regression analyses were run with adjustment for familial factors, such as common genetics and environmental factors related to the family. Odds ratios (OR) with 95% Confidence Intervals (CI) are presented.

Results:

Higher rates of SA in the public (59%) as compared to the private (50%) sector were observed among women. There were 29% and 30% of men in public and private sectors, respectively, that have had at least one SA spell during the follow-up. Preliminary results showed that working in the private sector was associated with a higher risk for future SA among women (OR 1.63, 95% CI 1.14-2.33) but not among men (OR 0.66, 95% CI 0.41-1.07). The results changed only slightly after adjusting for previous depression or anxiety as well as for familial factors.

Conclusions:

Higher rates of SA among women working in the public as compared to the private sector were not explained by previously experienced depression or anxiety disorders.

Key messages:

- Higher rates of SA were observed among women working in public as compared to private sector.
- Previously experienced depression and anxiety were of similar importance for future SA in both public and private sectors.

Organizational climate and work commitment as predictor of 10-year registered sickness absence

Marit Knapstad

M Knapstad[1,2], L Lissner[3], C Bjorkelund[4], K Holmgren[5]
[1]Department of Clinical Psychology, University of Bergen, Bergen, Norway
[2]Department of Health Promotion, Norwegian Institute of Public Health, Bergen, Norway
[3]Department of Public Health and Community Medicine, University of Gothenburg, Gothenburg, Sweden
[4]Department of Public Health and Community Medicine, Primary H, University of Gothenburg, Gothenburg, Sweden
[5]Department of Health and Rehabilitation, University of Gothenburg, Gothenburg, Sweden
Contact: marit.knapstad@uib.no

Background:

Early identification of persons at risk for sickness absence offers an opportunity to put in place preventive measures in the future. The Work Stress Questionnaire (WSQ) is specifically designed to identify people at risk for sickness absence due to work-related stress. In this study we examine prospective associations between work-related stress as measured by the WSQ and registered sickness absence up till 10 years later among employed and self-employed women in the general population in Gothenburg.

Methods:

This is a survey-linkage study based on the 2004-05 wave of the Swedish "Population Study of Women in Gothenburg (PSWG)" and 10-year follow-up in the MiDAS sickness absence register. Participants registered as employed or self-employed were included (n = 396). Outcomes were number of sickness absence episodes during follow-up and sickness absence during each two-year time band of follow-up.

Results:

High perceived stress due to poor organizational climate, compared to low stress, gave an adjusted Incidence Risk Rate (IRR) of 1.99 [95% CI 1.19-3.34] for sickness absence episodes. Combining high perceived stress due to poor organizational climate with high perceived stress due to work commitment gave an IRR of 2.32 [95% CI 1.26-4.26]. Examining separate time periods, similar associations were found during years 5-6 and 7-8. Perceived low influence at work also gave increased odds for sickness absence, at both in the shorter term (1st-2nd year) and longer term (7th-8th year).

Conclusions:

The findings align with previous studies that WSQ may successfully identify women with elevated risk for future sickness absence, and adds that this is even true in a general population context and using a very long follow-up period. Nevertheless, the findings should preferably be confirmed using a larger sample to improve precision of the observed associations.

Key messages:

- The present study contribute with knowledge about screening instruments that may identify women in the general working population with elevated risk for sickness absence.
- The findings suggest that high perceived stress due to organizational climate, alone and in combination with high work commitment, as well as low influence at work, increase risk of sickness absence.

5.A. Place and other social determinants of health disparities

Rural primary care: a scoping review

Mark Bosmans

M Bosmans[1], WGW Boerma[1], PP Groenewegen[1]
[1]NIVEL, Utrecht, Netherlands
Contact: m.bosmans@nivel.nl

Background:

Access to primary care is unequally distributed. Especially in rural and remote areas access to primary care services is problematic. As many countries, large and small, recognize the challenge of providing accessible and good quality primary care and implement different strategies to address this challenge, there are opportunities for cross-national learning. The main aim of this report is to provide information on best practices and solutions to counter the risk of a primary care vacuum in rural and remote areas.

Methods:

In this scoping review of the literature on primary care in rural areas we made an inventory of evidence from research of the past 10 years. The research literature from January 2008 to June 2018 was captured through searches of the databases of Medline, Cochrane and EMBASE. In addition, we included relevant grey literature from within the WHO European region.

Results:

The following four groups of strategies have been identified and can be used to address rural primary care shortages:

- substituting roles within multidisciplinary primary care teams
- smart recruitment, retention and training strategies focused on staff in rural areas
- implementing technological innovations in information and communication
- as a short term solution: promoting the mobility of health care workers and patients

Conclusions:

The evidence base with regard to interventions to improve access to primary care in rural areas is narrow, lacking sufficient methodologically sound research, making definitive conclusions about their effectiveness impossible. Additionally, the available evidence is biased towards programmes targeting physicians. Nevertheless, the literature does offer indications of promising intervention types, and provides valuable recommendations for their implementation.

Key messages:

- Implementation of strategies should always be accompanied by systematic monitoring of outcomes.
- Interventions should include primary care workers other than physicians.

Assessment of the spatial accessibility to health professionals at French census block level

Fei Gao

F Gao[1], *S Deguen*[2]
[1]METIS, EHESP, Rennes, France
[2]DSET, EHESP, Rennes, France
Contact: fei.gao@ehesp.fr

Background:

The evaluation of geographical healthcare accessibility in residential areas provides crucial information to public policy. This work developed an improved indicator: the Index of Spatial Accessibility (ISA) to measure geographical healthcare accessibility at the smallest available infra-urban level, that is, the Îlot Regroupé pour des Indicateurs Statistiques.

Methods:

This study was carried out in the department of Nord, France. Healthcare professionals are geolocalized using postal addresses available on the French state health insurance website. ISA is derived from Enhanced Two-Step Floating Catchment Area (E2FCA) algorithm. We have constructed a catchment for each healthcare provider, by taking into account residential building centroids, car travel time as calculated by Google Maps and the edge effect. Principal Component Analyses (PCA) were used to build a composite ISA to describe the global accessibility of different kinds of health professionals.

Results:

We applied our method to studying geographical healthcare accessibility for pregnant women, by selecting three types of healthcare provider: general practitioners, gynecologists and midwives. A total of 3587 healthcare providers are potentially able to provide care for inhabitants of the department of Nord. On average there are 92 general practitioners, 22 midwives and 21 gynecologists per 100,000 residents. The composite ISA for the three types of healthcare provider is 39 per 100,000 residents.

Conclusions:

ISA is a multidimensional and improved measure, which combines the volume of services relative to population size with the proximity of services relative to the population's location, available at the smallest feasible geographical scale. It could guide policy makers towards highlighting critical areas in need of more healthcare providers, and these areas should be earmarked for further knowledge-based policy making.

Key messages:

- Indicator of healthcare access at fine spatial scale allows us to identify precisely critical areas where healthcare professionals need to be allocated.
- ISA is a multidimensional measure, which combines the volume of services relative to population size with the proximity of services relative to the population's location.

Levelling the Playing Fields: A Pilot Intervention

Stephanie Alexander

S Alexander[1], *K Frohlich*[2]
[1]Prevention and Health Promotion, MGEN Foundation for Public Health, Paris, France
[2]School of Public Health, University of Montreal, Montreal, Canada
Contact: sac.alexander@gmail.com

Despite the benefits of outdoor free-play for children (physical activity, well-being, independent mobility), access to urban spaces for play is on the decline in many cities. As such, there are increasing calls from public health officials, city planners and childhood advocates in Canada to promote outdoor play in cities. Responding to these calls, our pilot intervention will examine whether creating urban play spaces through road closures around schools and in neighbourhoods can increase children's outdoor play, physical activity and social interaction among residents.

The year-long intervention will involve road closures in four Montreal (Canada) neighbourhoods with different socio-economic profiles. After a diagnostic portrait of each site, participatory planning will engage children aged 8-12 and youth aged 13-18 to help redesign their neighbourhood streets for better access and playability. Outdoor play will be measured using a ''playability index'' to determine if increased outdoor play is due to intervention changes. Children's physical activity, play and mobility patterns will be captured with GPS loggers and accelerometers, and play duration and location will be recorded through daily diaries. Questionnaires will be given to parents and children regarding changing behaviours and perceptions about outdoor play, risk/safety and independent mobility. While still in a pilot phase, this paper will present the intervention approach and outline how it promises to impact multiple components of urban life for children and adults (physical/mental health, safety, social interaction, environment/equity).

The intervention is innovative by engaging children and families in its design and development, and by involving schools, municipalities and residents in its implementation and assessment. This co-creation and development promises broad impacts on local social practices and policy development, results which may be transferable to other Canadian and international cities.

Key messages:

- Access to urban outdoor play is critical for children's well-being. Road closures can increase urban outdoor play, thereby contributing to physical and mental health and promoting social interaction.
- Child and youth participation in the planning and development of urban play spaces can increase their relevance and broaden their social, environmental, health and policy impacts.

Health care in Amazon communities for education and awareness about health in low resource settings

José Anibale Jr

GC Olavarria[1], IS Ricioli[1], HF Greco[1], VGB Mont'Alvão[1], RS Pizzato[1], AS Czszacki[1], JNM França[1], GM Succi[1], FMP Succi[1], ARR Freitas[1]
[1]Epidemiology, Faculdade São Leopoldo Mandic, Campinas, Brazil
Contact: joseanibalejr@gmail.com

Background:

Brazil has an extensive area and social differences. Indigenous peoples and other minorities still have great difficulty in accessing health. Although increase in the number of medical graduates, there has been a low number of professionals joining the jobs offered in the remote areas.

Objectives: The objective of this project is to sensitize health students to the importance of meeting the health demands of the populations in remote areas and low resource settings through practical experience in the care of the indigenous communities of the Amazon region supervised by teachers.

Results:

The Mandic Health Boat team consists of about 40 to 50 members: 8-10 physicians (epidemiologist, pediatrician, general practitioner, gynecology, dermatology and ophthalmology), nurses, dental surgeons, 16 medical graduates , 6 dentistry graduates, 1 dental technician and 1 optician. The trips are 10 days long and are organized in integration with the local population and the health district so that the tasks are integrated into the routines of health actions. To date, the project has already carried out two expeditions and another is scheduled in June 2019. In the last one, 1619 medical consultations were performed and 639 dental consultations were donated 574 glasses and performed 97 surgeries for pterygium excision.

Conclusions:

Through this program it was possible to put the academics in contact with the reality of the indigenous communities and to raise awareness of the difficulties of these original peoples. It was also possible to provide health education and medical and dental care, with spotlight to dental prostheses and glasses, that are particularly difficult to access because they require materials and equipment that are unavailable in the forest. This experience provides health to the original populations and favors the students' awareness to social problems, as well as being an innovative scenario for the learning process in the health area.

Key messages:

- This experience provides health to the original populations and favors the students' awareness to social problems, as well as being an innovative scenario for the learning process in the health area.
- The planning of the expeditions with the community leaderships and the local health authorities allow the integration of the actions realized through annual trips to the routines of the health care.

Income inequality in disability-free life expectancy in Denmark

Henrik Brønnum-Hansen

H Brønnum-Hansen[1], E Foverskov[1], I Andersen[1]
[1]Department of Public Health, University of Copenhagen, Copenhagen, Denmark
Contact: henrik.bronnum-hansen@sund.ku.dk

Background:

The state old-age pension in Denmark is adjusted in line with the projected increasing life expectancy without taking social inequality in health and life expectancy into account. The purpose of the study was to estimate income disparities in life expectancy and disability-free life expectancy (DFLE) at age 50.

Methods:

By linking nationwide register data on income and mortality each individual at any age was divided into equivalised disposable income quartiles and life tables were constructed for each quartile. Data from the Danish Survey of Health, Ageing and Retirement in Europe (SHARE) was linked to register data providing access to information on respondents equivalised disposable income. Finally, data from the life tables were combined with prevalence on activity limitations by income quartiles from SHARE to estimate DFLE by Sullivan's method. Differences in DFLE were investigated and decomposed into contributions from mortality and disability effects.

Results:

A clear social gradient was seen for life expectancy as well as DFLE. Thus, life expectancy at age 50 differed between the highest and lowest income quartile by 8.0 years for men and 5.0 years for women. The difference in DFLE was 11.8 and 10.3 years for men and women, respectively. For men the mortality effect from the decomposition contributed by 4.1 years to the difference of 11.8 years in DFLE and 3.9 years to the difference in expected years with disability of 3.8 years while the disability effect contributed by 7.7 years.

Conclusions:

The study quantifies social inequality in health in Denmark. Although income inequality in life expectancy and DFLE can partly be explained by loss of income due to chronic diseases, one would expect a welfare state to provide better financial security for citizens with health problems. Furthermore, the marked social disparity when approaching retirement age is questioning the fairness of implementing a pension scheme independently of socioeconomic position.

Key messages:

- Disability-free life expectancy differs between income quartiles by more than 10 years.
- Pension age follows the projected increasing life expectancy independently of socioeconomic position. This seems unfair.

Social networks as a public health tool - ''Non-smoking bars and restaurants''

Andelka Grujičić

A Grujičić[1], S Mladenović Janković[1], D Matijević[1], G Tamburkovski[1], M Marković[1]
[1]Health Promotion Center, Institute of Public Health of Belgrade, Belgrade, Serbia
Contact: andjelka.grujicic@zdravlje.org.rs

Issue/problem:

In Serbia, 34,7% of adults are smokers. Although Framework Convention of Tobacco Control was signed in 2005, there are measures still not applied. Implementation of the existing laws on tobacco control is inconsistent. Inadequate regulation is particularly related to catering objects - restaurants and cafes, which contributes to a general tolerance towards smoking. Although 84% of the population is aware of the harmful effects of second-hand smoking, complete smoking ban in restaurants and cafes is supported by only 19% and 14%, respectively.

Description of the practice:

The initial idea was to identify smoke-free catering objects, as well as those that properly obey current laws. This led to creation of a Facebook page with a map of such objects in Belgrade. Another goal was to raise awareness about the effects of second-hand smoking and encourage people to articulate their needs, but also to emphasize the significance of this topic to the media and other relevant parties.

Effects:

In two years, the page reached nearly 4000 organic followers. It is daily used for sharing news and study results and for discussing tobacco control related topics. Some posts reach up to twenty thousand Facebook users. The map includes over 100 strictly non-smoking catering locations. The page has been further publicized via popular internet portals, newspapers, TV channels, specialized magazines and foreign tourist guides.

Lessons:

The page has revealed the suppressed need of the majority to express the intolerance to second-hand smoke. Even though most catering owners are hesitant to declare smoke-free areas, fearing a negative business impact, others see the page as a good promotion channel. The initiative has also been recognized by different parties with an idea of future joint action.

Key messages:
- Social networks are a powerful tool to broadcast public health initiatives and encourage people to take actions.
- Social media communities have potential to create a persistent influence on stakeholders to lobby for new regulations.

5.B. Workshop: Bridging the health divide across the Mediterranean: an agenda for public health research and polic

Organised by: EUPHA, WFPHA, SFSP
Chair persons: Yves Charpak - SFSP, Bettina Borish - WFPHA
Contact: yvescharpak@gmail.com

Objectives:

Develop 3-4 areas for intensified collaboration

The Mediterranean region has a rich history and is home to some of the earliest civilisations. Today, the Mediterranean is often in the news as a result of tragic events and unrest including conflict and loss of lives at sea. Political meetings such as the South EU summit of Southern European leaders and the 5 + 5 EuroMed are useful events to highlight the priority policy issues of this region. Yet, health has rarely been at the forefront of the political agenda for the Mediterranean. The migrant crisis comes as a timely reminder that there exists a full continent on the other side of this sea and border countries from Africa, themselves in active processes of reform and change, should be seen as neighbours with whom the European public health community needs to collaborate.

The purpose of this workshop is to shine a light on the health divide across the Mediterranean, to highlight key epidemiological, health systems and global health governance issues of priority to the region.

It aims to stimulate an initial discussion for a public health research and policy focus on the Mediterranean region which could eventually lead to a call for action and a programme of activities at international level.

Our neighbours share with us several public health challenges, from financing of health systems, epidemiological transition toward NCD diseases, environment and life style risks, human resources for health challenges and migrant issues from other parts of the continent.

Marseille, as the conference location, provides a unique opportunity to debate and exchange with the three Maghreb countries facing the southern border of Europe.

Key messages:
- Maghreb health systems are in transition, all three rather different, but rather close to some European and EU health systems regarding financing, priorities, social and regional inequalities in access to health services, aging and NCD growth pressure. How can they become a part and contribute to the very active European Public Health analysis and benchmarks on optimizing health systems performance?
- Part of the health crisis regarding migrants in Europe is also an issue for health care systems in Maghreb countries. Are there ways to collaborate, to implement real collaborative and joint actions?
- Maghreb countries face a very specific crisis because of European policies of attracting health professionals: the brain drain is a significant issue, endangering the capacity of the Maghreb health systems. Do we foresee solutions to it?
- Maghreb countries face the same transition as Europe toward chronic diseases' increased burden due to global changes in lifestyles and exposure to globalized health risks, But also thanks to improved health care and longer life expectancies. Fighting an increase in some risk factors can only be global or regional, with joint actions in need of forgetting the presence of the sea. Chronic disease is also an issue for international organizations: for example, such discussion could bring the three WHO regional officers involved around the Mediterranean Sea closer.

5.D. Workshop: Paving the path to the health systems of the future

Organised by: Chafea, EUPHA, DG Sante
Chairperson: Anne-Marie Yazbeck, Chafea
Contact: anne-marie.yazbeck@ec.europa.eu

Reforming health systems is a priority that is being addressed at local, regional, national and European level. Health system reforms are complex; they require political commitment, know-how, skills and sustained financial investments. The EU can provide support in various stages of such reforms: from initiation to design and to implementation. The session will describe the main EU tools for this, such as the European Semester, programmes that can offer technical assistance, as well as programmes that provide opportunities for financial support.

5.E. Skills building seminar: Making the elevator pitch work: how to convince a policymaker in less than 2 minutes

Organised by: EUPHA, EUPHAnxt
Chair persons: Dineke Zeegers Paget - EUPHA, Maaike Droogers - EUPHA
Contact: d.zeegers@euphaoffice.org

Since a number of years, EUPHA, the European Public Health Conference and other associations, have been working hard to translate the evidence in a such a format that policymakers take notice. The work by WHO Europe on 'telling the public health narrative' or providing factsheets and infographics is an example. EUPHA has organised several skills building workshops on translation of evidence in the past years (e.g. 2018: You say tomatoe, I say tomato). The European Public Health Conference introduced the so-called pitch presentations (at Glasgow 2014), where researchers are asked to present their work in 5 minutes with maximum 5 slides (no animations), a way to learn to present key messages from research in just a few minutes.

But what should you do, if you meet your policymaker in the hallway or in an elevator? Can you present your work, including key messages, without slides? And in less than 2 minutes? You should be able to.

In this skills-building workshop, we will select a number of abstracts that have been accepted by the International Scientific Committee as posters and we will invite the presenting authors to this dare: present your work and key messages in less than 2 minutes. In order to see whether the policymaker is convinced, we are organising a small panel of policymakers and ask them to give their feedback. Are they interested? Do they remember the key message? And if all goes well, do you get an invitation to come back and present more of your work?

Key messages:

- Being able to present your key messages anywhere, anytime is needed.

5.F. Sexual life, sexual health and gender: connecting the dots

Does Sense make sense? Mixed methods study of a Dutch sexual health program

Rosa Joosten

R Joosten[1], L Jochems[2], C Wijsen[3], T Heijman[4], A Timen[1]
[1]Centre for Infectious Disease Control, RIVM, Bilthoven, Netherlands
[2]Health sciences, VU University Amsterdam, Amsterdam, Netherlands
[3]International Research Department, Rutgers, Utrecht, Netherlands
[4]Department Infectious diseases and Inspection, Public Health Service Amsterdam, Amsterdam, Netherlands
Contact: rosa.joosten@rivm.nl

In the Netherlands, the Sense program addresses several key elements of sexual health for young people <25 year. This program offers free consultations at the PHS concerning STI, contraceptives, pregnancy or sexuality. The performance of this program has not been studied yet. This mixed methods study investigates facilitators and barriers of a Sense consultation from the perspective of clients and health care professionals (HCP) and investigates the outcome of the consultation at three points in time. Semi-structured interviews were conducted after consultation among 16 clients and 6 HCP. Questionnaires were collected directly after consultation and at 3, 6 and 12 months after consultation. Two cohorts were recruited; clients with STI consultation only and clients with questions related to sexuality, contraception and pregnancy (Sense consultation, SC). Satisfaction of the consultation and applicability of the given advice was measured. In the follow up presence of STI, pregnancy, sexual problem and contraceptive use was measured. A minority of the interviewed clients were familiar with Sense, highly valued the expertise of the HCP and the open atmosphere during the consultation. Reasons for visiting

Sense included expertise, more anonymity and feeling more comfortable than at the GP. The questionnaire after consultation was returned by 144 STI clients and 32 SC clients. Both type of consultation were highly valued and advice was easily applicable. The follow up cohort included 97 STI clients and 23 SC clients. Response rate of the 3- and 6 month-questionnaires was 61%. Results of the full one year follow-up are expected in September 2019. Study results provide evidence for a highly valued Sense program, by both clients and HCP. Sense is a platform to discuss STI, contraception and sexuality in an open atmosphere, though familiarity with Sense is low. A major conclusion is that an STI consultation provides the opportunity to address questions related to sexuality.

Key messages:

- The Sense program is highly valued by young people, and yet the program is not widely known among young people.
- There is need for more publicity to the program to enable more young people to use this program and to improve the sexual health care of young Dutch people.

Sexuality education in Europe – An assessment of the current state, challenges and good practice

Laura Brockschmidt

L Brockschmidt[1], *O Ivanova*[2], *E Ketting*[3]
[1]International Relations Unit, Federal Centre for Health Education (BZgA), Cologne, Germany
[2]Division for Infectious Diseases and Tropical Medicine, Ludwig Maximilians University (LMU), Munich, Germany
[3]Freelance consultant on sexual and reproductive health and rights, Zeist, Netherlands
Contact: laura.brockschmidt@bzga.de

Background:

Comprehensive sexuality education is a crucial factor for protecting the health and well-being of children and young people. A recent assessment, conducted by the Federal Centre for Health Education and the International Planned Parenthood Federation European Network (IPPF EN), gives an up-to-date overview of the current status of sexuality education (SE) in schools in 25 European and Central Asian countries. It further provides information on challenges and good practice in this field.

Methods:

Pre-tested questionnaires were sent to representatives of governmental (Ministries of Health or Education) and nongovernmental organisations (IPPF member associations) in 25 countries in Europe and Central Asia. All representatives of the nongovernmental (25) and two-thirds of those in governmental organisations (16) responded. The questions were grouped under five themes related to SE: legal framework, status of implementation, barriers and opposition, youth-friendly sexual and reproductive health (SRH) services, and national data on adolescent SRH.

Results:

In 15 of the 25 countries surveyed, a legal framework exists (law/ policy/ strategy) which supports SE in schools. In 11 countries, SE is mandatory in schools, and in 10 countries SE clearly has a comprehensive character. In most countries, SE is integrated into broader teaching subjects, e.g. biology or life skills education. A lack of teacher training and of monitoring and evaluation of SE programmes has been identified in the majority of countries.

Conclusions:

In the past two decades, remarkable progress has been made in developing and implementing SE in the region. Nevertheless, further improvements are urgently needed, as differences between and within countries persist. These include the quality and the comprehensiveness of SE programmes, the monitoring and evaluation of these programmes and the development and implementation of teacher training.

Key messages:

- Remarkable progress has been made in implementing sexuality education in Europe and Central Asia.
- Nevertheless, further action is needed to reduce differences in implementation and quality between and within countries.

PrEP users among Lisbon MSM Cohort participants – A first look after PrEP implementation in Portugal

Francisco Fernandes

F Fernandes[1,2], *P Meireles*[1], *M Rocha*[3,4], *J Rojas*[3,4], *H Barros*[1,5]
[1]EPIUnit, Instituto de Saúde Pública, Porto, Portugal
[2]Unidade de Saúde Pública, ACES Baixo Mondego, Figueira da Foz, Portugal

[4]Coalition PLUS Community-Based Research Laboratory, Lisbon, Portugal
[5]Faculdade de Medicina, Universidade do Porto, Porto, Portugal
Contact: ffernandes.ecs@gmail.com

Background:

Pre-exposure prophylaxis (PrEP) with tenofovir/emtricitabine has shown to be effective in preventing HIV among high-risk HIV-negative men who have sex with men (MSM). Portugal made PrEP available in February 2018, but few MSM reported PrEP use before. We aimed to compare the sociodemographic characteristics of MSM using PrEP and those knowing PrEP but not using and to compare MSM who started PrEP before and after its implementation in Portugal.

Methods:

We performed a cross-sectional analysis, using Lisbon MSM Cohort data - an open prospective cohort of HIV-negative MSM testing at a community-based center in Lisbon - regarding the first time PrEP use was reported. Data from March 2015 to April 2019 was used. In this period 2142 MSM participated in the cohort and reported to know PrEP of whom 160 (7.5%) reported to use it. 83 PrEP-users answered a subset of questions about PrEP. Comparisons were performed using t-test, Chi-square or Fisher's exact test.

Results:

Comparing with non-users, PrEP users were significantly older (Mean: 35.7, SD 9.4 vs. 30.8, SD 9.2, $p < 0.001$), had more frequently a Master or PhD degree (37.2% vs. 27.4%, $p = 0.017$), and were more frequently born in a foreign country (42.2% vs. 31.8%, $p < 0.001$). Groups were similar in terms sexual orientation. Among the 83 PrEP users answering more questions about PrEP, 28 (33.7%) reported to have ordered their PrEP medication online, 24 (28.9%) obtained it in a medical appointment in Portugal, 15 (18.1%) in a foreign country, 4 in a clinical trial or demonstration project. Of all PrEP users, 30 (19.4%) started PrEP only after February 2018, and no sociodemographic differences were found comparing with those who started before.

Conclusions:

MSM reporting PrEP use were more educated, older and more frequently born in a foreign country than non-PrEP users. MSM starting PrEP before and after February 2018 were similar, which may indicate that making PrEP available did not yet reach a more diverse group of MSM.

Key messages:

- MSM reporting PrEP use were more educated, older and more frequently born in a foreign country than non-PrEP users.
- MSM starting PrEP before and after February 2018 were similar, which may indicate that making PrEP available did not yet reach a more diverse group of MSM.

Prevalence of gonorrhea and chlamydia in a community clinic for Men who Have Sex with Men in Portugal

Sofia Ribeiro

S Ribeiro[1,2], *D de Sousa*[3], *D Medina*[2], *R Castro*[4], *A Lopes*[4], *M Rocha*[2]
[1]Department of International Health, CAPHRI, Maastricht University, Maastricht, Netherlands
[2]CheckpointLX, Grupo de Ativistas em Tratamentos, Lisbon, Portugal
[3]Faculty of Medicine, University of Porto, Porto, Portugal
[4]Instituto de Higiene e Medicina Tropical, Universidade NOVA de Lisboa, Lisbon, Portugal
Contact: sofiafigribeiro@gmail.com

Background:

Men who have sex with men (MSM) are at greater risk for sexually transmitted infections (STIs). Data on MSM chlamydia and gonorrhea prevalence estimates and associated risk factors is scarce. To our knowledge, this is the first study to describe the prevalence and the determinants of both chlamydia and gonorrhea infections in MSM in Portugal.

Methods:

We conducted a cross-sectional study using data from 1,832 visits to CheckpointLX, a community-based center for screening blood-borne viruses and other STIs in MSM.

Results:

Overall prevalence of chlamydia or gonorrhea in our sample was 16.05%, with 14.23% coinfection and 40.73% asymptomatic presentation among those testing positive. Anorectal infection was most common for chlamydia (67.26%), followed by urethral (24.78%) and oral (19.47%) infection. Oral infection was most common for gonorrhea (55.63%), followed by anal (51.25%) and urethral (17.50%) infection. In multivariate analyses, young age ($U = 94684$, $p = 0.014$), being foreign-born ($\chi 2 = 11.724$, $p = 0.003$), reporting STI symptoms ($\chi 2 = 5.316$, $p = 0.021$), inhaled drug use ($\chi 2 = 4.278$, $p = 0.039$) and having a higher number of concurrent ($\chi 2 = 18.769$, $p < 0.001$) or total ($\chi 2 = 5.988$, $p = 0.050$) sexual partners were each associated with higher rates of chlamydia or gonorrhea infection.

Conclusions:

Young and migrant MSM are a vulnerable population to STIs, as are those who use inhaled drugs and those with a higher number of concurrent or total sexual partners. Although Portugal has no guidelines on chlamydia and gonorrhea screening, our results point towards a need for greater awareness about the importance of high frequency screening for those at increased risk (i.e. every 3 to 6 months).

Key messages:

- Higher prevalence was found in young and migrant MSM, those with higher number of concurrent or total sexual partners, and those who use inhaled drugs.
- There is a need for greater awareness about the importance of high frequency STI screening for MSM at increased risk.

How to reach migrant transgender women in Paris? An example of collaborative sexual health action

Antoine Deslandes

A Deslandes[1], P Troude[1], E De la Rochebrochard[2,3], C Cabral[4], M Shelly[5], C Segouin[1], P Piron[1]

[1]University Hospital Saint-Louis-Lariboisière-Fernand-Widal, Assistance Publique Hopitaux de Paris, Paris, France

[2]Sexual and Reproductive Health and Right Unit – UR14, Institut National d'Etudes Démographiques (INED), Paris, France

[3]University Paris-Saclay, University Paris-Sud, UVSQ, CESP, INSERM, Villejuif, France

[4]Association PASTT, Paris, France

[5]Association AREMEDIA, Paris, France

Contact: antoine.deslandes@orange.fr

Issue:

In France, screening for HIV and sexually transmitted infections (STIs) is provided by free HIV and STIs screening centers called CeGIDD. Despite a complete combined prevention offer, the number of new HIV diagnosis has been stable for years. Transgender women have one of the highest HIV prevalence.

Description of the problem:

Transgender women are a hard to reach population with multifactorial barriers in their access to healthcare including fear of stigma, leading to late HIV diagnosis and untreated STIs. The CeGIDD of a university hospital in Paris aimed to reach this public working with two associations, creating a free, complete sexual health action outside the hospital in a safe environment.

Results:

The CeGIDD identified a Parisian association, PASTT, which accompanies transgender women, mainly migrants, in accessing healthcare and social rights. Its active file is around 1500 persons a year, mostly resorting to prostitution. Another association, AREMEDIA, pioneer in outreach interventions, was involved. The partnership allowed access to the public and to gather the funds for the intervention. It included counseling, screening, Pre Exposure Prophylaxis (PrEP), and took place once a week in PASTT facilities. Any participant could be referred to other physicians if they needed it, even if they lacked health insurance coverage. From September 2017 to November 2018, 212 persons attended the consultation and 26 received PrEP.

Lessons:

Working together with several associative partners presents many challenges, from the definition of the objectives to operational coordination. Overcoming these difficulties lead us to reach a new public with a high risk for STIs and HIV.

Key messages:

- Community based sexual health actions dedicated to transgender women are a successful way to reach this public.
- The safe environment provided by the association is a great opportunity to familiarize them with the medical staff and to empower them regarding healthcare.

Gender-specific health literacy of individuals with a migrant background: A mixed-method approach

Angela Aldin

A Aldin[1], D Chakraverty[2], A Baumeister[3,4], I Monsef[1], T Jakob[1], ÜS Seven[2], G Anapa[2], E Kalbe[2], C Woopen[3,4], N Skoetz[5]

[4]Cologne Center for Ethics, Rights, Economics, and Social Sciences of Health (CERES), University of Cologne, Cologne, Germany

[5]Department I of Internal Medicine, Cochrane Cancer, Center for Integrated Oncology Aachen Bonn Cologne Duesseldorf, University of Cologne, Medical Faculty and University Hospital of Cologne, Cologne, Germany

Contact: angela.aldin@uk-koeln.de

Background:

The project "Gender-specific health literacy in individuals with a migrant background (GLIM)" (German Federal Ministry of Education and Research; 01GL1723) aims to provide a comprehensive overview of international research and evidence on aspects of gender and migration related to health literacy. It encompasses primary and secondary research using a mixed-methods approach.

Methods:

In a first step, we systematically review the available quantitative and qualitative evidence: in the first quantitative review, we meta-analyse the evidence on gender differences in health literacy of migrants. The second quantitative review assesses the effectiveness of interventions for improving health literacy in female and male migrants. The third review summarises qualitative evidence to assess factors associated with gender and migration that may play a role in the design, delivery, and effectiveness of such interventions. In a second step, we conduct primary research by performing focus group discussions (FGDs) with health care providers who regularly work with different migrant groups in order to explore their perspectives on the challenges and needs of migrants in the German health care system.

Results:
To date, we identified 163 relevant references after screening of 17,932 references, for all reviews combined. Various health literacy interventions and measurement tools exist and require critical evaluation. The FGDs yielded hints to factors that a) influence gender differences in the health literacy of migrants (e.g. masculinity norms preventing Mediterranean men from consulting psychotherapists) or b) limit systemic health literacy (e.g. lack of translators).

Conclusions:
Results from the FGDs can provide insights into the processes underlying the results of the reviews. However, despite increasing research, summarising the available evidence is highly challenging, as there are no universal definitions of the key concepts health literacy and migrant background.

Key messages:

- This is an interdisciplinary project, combining quantitative and qualitative evidence to provide maximum value to health policy and decision-making for the health care and health literacy of migrants.
- Research on gender-, and migration-specific aspects of health literacy is of great importance for the development and delivery of effective interventions for improving migrants' health literacy.

5.G. Cardiovascular risk factors

Identifying patients at risk of readmission for heart failure in the French national claim database

Panayotis Constantinou

P Constantinou[1,2], *N Pelletier-Fleury*[2], *V Olié*[3], *C Gastaldi-Ménager*[1], *Y Juillière*[4], *P Tuppin*[1]
[1]French National Health Insurance, Paris, France
[2]Centre for Research in Epidemiology and Population Health, French National Institute of Health and Medical Research (INSERM U1018), Villejuif, France
[3]Santé Publique France, Saint-Maurice, France
[4]Department of Cardiology, Nancy University Hospital, Vandoeuvre-Les-Nancy, France
Contact: panayotis.constantinou@inserm.fr

Background:
To reduce readmissions for heart failure (HF) among HF patients, most at-risk individuals could be targeted to benefit from adapted interventions. A better understanding of HF readmission predictors could help clinicians and regulators identify patients most at-risk. We focused, in particular, on distinguishing HF severity from overall health-state severity.

Methods:
We studied predictors of HF readmission available in administrative data in a nationwide cohort of patients aged 65 years or older surviving an index hospitalization for HF in 2015 (N = 70 657). To take into account the competing mortality risk, we estimated subdistribution hazard ratios (sdHRs) of HF readmission and cause-specific hazard ratios (csHRs) for HF readmission and for death without HF readmission, over a 1-year follow-up period. We then computed cumulative incidences and daily rates of HF readmission for specific risk-groups.

Results:
31.8% of patients were readmitted at least once for HF, among which 27.2% (8.6% of study cohort) were readmitted 30 days after discharge. 17.6% of patients died without any HF readmission. HF severity and overall health-state severity were the strongest HF readmission predictors (sdHRs 2.66 [95% CI: 2.52-2.81] and 1.37 [1.30-1.45] respectively, when comparing extreme categories). HF severity and length of index stay were more strongly associated with the rate (csHRs) of HF readmissions, whereas overall health-state severity and age were more strongly associated with the competing rate of death without HF readmission. Risk-groups defined upon HF severity and overall health-state severity had approximately 40% of separation in HF readmission proportion (21.9% versus 60.4%).

Conclusions:
Our results stress the importance of considering both HF severity and overall morbidity and of accounting for the competing mortality risk to identify patients at-risk of HF readmission. Such patients could benefit from targeted transitional or post-discharge HF care.

Key messages:

- Heart failure patients can be stratified into risk-groups of readmission using administrative data.
- Identifying at-risk patients could help clinicians and regulators to target interventions.

Role of nurses to improve self-care in heart failure patients: a systematic review and meta-analysis

Azzurra Massimi

A Massimi[1], *C De Vito*[1], *ML Rega*[2,3], *P Villari*[1], *G Damiani*[2,3]
[1]Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy
[2]Università Cattolica del Sacro Cuore, Rome, Italy
[3]Fondazione Policlinico Universitario Agostino Gemelli IRCCS, Rome, Italy
Contact: azzurra.massimi@uniroma1.it

Introduction:
Heart Failure (HF) is a pandemic chronic disease with a prevalence up to 3% in the general population, representing the main cause of hospitalization for people over 65. Self-care plays a central role in the management of patients with HF, showing evidence of effectiveness in reducing re-hospitalization rates and mortality.

Methods:
We carried out a systematic review and meta-analysis to assess the efficacy of nurse-led educational interventions Vs usual care in improving self-care skills of patients with chronic HF. The main biomedical databases were searched for Randomized Control Trials (RCTs) of nurse-led educational interventions performed on adults with a previous diagnosis of HF. Improvement of HF self-management skills (self-care level) was summarized by calculating the standardized mean difference (SMD) and 95% confidence intervals (CI) stratified for the length of the follow-up.

Results:
Globally, 14 RCTs were included involving 2078 participants. Ten studies showed the efficacy of the interventions at 3 months (short term) with a SMD of 0.78 (95% CI 0.38-1.18) in favor of the self-care education interventions. Five studies reported on self-care abilities at 6-9 months (medium term), not showing statistically significant results (SMD 0.35, 95%CI 0.11-0.81). The long-term effect of the educational interventions showed no statistically significant improvement in self-care behaviors (three studies, SMD 0.05, 95CI% 0.12 - 0.22).

Conclusions:
These results show that nursing educational interventions improve self-care behaviors in HF, but mainly in the short term. Intensive educational interventions led by nurses, associated with appropriate continuity and transition of care, can determine the best outcomes for patients with HF, strengthening self-care behaviors over time. This approach could have a major impact not only on individual level, but on the general reduction of complications, hospitalization, medical costs and ultimately mortality.

Key messages:

- Nurse-led educational programs have a short-term efficacy in enhancing self-care behaviors among heart failure patients.

- Post-discharge repeated educational interventions, along with timely and shared plans ruling the transition between the hospital and the other providers, are strongly needed.

Cardiovascular disease risk factors of military: A comparative assessment with civilians

Bienvenu Bongue

W Bell Ngan[1,6], L Essama Eno Belinga[2,3,4], ASP Essam Nlo'O[1], D Lemogoum[2,7], F Roche[6], SH Mandengue[2,5], B Bongue[6,8]

[7]Université Libre de Bruxelles, Brussels, Belgium
[8]Populations et Cycles de Vie, CETAF, St-Etienne, France
Contact: bienvenu.bongue@cetaf.fr

Background:

Cardiovascular diseases are the leading cause of death in the world. Military population that seemed immune to these pathologies is now as exposed as the general population. The effective response to this public health problem first requires the identification of the level of exposure of populations. Thus, the objective of our study was to determine the prevalence of Cardiovascular Disease (CVD) risk factors of the Cameroonian military population compared to civilians.

Methods:

We conducted a cross-sectional study. It involved subjects aged 18 to 58 years, recruited from October 30, 2017 to November 13, 2018 at the Fifth Military Sector Health Center. Five cardiovascular risk factors were assessed, smoking, harmful alcohol consumption, obesity/overweight, hypertension and diabetes. The STEPwise model proposed by the World Health Organization (WHO) was used to estimate the risk of cardiovascular diseases. Mann Whitney and Fisher exact tests were used for statistics comparison.

Results:

The study included 489 subjects, 270 military personnel and 219 civilians. The median age of the two populations was not significantly different (30 years versus 33 years, p = 0.6939). The proportion of smokers was higher in the military (12.59% versus 9%, p = 0.0011). Alcoholism was also higher in the military population (60.74% versus 13.24%, p = 0.0000). Similarly, military personnel were more obese than civilians (58.15% versus 40.18%, p = 0.0000). Distribution of hypertension and diabetes was not significantly different between military and civilians (18.15% versus 16.89%, p = 0.8113) and (1.48% versus 3.20%, p = 0.2321) respectively. The proportion of subjects with a high cardiovascular risk was higher in the military (14.81% versus 7.76%, p = 0.0162).

Conclusions:

CVD risk factors are more prevalent in Cameroonian military population than in civilians. This result suggests that, in addition to national preventive campaigns, special attention is needed for military population in Cameroon.

Key messages:

- Cardiovascular disease risk factors are more prevalent in Cameroonian military population than in general population.
- in addition to national preventive campaigns, special attention is needed for military population in Cameroon.

Cardiovascular hospitalisation before and during the financial crisis among occupations in Taiwan

Yu-Hung Chang

Y Chang[1]
[1]Department of Public Health, China Medical University, North District, Taiwan
Contact: yuhungc@mail.cmu.edu.tw

Background:

Cardiovascular diseases (CVD) were related to financial stress. Little was known about the effects of financial crisis on cardiovascular health by occupations. This study examined CVD hospitalisations before and during the 2008 financial crisis among five occupational groups in Taiwan.

Methods:

Data were collected from the Taiwan Survey on Hypertension, Hyperglycemia and Hyperlipidaemia 2007, including 4,673 participants aged 20 and above, categorized into five types of occupations, i.e., professional & manager (PM), office clerk & administrative staff (OA), skilled work (SW), unskilled worker (UW) and non-worker (NW). We abstracted their CVD hospitalisation records in the three years before (September 2005 to August 2008) and during the 2008 financial crisis (September 2008 to August 2011) from the National Health Insurance Research Database. Using incidence rate ratios (IRRs), we compared CVD hospitalisation of the first, second, third year from September 2008 to the three-year average before September 2008 for five occupational groups. Random effect negative binomial models were performed to estimate IRRs.

Results:

After adjusting for covariates including age, sex, education, smoking, alcohol drinking, exercise and body mass index, there was an increase of CVD hospitalisation incidence for NW in the first year of the financial crisis (IRR = 1.46, 95% Confidence Interval [95% CI] = 1.19-1.77); in the second year, SW had a raised risk of CVD hospitalisation (IRR = 2.71, 95% CI = 1.59-4.60). For all occupational groups, the incidence rates of CVD hospitalisation reached the peak in the third year (PM: IRR = 2.68, 95% CI = 1.05-6.83; OA: IRR = 2.70, 95% CI = 1.18-6.19; SW: IRR = 5.13, 95% CI = 2.89-9.09; UW: IRR = 2.12, 95% CI = 1.02-4.41; NW: IRR = 1.85, 95% CI = 1.18-2.67).

Conclusions:

CVD hospitalisation of all occupations were affected by the financial crisis; when non-workers were the early victims, skilled workers may be the most vulnerable in the 2008 financial crisis.

Key messages:

- This study investigated the effects of the 2008 financial crisis on cardiovascular disease hospitalization by five occupational types in Taiwan.
- All occupations, particularly skilled workers, were affected by the financial crisis.

Socioeconomic Inequalities in Cardiovascular Risk Factors in Turkey, 2008-2016

Erdem Erkoyun

E Erkoyun[1,2], JP Mackenbach[1]
[1]Public Health, Erasmus Medical Center, Rotterdam, Netherlands
[2]Public Health Directorate, Izmir Provincial Health Directorate, Izmir, Turkey
Contact: erdemerkoyun@gmail.com

Background:

This study aims to investigate the magnitude of occupational class (OC) and educational inequalities in cardiovascular risk factors in Turkey from 2008 to 2016.

Methods:

We used the Turkey Health Survey, a bi-annual health interview survey among a representative sample of the Turkish population. We calculated the age-standardized prevalence of four cardiovascular risk factors (obesity, overweight, hypertension, diabetes and smoking) by OC and education, and summarized inequalities with the Relative Index of Inequality (RII) and Slope Index of Inequality (SII). To determine whether the RII/SII changed over time we estimated a regression model with an interaction term between survey year and OC/education.

Results:

We found different patterns for men and women. Among men, smoking was the only risk factor with a higher prevalence in both lower OC and education groups (RII = 1.18 (95% CI: 1.08-1.28) and 1.40 (1.26-1.55), respectively). Obesity, overweight and diabetes was higher among higher OC (e.g., for overweight RII = 0.83, 95% CI 0.76-0.90) whereas obesity was higher among lower educated (RII = 1.32, (95% CI: 1.08-1.61)) and no inequalities were found for hypertension by socioeconomic status. However, among women, all risk factors except smoking had a higher prevalence in lower OC and education groups (e.g., for overweight RII = 1.14 (1.06-1.24) and 2.98 (2.71-3.29), respectively), whereas for smoking we found a higher prevalence in higher socioeconomic groups (RII for OC = 0.77 (95% CI: 0.65-0.90 and for education = 0.36 (0.29-0.44)). Significant interactions with survey year were only found in a few cases, mainly pointing to emergence or widening of inequalities to the disadvantage of lower socioeconomic groups.

Conclusions:

Inequalities in cardiovascular risk factors are less systematic in Turkey than in most high-income countries, but if current trends continue similar inequalities will emerge in the near future.

Key messages:

- In Turkey, in men obesity, overweight and diabetes are concentrated among higher occupational classes, obesity is concentrated among lower education groups and lower socioeconomic groups smoke more.
- In Turkey, in women obesity, overweight, hypertension and diabetes are concentrated among lower socioeconomic groups however higher socioeconomic groups smoke more.

Risk of cardiovascular diseases after breast cancer: an analysis on a cohort of 1.3 million women

Fulvio Ricceri

Contact: fulvio.ricceri@unito.it

Background:

Breast cancer (BC) is the malignant tumor with the highest incidence in women in the world with an estimate of about 500,000 new cases per year in Europe. Guidelines for BC treatment include surgery followed by radiotherapy, hormonal therapy or chemotherapy. Several studies showed that BC treatment increases the risk of myocardial infarction (MI) while only few studies investigated the risk of stroke after BC. The aim of the present study was to assess the risk of MI and stroke in BC survivors, taking into account the possible influence of treatments.

Methods:

Women included in the study are part of a longitudinal cohort including all residents in the Piedmont region linked to the 2011 census data and followed-up through administrative data on mortality, hospital admissions, drug prescriptions, and outpatient consultations. Validated algorithms to identify BC incident cases and their therapies as well as to identify MI and stroke were applied.

The effect of BC on the risk of MI and stroke was tested using Cox models (adjusted for confounding variables) that allow to account for the competing risks. First, BC patients were compared to healthy women, then BC women that undertwent a specific therapy were compared with both healthy women and other BC patients.

Results:

Women with BC showed an increased risk compared to healthy women for both MI (HR: 1.20; 95% CI: 1.05-1.38) and stroke (HR: 1.58; 95%CI: 1.38-1.82). Chemotherapy almost doubled the risk of MI, while radiotherapy did not seem to have a similar effect, even comparing with other BC patients. The high risk of stroke observed comparing BC (any therapy) with healthy women disappeared when comparing specific therapies among BC patients.

Conclusions:

Chemotherapy increased the risk of MI in BC patients, while recent radiotherapy strategies had less impact, if any. Moreover, the mechanism for which BC patients have an increased risk of stroke seems not to be related to a late effect of therapies.

Key messages:

- Breast cancer women are at higher risk of developing cardio and cerebrovascular diseases and this should be taken into account when planning therapies and follow-up surveillance.
- Despite the increase in quality of the therapeutic approaches for breast cancer patients, chemotherapy increases the risk of myocardial infarction, while radiotherapy dangerousness recently decreased.

Long working hours and mortality in Central and Eastern Europe: the HAPIEE study

Hynek Pikhart

H Pikhart[1,2], Q Liu[1], A Pajak[3], S Malyutina[4], R Kubinova[5], M Bobak[1]
[1]IEHC, University College London, London, UK
[2]Recetox, Masaryk University, Brno, Czech Republic
[3]Department of Epidemiology and Population Studies, Jagiellonian University, Krakow, Poland
[4]Institute of Internal and Preventive Medicine, Siberian Branch of the Russian Academy of Medical Sciences, Novosibirsk, Russia
[5]National Institute of Public Health, Prague, Czech Republic
Contact: h.pikhart@ucl.ac.uk

Background:

Long working hours are common in countries of Central and Eastern Europe (CEE). A wide range of epidemiological studies have showed that long working hours had an adverse effect on health but the evidence mostly comes from Western Europe, East Asia and North America. This study aimed to assess the relationship between long working hours and the risk of mortality in employed people in three Eastern European countries.

Methods:

Participants, aged 45-69 years at baseline, were from the Health, Alcohol and Psychosocial Indicators in Eastern Europe (HAPIEE) cohort study conducted in Russia, Poland and the Czech Republic. Baseline survey included a structured questionnaire and examination in the clinic during 2002-2005. Working hours were assessed by a self-reported questionnaire at baseline. Participants have been followed-up for all-cause mortality and cause-specific mortality for an average of 11 years. Impact of long working hours on mortality was analysed by Cox proportional hazards regression. In all-cause mortality analysis, a total of 10878 men and women were included, and 10399 participants were included in cause-specific mortality analysis.

Results:

During the follow-up, there were 1187 deaths from all causes, 288 from CVD, and 251 from cancer. Those who worked 61 hours or more in a week showed higher risk of mortality compared to those working 36-45 hours per week: HR 1.32 (95%CI 1.01 to 1.74) for all-cause mortality and 1.73 (95% CI 1.03-2.93) for CVD mortality. There was no significant increase in risk of cancer mortality associated with working long hours. There was no significant association between working 46-60 hours a week and risk of mortality, including all-cause mortality and cause-specific mortality.

Conclusions:

The risk of all-cause and CVD mortality in three CEE was significantly higher among employees working extensive hours. These findings suggest that more attention should be paid to shortening working hours for those who work extensively.

Key messages:

- Long working hours increase risk of all cause and CVD mortality.

- Cancer mortality is not related to long working hours.

The Role of Niacin in Cardiovascular Disease Prevention: A Systematic Review and Meta-analysis

Elvira D'Andrea

E D'Andrea[1,2], *S Hey*[2], *CL Ramirez*[2], *A Kesselheim*[2]
[1]Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy, Rome, Italy
[2]Program On Regulation, Therapeutics And Law (PORTAL), Division of Pharmacoepidemiology and Pharmacoeconomics, Department of Medicine, Brigham and Women's Hospital and Harvard Medical School, Boston, USA
Contact: elvira.dandrea@gmail.com

Background:

Niacin remains a therapeutic option for patients with cardiovascular disease, but recent studies have called into question the effectiveness of other HDL-C-raising drugs. We evaluated the evidence supporting current FDA-approved uses of niacin in cardiovascular prevention settings.

Methods:

The systematic review included clinical trials involving niacin as a treatment for cardiovascular disease. The meta-analysis included randomized clinical trials reporting niacin's effect on at least one long-term outcome: cardiovascular disease, coronary heart disease mortality, acute coronary syndrome, stroke, revascularization, major adverse cardiac events (MACE). Databases were searched up to October 2017. Study-level data were extracted and inverse-variance weighted methods were used to produce pooled risk ratios using random-effects models for between-study heterogeneity. Meta-regression analysis was used to assess the association between change in HDL-C and the log risk ratio of the pooled results.

Results:

Out of 119 clinical trials, 17 documented niacin's effect on at least one cardiovascular disease outcome. The meta-analysis covered 35,760 patients with history of cardiovascular disease or dyslipidemia. Cumulative evidence found no preventive effect of niacin on cardiovascular outcomes in secondary prevention. Stratified meta-analysis showed an association between niacin monotherapy and reduction of some cardiovascular events (acute coronary events, RR 0.74, 95%CI 0.58-0.96; stroke, RR 0.74, 95%CI 0.59-0.94; revascularization, RR 0.51, 95%CI 0.37-0.72). These results were mainly driven by two trials conducted in the 1970s and 1980s.

Conclusions:

Niacin might have some use in lipid control for secondary prevention as monotherapy, perhaps in patients intolerant to statins, but evidence is from older studies on a population potentially not representative of current-day patients.

Key messages:

- Niacin might have some use for cardiovascular secondary prevention in patients intolerant to statins, but evidence is from older studies on a population not representative of current-day patients.
- The FDA has to review the approved indications for Niacin in cardiovascular secondary prevention.

5.H. Workshop: Transferring innovation in health systems: The role of national mirror groups

Organised by: TO REACH Consortium, EUPHA
Chair persons: Natasha Azzopardi Muscat - EUPHA, Karine Chevreul - France
Contact: natasha.azzopardi-muscat@um.edu.mt

To-Reach has the aim to build and push forward a strategic agenda at European level for health services and policy research into practice in order to help decision makers in identifying and understanding the value of a given innovation in the field, the potential for joint development of innovation and facilitating implementation to fit the regional/local contexts.

Given the diversity of health systems in Europe and the element of subsidiarity within the European Treaty, in order, to achieve this aim the commitment of all categories of stakeholders (funding bodies, researchers, policy makers, systems managers...) at national level is as essential prerequisite for success.

France has created a mirror group to consult these stakeholders to ensure that national priorities will be reflected at European level and respectively that national priorities and funding direction are influenced by the European strategic agenda. The objectives of this workshop will be to learn from the French experience and to discuss how similar experiences in other countries could be shared and promoted. Their role going forward in the project and their contribution to the expected outcomes will be the focus of this workshop. Stakeholders from a number of European countries will be invited to present and discuss their perspective on this issue.

Key messages:

- Joint development of health services research at European level is necessary to overcome key system challenges.
- National stakeholders are key to the development of a European health services research progarmme.

The need for a transformation health systems research programme in Europe

Walter Ricciardi

W Ricciardi
Contact: walter.ricciardi@unicatt.it

Over the last decades, European health systems have faced growing common challenges: ageing related issues and continuous financial pressures call for innovative solutions on how to organise health care in an equitable and efficient manner. To address this situation there is an urgent need to bring in innovation and research evidence, in order to identify and implement more effective and sustainable ways to organise, manage, finance, and deliver high quality care to all European citizens. TO-REACH has been working to develop a Strategic Research Agenda which has the ambition to address the increasing challenges faced by health systems, directed to those policy areas relevant in the coming years. This living document will help preparing an European research programme that will maximise value of research public investment in this field by helping avoid duplication and failed implementation while ensuring systematic prioritisation of research areas that face greatest changes and highest need.

Learning between European health systems: the nature of the challenge

Nick Fahy

N Fahy
Contact: nicholas.fahy@phc.ox.ac.uk

Given their shared values and challenges, European health systems should be able to learn from each other about what works best. In practice, though, turning good practice in one place into more universal practice is stubbornly difficult even within single health systems, and has proved particularly challenging between European health systems. This session will explore the nature of the challenge to implementing innovation; the nature of what implementing innovation involves, why it proves to be so challenging in practice, and the particular challenges of learning between countries, and outline what can be done in research, policy and practice to help learning across European health systems more effectively in future.

The achievements of the ToREACH project and next steps

Sabrina Montante

S Montante
Contact: sabrina.montante@iss.it

Putting in practice the Strategic Research Agenda of TO REACH within a European platform for learning and collaboration requires the engagement with a wide range of stakeholders both at national and European level. The TO-REACH project is itself a first step towards establishing such a partnership and cooperation approach, involving policy-makers, funders, researchers and other stakeholders from across the European Union. A shared European approach to health services and policy research will contribute to addressing the challenges described in the previous presentations by putting in place the governance and framework conditions needed to support the necessary research across the region and beyond.

5.I. Skills building seminar: How to improve vaccination coverage in the European Union?

Organised by: EC, Observatory
Chair persons: Josep Figueras - European Observatory, Isabel de La Mata - European Commission - DG Sante
Contact: bernd.rechel@lshtm.ac.uk

In recent years, the European Union (EU) has been facing several serious outbreaks of vaccine-preventable diseases, including measles. Vaccination coverage rates for the first dose of the vaccine against measles vary from 85% in Italy to 99% in Luxembourg and Hungary, with the average for the EU (93.6%) falling below what is required to ensure herd immunity. Similar variations can be seen for other vaccinations, including influenza immunization programmes targeting older adults who are at greater risk of severe complications. Of particular concern is that in a number of EU countries anti-vaccine groups, aided by social and mainstream media, and sometimes populist politicians, are gaining traction and have started to influence public and health worker attitudes towards the safety and effectiveness of vaccinations.

The EU has started to respond to these developments in a number of ways. In his 2017 State of the Union address, Jean-Claude Juncker, the President of the European Commission, has called for action to increase vaccination coverage and to ensure that everyone in the EU has access to vaccines. This was followed by a number of new policy and research activities initiated by the European Commission.

The workshop provides an overview of some of these activities. It starts with an introductory presentation on recent initiatives of the European Commission to support national vaccination efforts. This is followed by a presentation on the work of the Expert Panel on effective ways of investing in Health and their report on vaccination programmes and health systems in EU countries. A third presentation presents EU-funded research on vaccine hesitancy in EU member states, based on the largest ever study on attitudes to vaccines and vaccination in the EU. A final presentation explores a study undertaken for the European Commission by the European Observatory on Health Systems and Policies on the organization and delivery of vaccination programmes in EU member states, based on detailed country fiches.

The workshop will provide opportunity for the audience to comment on and discuss presentations and to consider current policy options in Europe to address vaccine hesitancy and improve vaccination coverage through health system interventions. It will be of interest to public health researchers, practitioners and policy-makers from across Europe.

Key messages:

- The workshop provides a forum for discussing European initiatives to overcome vaccine hesitancy and improve vaccination coverage.
- It explores policy options at the European and national level.

Recent European Union (EU) initiatives to support national vaccination efforts

Isabel de La Mata

I de La Mata[1]
[1]European Commission, Brussels, Belgium
Contact: Isabel.DELAMATA@ec.europa.eu

Background:

Vaccination is the main tool for primary prevention of disease and one of the most cost-effective public health measures available. Immunisation through vaccination is the best defence we have against serious, preventable, and sometimes deadly, contagious diseases. Thanks to widespread vaccination, smallpox has been eradicated, Europe made polio-free, and many other diseases almost eliminated.

Methods:

This presentation provides an overview of recent European Union (EU) initiatives to support national vaccination efforts.

Results:

The EU has launched a number of initiatives to strengthen national vaccination efforts. In December 2018 the European Council adopted a Recommendation to strengthen the EU cooperation on vaccine-preventable diseases. The initiative aims to tackle vaccine hesitancy, improve coordination on vaccine procurement, support research and innovation, and strengthen EU cooperation on vaccine-preventable diseases. EU countries are encouraged to develop and implement national vaccination plans with initiatives to improve coverage, and to introduce routine vaccination status checks.

The European Commission is also reinforcing its support to national vaccination efforts to increase coverage, including through the preparation of a Joint Action on vaccination co-funded by the Health Programme. Launching in 2018, the Joint Action will address vaccine hesitancy and seek to increase vaccination coverage in the EU. It is coordinated by INSERM (France) and involves 23 countries (among them 20 EU countries).

Conclusions:

Vaccination policy is a competence of national authorities, but the European Commission assists EU countries in coordinating their policies and programmes.

Vaccination programmes and health systems in the European Union. Report of the Expert Panel on effective ways of investing in Health

Martin McKee

M McKee[1], *L Siziliani*[1], *C Wild*[1], *D Kringos*[1], *MM Barry*[1], *P Barros*[1], *J De Maeseneer*[1], *L Murauskiene*[1], *W Ricciardi*[1]
[1]Expert Panel on effective ways of investing in Health, European Commission, Brussels, Belgium
Contact: Martin.McKee@lshtm.ac.uk

Background:

Vaccination is one of the most cost-effective public health interventions available and the main tool for primary prevention of communicable diseases. However, the EU is facing increasing outbreaks of vaccine preventable diseases, while some fatal cases of measles and diphtheria have been reported.

Methods:

The presented report is based on the work of the Expert Panel on effective ways of investing in Health, which was informed by a literature review on the main factors (enablers and obstacles) influencing vaccination uptake.

Results:

Obstacles to vaccination coverage include individuals' and parents' concerns or fears about vaccine safety and side effects, lack of trust, social norms, exposure to rumours and myths undermining confidence in vaccines, failure by some healthcare providers to counter these myths and provide evidence-informed advice, access barriers (e.g. poor availability, co-payments), and failure to understand the underlying mechanisms that decrease vaccination confidence. Enablers include sources of reliable information about vaccination, exposure to positive media messages, building trust in institutions and providers, building confidence in vaccination, easy access and availability to healthcare services, ease of administration, active involvement and engagement by healthcare providers, and targeting of high-risk groups.

Conclusions:

There is a range of policy options that countries can implement to increase vaccination coverage. Communication strategies about the benefits of vaccination are important but need to be combined with opportunities for dialogue with vaccine hesitant groups and participatory approaches. These strategies need to be targeted not only at the uninformed (i.e. the lack of information) but also at the misinformed (when the information is incorrect) or disinformed (when information is spread with the intention to deceive).

State of vaccine confidence in the European Union in 2018

Emilie Karafillakis

H Larson[1], A de Figueiredo[1], E Karafllakis[1], M Rawal[1]
[1]Vaccine Confidence Project, LSHTM and Imperial College, London, UK
Contact: Emilie.Karafillakis@lshtm.ac.uk

Background:

High confidence in vaccination programmes is crucial for maintaining high coverage rates. Across the European Union (EU), however, vaccine delays and refusals are contributing to declining immunisation rates in a number of countries and are leading to increases in disease outbreaks.

Methods:

We assessed the overall state of confidence in vaccines among the public in all 28 EU member states and among general practitioners (GP) in ten EU member states, conducting the largest ever study on attitudes to vaccines and vaccination in the EU, eliciting the views of approximately 28,000 respondents across the 28 EU member states.

Results:

We found that a number of member states (including France, Greece, Italy, and Slovenia) have become more confident in the safety of vaccines since 2015, but that the Czech Republic, Finland, Poland, and Sweden have become less confident. While GPs generally hold higher levels of vaccine confidence than the public, the survey found that 36% of GPs surveyed in Czech Republic and 25% in Slovakia do not agree that the MMR vaccine is safe and 29% and 19% respectively do not believe it is important. Countries whose GPs hold higher confidence in vaccines tend to have a larger proportion of the public expressing positive vaccination beliefs.

Conclusions:

Even countries with well-established vaccination programmes and high levels of confidence are not immune to rising vaccine hesitancy. There is a need for continuous monitoring, preparedness and response plans to maintain and increase confidence in the importance, effectiveness and safety of vaccines, among both the public and health professionals.

The organization and delivery of vaccination services in the European Union

Bernd Rechel

B Rechel[1], J Priaulx[2], E Richardson[1], M McKee[2]
[1]European Observatory on Health Systems and Policies, LSHTM, London, UK
[2] Centre for Global Chronic Conditions, LSHTM, London, UK
Contact: Bernd.Rechel@lshtm.ac.uk

Background:

The design and operation of health systems can influence vaccine uptake, including through the way that vaccination programmes are governed, financed and delivered. This study examined the organization and delivery of vaccination programmes in the 28 EU member states and key barriers and facilitators to improved vaccination coverage.

Methods:

We undertook an umbrella review of systematic reviews on health system related factors influencing vaccine uptake and commissioned country fiches that describe the organization and delivery of vaccination programmes in each of the EU member states, followed by a comparative analysis. The focus was on measles vaccination for children and seasonal influenza vaccination for adults.

Results:

In all countries covered, there is a dedicated agency in charge of developing and overseeing implementation of national vaccination plans and programmes. In 9 EU member states (Bulgaria, Croatia, Czech Republic, France, Hungary, Italy, Poland, Slovakia and Slovenia), vaccinations against measles are mandatory for children, while in the remaining 19 countries they are voluntary, but recommended by the relevant authorities. However, the distinction between voluntary and mandatory immunization is not always clear-cut. In contrast, vaccinations for adults against influenza are voluntary in almost all EU member states, with the exception of Slovakia. Vaccinations are provided in most countries through primary care physicians or nurses.

Conclusions:

There are many actions that health systems can take to improve vaccination coverage. These include a mix of incentives and sanctions, targeted measures and outreach services for vulnerable population groups, and an expansion of public financing for vaccinations against influenza, as well as the removal of administrative barriers.

Vaccination coverage in the European Union

Lucia Pastore Celentano

L Pastore Celentano[1]
[1]Vaccine-Preventable Diseases Programme, ECDC, Stockholm, Sweden
Contact: Lucia.Pastore.Celentano@ecdc.europa.eu

Background:

Vaccination coverage rates in the European Union (EU) vary considerably across countries and there has been a decline for some diseases in some countries in recent years.

Methods:

The ECDC supports member states in their vaccination programmes through a range of activities, including identification of threats, surveillance, international collaboration, scientific working groups, assessments of national vaccination programmes, and communication activities.

Results:

For the first dose of the vaccine against measles, coverage ranges from 85% in Italy to 99% in Luxembourg and Hungary, with the average for the EU (93.6%) falling below what is required to ensure herd immunity. Uptake of the second dose against measles reached the target of 95% in only four countries in 2017, compared to 14 in 2007.

Conclusions:

Despite the fact that there are safe and efficient vaccines, there seems to be a crisis of confidence in them. Each EU citizen should receive correct evidence-based information on vaccines and have the same immunisation opportunities.

5.K. Skills building seminar: Measuring children mental health

Organised by: EUPHA (PMH)
Chair persons: Viviane Kovess-Masfety - France, Kerry Keyes - USA
Contact: VKovess@gmail.com

This workshop will be a skills building seminar aimed to present different instruments that have been used in measuring children or adolescents mental health, plus some results to illustrate their pertinence.

It aims to render child psychiatric epidemiology accessible by presenting easy to use instruments for children and adolescents that allow to conduct surveys in schools or in other contexts. It will also present and discuss some results in order to stimulate the epidemiological approaches for child mental health problems as well as evaluating access to care,specialized and no specialized, and the relationships between school achievements and mental health problems.

This will be based on two major studies:

1. The School Children Mental Health Europe, an EU funded project designed to set up a kit of instruments enabling cross EU comparisons. For this project a literature review allows to select the SDQ (Strengths and Difficulties questionnaire) to be administered to the parents and teachers and the Dominic Interactive, a sort of video game designed to evaluate DSM more commune diagnoses since the children were primary school children 6 to 11 years old.
2. Previously done in France, the project has collected around 1000 children per country in Germany, Italy, Netherlands, Lithuania, Bulgaria, Romania and Turkey. In addition it measured parental attitudes, domestic accidents, some physical diseases, parental mental health, access to care for mental health problems and some socio demographics. Teachers are asked to evaluate school achievements in addition to their own child mental health evaluation.
3. The project allows evaluating relative concordance on the above instruments results with clinical judgments on separate clinical samples from each of the countries using the DAWBA (a clinical instrument).
4. The lecture proposes to present the instruments and their usage and some of the comparative results among them the relationships between academic performances and mental health problems.
5. The US National Comorbidity Survey Adolescent Supplement ($N = 6256$), in that survey the Composite International Diagnostic Interview (CIDI) assessed fifteen lifetime mental disorders and The Sheehan disability scale assessed disorder severity. ID was defined as: 1) $IQ \leq 76$, measured using the Kaufman Brief Intelligence Test; and 2) an adaptive behavior score ≤ 76, measured using a validated scale.

The lecture will present the instruments and some of the results concerning psychiatric comorbidity and intellectual disability.

Key messages:

- Children mental health problems are affecting around 12% of the children and should be evaluated and monitored.
- Easy to use instruments exist; as children could be surveyed in schools it becomes relatively easy and not too costly to conduct surveys that will integrate risk factors and access to care.

Comparing children mental health across countries: challenges and results

Viviane Kovess-Masfety

V Kovess-Masfety[1,2]
[1]Metis, EHESP, Paris, France
[2]EA4057, Paris Descartes, Paris, France
Contact: vkovess@gmail.com

Background:

The School Children Mental Health Europe was a EU funded project designed to set up a kit of instruments enabling cross EU comparisons.

Methods:

A literature review allows to select the SDQ (Strengths and Difficulties questionnaire) to be administered to the parents and teachers after a validation process in each country and the Dominic Interactive (DI), a sort of video game designed to evaluate DSM more commune diagnoses on children 6 to 11 years old.

Results:

Data were collected on 7682 children randomly selected in a two stages selection: schools by country and children within the schools for whom 1) either parent- or teacher SDQ were completed: Overall, 12.8 % of children have any probable disorder with significant inter-country differences, 8.4 % probable conduct disorder, and 2.0 % probable hyperactivity/inattention. Adjusting for socio-demographic variables and parental psychological distress, country of residence did not predict the odds of having any disorder. 2) Overall, 22.0% of children were identified per their own evaluation as having at least one mental disorder, ranging from 16.4% in the Netherlands to 27.9% in Bulgaria. The prevalence of internalizing disorders was 18.4% across countries and ranged from 11.8% in the Netherlands to 24.3% in Turkey. The prevalence of externalizing disorders was lower with an average of 7.8%, ranging from 3.5% in Turkey to 10.5% in Bulgaria. Combining samples across European countries, 1 in 5 children reported internalizing problems and 1 in 12 children externalizing problems.

Conclusions:

This lecture aims to present and discuss child mental health measure instruments from different informants perspectives, comparisons across countries and the challenges for interpreting the differences.

Academic performance in mathematics and reading and self-reported mental health problems in children across Europe

Mathilde Husky

M Husky[1]

Psychiatric comorbidity and intellectual disability

Kerry Keyes

K Keyes[1]
[1]Mailman School of Public Health, Columbia University, New York, USA
Contact: kmk2104@cumc.columbia.edu

Most research on the prevalence, distribution, and psychiatric comorbidity of intellectual disability (ID) relies on clinical samples, limiting the generalizability and utility of ID assessment in a legal context. This study assessed ID prevalence in a population-representative sample of U.S. adolescents, and examined associations of ID with socio-demographic factors and mental disorders. Data were drawn from the National Comorbidity Survey Adolescent Supplement (N = 6256). ID was defined as: 1) IQ ≤ 76, measured using the Kaufman Brief Intelligence Test; and 2) an adaptive behavior score ≤76, measured using a validated scale. The Composite International Diagnostic Interview assessed fifteen lifetime mental disorders. The Sheehan disability scale assessed disorder severity. We used logistic regression models to estimate differences in lifetime disorders for adolescents with and without ID. ID prevalence was 3.2%, and was more common among those with specific phobia (OR = 1.66, 95% C.I. 1.02, 2.68), bipolar disorder (OR = 7.24, 95% C.I. 2.10-24.99), after adjusted for demographic and clinical covariates. Among those with Axis I psychiatric disorder, adolescents with ID and mental disorders were significantly more likely to exhibit severe impairment than those without ID, across a broad range of disorders. These findings highlight how sample selection and overlap between ID and psychopathology symptoms might bias understanding of the mental health consequences of ID. For example, associations between ID and behavior disorders widely reported in clinical samples were not observed in a population-representative sample after adjustment for socio-demographic confounders. Valid assessment and understanding of these constructs may prove influential in the legal system by influencing treatment referrals and capital punishment decisions.

5.L. Risk factors for cancer

Smokeless tobacco and waterpie use and risk of lunbg cancer

Priyamvada Paudyal

P Paudyal[1]*, A Memon*[1]*, I Rogers*[1]
[1]Brighton and Sussex Medical School, Brighton, UK
Contact: p.paudyal@bsms.ac.uk

Background:

Over 300 million people worldwide use smokeless tobacco (ST) with rates of use exceeding that of cigarette smoking in much of South-East Asia and amongst certain groups in the Middle East. This study investigated the association between consumption of ST use and waterpipe smoking and lung cancer risk.

Methods:

A systematic review and meta-analysis was carried out to summarise the findings from the epidemiologic studies of the risk of lung cancer associated with ST use and waterpipe smoking. Search was carried out in MEDLINE, Embase, Web of Science and OpenSIGLE to identify studies published before 18th October 2018. A combination of MESH terms and keywords were used including lung cancer, smokeless tobacco, snuff, snus, betel quid, gutka, naswar, zarda, shisha. Only studies adjusted for cigarette smoking or conducted in non-smokers only were included in the analysis. Random effects meta-analysis was carried out to pool the risk estimates and subgroup analyses was carried out by tobacco type and in studies of non-smokers.

Results:

The search yielded 1796 articles, of which 24 studies (19 studies of ST, four of waterpipes and one of both) including 6777 lung cancer patients were included in the meta-analysis. Lung cancer was found to be positively associated with waterpipe smoking (pooled OR 3·06 (95%CI 1·68 – 5·60) and betel quid tobacco chewing (pooled OR 1·77 (95%CI 1·06 – 2·95)). Among non-smokers, any type of ST use was associated with lung cancer (pooled OR 1·46 (95%CI 1·04 – 2·07).

Conclusions:

Our study suggest positive associations between ST use and waterpipe smoking and lung cancer risk. Given the high prevalence of ST use in much of the developing world, public health policies and international tobacco control efforts should focus on aiming to reduce ST use in addition to cigarette smoking.

Key messages:

- The risk of lung cancer is approximately three times higher in waterpipe smokers than in non-smokers.
- International tobacco control efforts should focus on aiming to reduce smokeless tobacco use in addition to cigarette smoking.

Mapping variation in breast cancer screening: Where to intervene?

Cindy Padilla

Contact: cindy.padilla@ehesp.fr

Introduction:

Mammography screening can reduce breast cancer mortality among women aged 50 years and older. Small geographic areas with lower breast cancer screening uptake may reflect gaps in screening efforts. Our objective was to identify the geographic variations of breast cancer screening uptake among women aged 50-74 years in the Lyon Metropole area, France.

Methods:

We used spatial regression models within a generalized additive framework to determine the clusters of census blocks with significantly lower risk of breast cancer screening uptake. Census block-level data on breast cancer screening participation rates were calculated for women aged 50-74 years who did a mammography between 2015-2016 after being invited with a letter by the cancer screening organization. Using smoothed risk maps adjusting for covariates, we estimated the impact of the spatial distribution of deprivation index, part of opportunistic screening on breast cancer screening participation.

Results:

Between 2015 and 2016, the participation rate of organized breast cancer screening was 49.9%. As hypothesized, women living in highly deprived census blocks had lower participation rates compared to less deprived. However, women living in rural areas with fewer certified mammography services than in urban areas had the highest participation rate. Spatial analyses identified four clusters, one located in an urban area and three in suburban areas.

Conclusions:

Our analysis indicates that depending on the location of the cluster, the influence came from different variables. Knowing the impact of site-specific risk factors is important for implementing an appropriate prevention intervention.

Key messages:

- Spatial analysis for cancer screening can help to improve health initiatives.
- This study contributes to a better understanding of the cluster-specific factors that explain geographic disparities.

Clinical and policy contexts for cancer care: Evidence from Denmark, Ireland and Ontario (Canada)

Maureen Seguin

M Morris[1], *S Landon*[1], *M McKee*[1], *E Nolte*[1]
[1]Department of Health Services Research and Policy, LSHTM, London, UK
Contact: maureen.seguin@lshtm.ac.uk

Background:

We know there are large differences in cancer survival between countries. We know much less about why they exist and persist. In the International Cancer Benchmarking Partnership, we are seeking to understand the influences on patient journey in different countries. In this study we explore how health system factors impact on cancer care in Denmark, Ireland, and Ontario (Canada) to identify common themes, national specificities, and messages for other health care providers.

Methods:

We systematically analysed (i) cancer policy and strategy documents from the three jurisdictions, published between 1995-2014 (n = 20) and (ii) interviews with key informants representing government, health services providers, professional bodies and patient organisations (n = 25). We thematically analysed both datasets using NVivo.

Results:

Five themes emerged from the document review and were confirmed by interview: governance, quality assurance, service delivery, infrastructure and workforce. All three jurisdictions introduced a designated organisation to lead, monitor and, in Ontario, fund cancer services. Reducing wait times was prioritized, with the expansion of diagnostic capacity from the 2000s, for example. Concentrating services into fewer specialist centres was widely viewed as crucial for improving survival for some cancers. Yet policy intent was not always successfully realised on the ground, with lack of sustained investment, organisational barriers or logistical challenges impeding implementation. Jurisdictions face particular challenges maintaining and upgrading infrastructure and equipment, and recruiting and retaining critical staff, specifically in radiology and primary care.

Conclusions:

Cancer care is complex and understanding the interrelationships between factors acting at different levels of the health system is important to improve outcomes. Continued investment in infrastructure and people will be essential.

Key messages:

- Countries face common challenges in creating health systems that optimise cancer outcomes.
- Sustained investment in equipment and human resources will be critical to optimise cancer care and survival.

The positive effect of workplace accommodations on employment five years after a cancer diagnosis

Caroline Alleaume

C Alleaume[1], *A Paraponaris*[2], *M-K Bendiane*[1], *P Peretti-Watel*[3], *A-D Bouhnik*[1]
[1]SESSTIM, Aix-Marseille University, INSERM, IRD, Marseille, France
[2]AMSE, Aix-Marseille University, Marseille, France
[3]VITROME, Aix-Marseille University,IRD, AP-HM, SSA, IHU-Méditerranée Infection, ORS PACA, Marseille, France
Contact: caroline.alleaume@inserm.fr

Background:

Each year, almost 400,000 new individuals are diagnosed with cancer in France and nearly half of them are in the working age. The disease was found to have a negative impact on professional life, especially for the most vulnerable cancer survivors. Literature reviews have pointed out the lack of studies focusing on the evaluation of interventions. In France, workstation layouts are recommended by the French law, but not mandatory to facilitate return to work. The aim of this study was to explore the effect of having a workstation layout after a cancer diagnosis on maintenance in employment five years after diagnosis.

Methods:

We used the French VICAN survey carried out in 2015/2016 on living conditions five years after a cancer diagnosis. Using propensity score matching, we matched two subsamples (with and without workstation layout) to investigate the effect of workstation layout taking into account the characteristics associated with the access to these arrangements.

Results:

Among the 1,514 individuals aged between 18 and 54 at diagnosis and employed in a salaried job at this time, three in five (61.2%) had a workstation layout within the five years following the diagnosis: 35.5% had a position type layout, 41.5% had a schedule layout, and 49.2% had a working time layout. Among those who had a workstation layout, 89.7% were still in employment five years after diagnosis against only 77.8% of those who did not so (p.value<0,001). After matching, having a workstation layout increased maintenance in employment from 77.8% to 95.0% (Average workstation layout effect on the treated of 0.172, 95% CI = [0.114; 0.229]).

Conclusions:

Having a workstation layout after a cancer diagnosis strongly increases maintenance in employment of five years cancer survivors. More research is needed to better understand the differences in access to these arrangements and the related selection effect.

Key messages:

- Workstation layout increases maintenance in employment of survivors five years after a cancer diagnosis. Therefore, it should be used more systematically to facilitate work with a chronic disease.
- Having a workstation layout may constitute a disadvantageous selection bias for more vulnerable workers. It can also lead to discrimination feelings.

5.M. Nutrition and food safety

Children's food intake in relation to preschool-level facilitators and barriers of healthy nutrition

Reetta Lehto

R Lehto[1,2], *C Ray*[1], *H Vepsäläinen*[2], *L Korkalo*[2], *K Nissinen*[3], *L Koivusilta*[4], *E Roos*[1], *M Erkkola*[2]
[1]Folkhälsan Research Center, Helsinki, Finland
[2]Department of Food and Nutrition, University of Helsinki, Helsinki, Finland
[3]School of Food and Agriculture, Seinäjoki University of Applied Sciences, Seinäjoki, Finland
[4]Department of Social Research, University of Turku, Turku, Finland
Contact: reetta.lehto@folkhalsan.fi

Background:

Childcare is an important setting for young children's food consumption as, in Finland, most children eat three meals a day in childcare. Thus, it is important to recognize determinants of children's dietary intake in childcare. The aim of this study was to examine food-related factors at preschool and manager-level and their association with children's fruit, vegetable and fibre intake at preschool.

Methods:

The study was a part of the cross-sectional DAGIS survey conducted in 2015-2016. It aimed to examine 3-6-year-old preschoolers' energy balance-related behaviors in Finland. Preschool managers from 58 preschools filled in a questionnaire on food and nutrition related factors at preschool such as kitchen type, food policies, food education, the manager's possibilities to impact fruit and vegetable supply and cooperation challenges with the catering service. Preschool personnel kept food record for the children (n = 585) on two preschool days. Multilevel linear and logistic regression analyses were conducted with age, gender and municipality as confounders, preschool-level factors as independent variables and children's vegetable (g/day) and fruit (yes vs. no) consumption, and fibre intake (g/MJ) as outcome variables.

Results:

Having many written food policies in the preschool was associated with higher intake of vegetables (p = 0.01) and fibre (p = 0.03) among the children. Having at least 2 out of 3 different cooperation challenges with the catering service was associated with higher intake of fibre (0.03) and lower odds of eating fruits (p = 0.01).

Conclusions:

Written food policies and manager-reported challenges with the catering service were associated with children's vegetable, fruit and fiber intake at preschool. Factors that are relatively distal from the meal situations may impact children's food intake at preschool and should be taken into account when promoting healthy food intake at preschool, but more studies are needed.

Key messages:

- Written food policies and good cooperation between the preschool and catering services may be of benefit to children's healthy food intake at preschool.
- The relation between preschool and manager-level factors and children's food intake are very little studied, and thus more studies are needed before conclusions can be made.

How does education affect diet in women? A comparison between Central and Southern Europe cohorts

Antonella Agodi

A Agodi[1,2], *A Maugeri*[1], *R Magnano San Lio*[1], *G Favara*[1], *M Vinciguerra*[3], *M Barchitta*[1]
[1]University of Catania, Catania, Italy
[2]AOU Policlinico-Vittorio Emanuele, Catania, Italy
[3]International Clinical Research Center, St Anne's University Hospital, Brno, Czech Republic
Contact: agodia@unict.it

Background:

Comparisons among European populations is useful to identify opportunities for planning nutrition strategies to reduce social inequalities in health. Our study aims to identify dietary patterns in adult women and to evaluate their association with educational level in Czech Republic and Italy, which display different health inequalities.

Methods:

We performed a cross-sectional analysis of women (aged 25-64 years) with no history of severe diseases, who have been recruited in Brno (Czech Republic; n = 957) and in Catania (Italy; n = 841). Dietary patterns were derived by Food Frequency Questionnaire and Principal Component Analysis. We tested the association between educational level (low vs. high) and adherence to dietary patterns. Logistic regression models were used to assess Odds ratio (OR) and 95% confidence interval (CI), after adjusting for age, employment status, marital status, smoking status, parity, BMI, and menopause.

Results:

In both cohorts, we identified the healthy and the unhealthy dietary patterns. We observed that women with high adherence to the healthy dietary pattern were less educated in Czech Republic, and more educated in Italy. After adjusting for covariates, low educational level was positively associated with adherence to the healthy dietary pattern among Czech women (OR = 2.033; 95%CI = 1.301-3.176; p = 0.002), and negatively associated among Italian women (OR = 0.166; 95%CI = 0.029-0.952; p = 0.044). No association was identified between educational level and the unhealthy dietary pattern.

Conclusions:

In the Italian cohort, findings were consistent with the notion that healthy dietary choices are less common among low-educated groups. By contrast, in newly developed countries such as the Czech Republic, the ''nutrition transition'' from traditional staples to western foods might be more common in highly-educated groups, probably due to the advocacy of Western culture through mass media and commercial marketing.

Key messages:

- Low educational level has an opposite effect on healthy diet, exhibiting a positive association in Czech women, and a negative association in Italian women.
- From a broader perspective, the observed effect of education on diet quality helps explain social health inequalities in Central and Southern Europe.

Impact of Danish ban of industrial produced trans fatty acids on serum cholesterol levels 1993-2006

Kirsten Schroll Bjørnsbo

K Bjornsboe[1], *MU Jakobsen*[2], *A Bysted*[2], *S Fagt*[2], *T Christensen*[2], *T Joergensen*[1]
[1]Center for Clinical Research and Prevention, Bispebjerg and Frederiksberg Hospital, Frederiksberg, Denmark
[2]The National Food Institute, DTU, Lyngby, Denmark
Contact: kirsten.bjoernsbo@regionh.dk

Industrially produced trans fatty acids (ITFA) increase the LDL:HDL ratio and hereby the risk of cardiovascular disease (CVD). Therefore, ITFA has been reduced in Western Europe over the last decades but is still high in Eastern Europe and in subgroups of the EU population. Regulatory interventions are the only way to minimize ITFA intake for all. The Danish ITFA ban (2004) can elucidate the impact of elimination of ITFA on CVD. In Denmark cardiac mortality declined by 70% through 1980-2009. Data on ITFA intake and blood lipids from the 1990s, where the average Danish ITFA intake was about 3 g/d, and up to today are needed to study the correlation between intake of ITFA and serum cholesterol (CHOL). The Danish food composition databank has been updated with TFA intake values. Hereby the correlation between ITFA intake and CHOL level in Denmark from 1993 -2006 can be investigated.

Methods:

Ecological analyses of ITFA and CHOL in participants from 3 cohorts:

- Diet, Cancer and Health (1993-1997); n = 57,054; 50-64 yr
- Inter99 (1999-2001); n = 6,784, 30-60 yr
- Health 2006 (2006); n = 3,471, 18-69 yr

Results:

ITFA-intake was 0.02 g/d in Inter99. Data will be extended to include ITFA intake data of all cohorts as well as age adjusted correlations with CHOL.

Mean CHOL all men (n = 31,675) declined from 6.3 ± 1.0 in 1993 to 5.4± 1.0 in 2006

Mean CHOL all women (n = 34,675) declined from 6.6 ± 1.5 in 1993 to 5.4± 1.1 in 2006

Similar declines were found in participants without self-reported hypercholesterolemia:

Mean CHOL men (n = 28,999) declined from 6.1 ± 0.9 in 1993 to 5.1± 1.0 in 2006

Mean CHOL women (n = 32,593) declined from 6.5 ± 1.5 in 1993 to 5.2± 1.1 in 2006

There was a significant decrease in CHOL ($p < 0.0001$) from 1993, where average Danish intake of ITFA was about 3 g/d to 2006 where ITFA was banned

Conclusions:

Data show a non-treatment related significant decline in CHOL. Data from 2000 and 2006 are collected in younger populations, which may explain lower CHOL levels.

Key messages:

- Cholesterol decline significantly in Danish participants simultaneously with ITFA elimination.
- Results are important for decision makers in countries which consider ITFA regulation.

Ultra-processed food intake and risk of type 2 diabetes in a French cohort of middle-aged adults

Bernard Srour

B Srour[1]*, LK Fezeu*[1]*, E Kesse-Guyot*[1]*, B Allès*[1]*, E Chazelas*[1]*, M Deschasaux*[1]*, S Hercberg*[1,2]*, CA Monteiro*[3]*, C Julia*[1,2]*, M Touvier*[1]
[1]Inserm, Nutritional Epidemiology Research Team (EREN), INSERM, University of Paris 13, Bobigny, France
[2]APHP, Public Health Department, Avicenne Hospital APHP, Bobigny, France
[3]Department of Nutrition and Public Health, University of Sao Paulo, Sao Paulo, Brazil
Contact: b.srour@eren.smbh.univ-paris13.fr

Objective:

The consumption of ultra-processed foods has been increasing during the last decades, and has been previously associated with increased risks of mortality and several chronic diseases. The objective of this study is to assess for the first time the prospective associations between consumption of ultra-processed foods and the risk of type 2 diabetes (T2D).

Methods:

104707 participants aged at least 18 years (median age 41.5 years) from the French NutriNet-Santé cohort (2009-2019). Dietary intakes were collected using repeated 24 hour dietary records, designed to register participants' usual consumption for 3300 different food items, categorized according to their degree of processing by the NOVA classification. Associations between ultra-processed food intake and risk of T2D were assessed using multi-adjusted Cox proportional hazard models.

Results:

Ultra-processed sugary products, fruits and vegetables, and beverages were the highest contributors of the ultra-processed category (respectively 27.9, 18.5 and 15.6%). Ultra-processed food intake was associated with a higher risk of T2D (n = 821 incident cases; hazard ratio for an absolute increment of 10 in the percentage of ultra-processed foods in the diet = 1.15 (1.06-1.25); P = 0.0009, 582252 person-years). These results remained statistically significant after adjustment for other metabolic comorbidities, for several markers of the nutritional quality of the diet (red meat and sugary drinks consumption, intakes of saturated fatty acids, sodium, sugar, dietary fiber or Healthy/Western patterns derived by principal component analysis) and after a large range of sensitivity analyses.

Conclusions:

In this large observational prospective study, higher consumption of ultra-processed foods in the diet was associated with a higher risk of T2D. Public health authorities in several countries recently started to recommend privileging unprocessed/minimally processed foods and limiting ultra-processed food consumption.

Key messages:

- The consumption of ultra-processed food is associated with an increased risk of type 2 diabetes. As the French Public Helath agency recommends, their consumption should be limited.
- Nutritional composition, food additives, contact materials, or neoformed contaminants might play a role in these associations and further studies are needed to understand their relative contribution.

Effects of salt reduction on cardiovascular risk factors. The STRIVE-study

Ulla Toft

U Toft[1]*, NL Riis*[2]*, AD Lassen*[2]*, E Trolle*[2]*, KS Bjørnsbo*[1]
[1]Center for Clinical Research and Prevention, Bispebjerg Hospital, Frederiksberg, Denmark
[2]National Food Institute, Technical University of Denmark, Kgs. Lyngby, Denmark
Contact: ulla.toft@regionh.dk

Potential adverse effects of reducing salt intake in the general population are discussed. This study aims to explore the effect of gradually reducing salt intake in a real-life setting.

The study was a 4-month cluster RCT with families randomly assigned to either A) salt reduced bread, B) salt reduced bread and dietary counselling or C) standard bread (control) Participants in intervention A received bread gradually reduced in salt content from 1.2 g salt/100g (regular) to 0.6 g salt/100g in ryebread and 0.4 g salt/100g in wheat bread. Participants in intervention B received the same bread as intervention A but in addition, they received dietary advise on how to further reduce their salt intake and promote potassium. The control group received regular bread (blinded). Changes in outcomes were assessed using linear mixed models.

Results:

A total of 89 Danish families (155 adults; 156 children) participated in the study. A total of 291 (94%) participants completed the intervention. Results are preliminary. Intention to treat analyses showed no significant effects of the salt reduction intervention on changes in systolic and diastolic blood pressure, plasma triglyceride. A small, but significant (-0.26 mmol/l; P = 0.02) decrease in total plasma cholesterol was shown in intervention group A. Per protocol analyses, including only participants in the intervention groups that decreased their salt intake by at least 20% from baseline to 4-month follow-up, showed a significant decrease in diastolic (-3.5 mmHg; $P < 0.0001$) and systolic (-6.3 mmHg; $P < 0.0001$) blood pressure, total cholesterol (-0.25 mmol/l; P = 0.0009), LDL cholesterol (log. transformed) (-6%; P = 0.03) and plasma triglyceride (log. transformed) (-17%; P = 0.04). No significant effects were found for HDL plasma cholesterol, aldosterone, renin, plasma glucose and HbA1c.

Conclusions:

Reduced salt intake were associated with beneficial changes in cardiovascular risk factors. No adverse effects were observed.

Key messages:

- Reduced salt intake were associated with benificial changes in cardiovascular risk factors.
- No adverse effects were observed.

A future for all to INHERIT: taking integrated action on the environment, health and equity

Caroline Costongs

I Stegeman[1], *R Strube*[2], *R Bell*[3], *I Zvěřinová*[4], *B Staatsen*[5]
[1]EuroHealthNet, Brussels, Belgium
[2]CSCP, Wuppertal, Germany
[3]UCL, London, UK
[4]Charles University, Prague, Czech Republic
[5]RIVM, Bilthoven, Netherlands
Contact: c.costongs@eurohealthnet.eu

The need to act on climate change, and to modify how we live, move and consume is urgent; failure to do so will have catastrophic effects on health and wellbeing over the medium and long term. INHERIT, a large multi-sectoral research initiative (2016-2019) has explored what can be done to seize this as an opportunity to encourage and enable people to modify their behaviours towards ones that simultaneously protect the environment and promote health and health equity (the ‘INHERIT triple-win’).

One strand of INHERIT’s work has involved the identification, implementation and evaluation (qualitative, quantitative and cost-benefit) of 15 promising ‘triple-win’ interventions across the EU. INHERIT has also developed four positive scenarios of more sustainable futures, questioned 183 people about these, and surveyed 10,288 people from five countries across the EU about their current behaviours and incentives for change.

The results of these investigations paint a complex picture of what can be done to encourage and enable more people across the socio-economic gradient to adapt their behaviours. They reflect that improving health is a powerful motivator for action to protect the environment, yet there is often confusion about what is considered ‘sustainable’, whether this is always ‘healthy’ and vice-versa, let alone equitable. There is resistance in some countries to modifying some behaviours, like meat consumption. Many people fear that technological solutions will drive up isolation and inequities, and desire stronger community ownership over processes like food and energy production.

INHERIT outcomes reflect that it is possible to conjure common visions of the kinds of societies we want to transition to, and a willingness and potential to work across sectors to achieve these. This requires stronger individual and collective leadership, also from public health actors, who can play a key role in bringing together different actors and sectors to achieve these visions.

Key messages:

- The urgent need to address the environmental crisis presents an opportunity to simultaneously manage closely related societal challenges linked to health and equity.
- Public health actors can play a key role by bringing together the sectors, evidence and examples to instigate change, around the common interest of promoting human, which depends on planetary, health.

Dietary pesticide exposure profiles in the NutriNet-Santé cohort

Pauline Rebouillat

P Rebouillat[1], *R Vidal*[2], *J-P Cravedi*[3], *L Debrauwer*[3], *L Gamet-Payrastre*[3], *M Touvier*[1], *S Hercberg*[1], *D Lairon*[4], *J Baudry*[1], *E Kesse-Guyot*[1]

[4]Aix Marseille Université, INSERM, INRA, C2VN, Marseille, France
Contact: p.rebouillat@eren.smbh.univ-paris13.fr

Pesticides are commonly used in current agriculture and some negative effects are suspected for human health but evidence from dietary exposure in the general population is lacking. This study aimed to describe dietary pesticide exposure among French cohort participants. Organic and conventional food consumption was assessed using a self-administered semi-quantitative food frequency questionnaire in 2014 in the NutriNet-Santé cohort. Exposure to 25 commonly used pesticides was estimated using contamination data (CVUA Stuttgart) accounting for farming system. Dietary pesticide exposure profiles were identified using Non-negative Matrix Factorization, adapted for non-negative sparse data and then introduced in a hierarchical clustering process. The 6 identified clusters ($n = 34,193$) seemed to be exposed to the same molecules with gradual intensity. Cluster 1 was characterized by the lowest energy-intake and dietary pesticide exposure, and high consumption of organic food groups (23.3%). Proportion of male participants was higher than in other groups. Clusters 2 and 5 were characterized by intermediate energy intake, lower organic food consumption and intermediate pesticide exposure. High conventional fruits and vegetables intake and high pesticide exposure were observed in cluster 3, composed of a lower smokers’ proportion. Cluster 6 was characterized by the highest energy intake, lowest organic food consumption (9%), and highest pesticide exposure; high consumption levels of conventional fruits, vegetables and a higher proportion of vegans were observed. For cluster 4, pesticide exposure varied more across molecules than for other clusters. The highest exposures were observed for Acetamiprid, Azadirachtin, Cypermethrin, Pyrethrins, Spinosad pesticides. Proportion of organic food in the diet was the highest (31.5%).

Dietary pesticide exposures seem to vary across the clusters and related to the proportion of organic food in the diet.

Key messages:

- Dietary pesticide exposures seemed to vary gradually across the clusters and depending on the proportion of organic food in the diet.
- High consumers of conventional FV in this cohort seem to be more exposed to our selection of pesticides.

5.N. Round table: Health literacy and life skills: children and adolescents’ tools for health promotion

Organised by: EUPHA (HP)
Chair persons: Luís Saboga-Nunes - EUPHA (HP), Carine Simar - France
Contact: saboga.nunes@gmail.com

This round table aim is to explore transculturality of methods and instruments to assess Health Literacy (HL) and Life Skills (LS) in Childhood and Adolescence and integrate this discussion in the overall context of HL research in the European context.

HL and LS focuses on the knowledge and skills that enable people to access, understand, evaluate and apply information in order to make health decisions and promote health and well-being. While research in the past focused basically on adults, HL & LS research in children and adolescents is a novel field of study.

Specific study cases from France and Portugal will help frame the discussion.

The CrAdLiSa (developing ChildRen and ADolescents’ health Literacy) research project is focused on exploring the usability of previous tools and instruments - already implemented in other European countries - to evaluate the feasibility of their cultural adaptation and validation.

The research focuses on a public health perspective addressing qualitative, quantitative, and intervention research in context of health literacy (HL) and Life Skills (LS) and e-HL of children, adolescents, and professionals working in education, health, and social care settings.

Following the track left by Nairobi (2009) and the Shangai declarations (2016) HL has evolved into a significant public health and health promotion goal which has been included to several public health policies (eg. in Portugal, the General Health Directorate of Health (GHDH), established its first policy that focused on children and adolescents HL PNSE|2015, 8815/2015 DR, II, n° 154, 10-08-2015).

Present first time empirical findings and developments of these projects and open the floor for further discussion. On top of this, LS will be addressed from the methodological perspective. Thereby, it will shed light on the HL and LS of children and adolescents and link the current debate with contemporary public health approaches to advance the field of HL and LS in childhood and adolescence.

The round table will include 3 presentations with up to 15 minutes input followed by discussion. The first presentation is a theory-driven project about developing a conceptual LS model adaptation for children and adolescents in France. The second will introduce a HL questionnaire and its validation data from a pilot study in 4th grade (9-10 y.o.). The third presentation will explore findings of a pilot study by using a HL measure in children (9-10 y.o.) and the relationship between functional HL and subjective health.

This round table offers a forum for researchers, practitioners and policy-makers interested in HL and health promotion. By dialogue and two-way communication lively interaction and vivid discussions will be facilitated. This will allow discussing results regarding their benefit for improving HL research, practice, and policy-making, support further synergies, facilitate networking and collaboration, and support international capacity building.

Key messages:

- There is need for empirical health literacy and life skills research in children and adolescents.
- A more broad discussion needs to be developed regarding concepts, instruments and strategies for health literacy and life skills promotion.

French validation of a measurement scale of life skills for children

Carine Simar

C Simar[1], J Masson[1], J Pironom[1], C N'Sambu[1], D Tessier[1]
[1]Université Clermont Auvergne, Clermont-Ferrand, France
Contact: carine.simar@uca.fr

Background:

According to WHO (2003), 'Life skills' are defined as psychosocial abilities for adaptive and positive behaviour that enable individuals to deal effectively with the demands and challenges of everyday life. They are loosely grouped into three broad categories: cognitive for analyzing and using information, personal for developing personal agency and managing oneself, and inter-personal skills for communicating and interacting effectively with others. Skills-based health education is an approach to creating or maintaining healthy lifestyles and conditions through the development of knowledge, attitudes, and especially skills, using a variety of learning experiences, with an emphasis on participatory methods. Our aim was to develop an integrated measure of the life skills grouped into three broad categories of skills for children who are at least 9 years old. The present communication is focused on the validation in a French validation of a tool measuring social competencies in children - Weiss et al. (2014) - which represents one of the three categories of psychosocial competencies (emotional and cognitive competencies).

Methods:

Data were collected three times during year 2017-2018: 614 questionnaire (T1), 564 (T2), 331 (T3) - 311 children filled the questionnaire three times. Three types of analyses were conducted in order to assess the validity and reliability of social competence (SPSS version 23 et AMOS version 21): Validity of construct, concurrent validity and reliability.

Results:

The results show a high reliability and a good validity of construct and concurrent, thus indicating satisfactory psychomotor qualities.

Conclusions:

This compendium will also assess the validity and reliability of this scale with the data collected at the other two measurement times and study the predictive validity of the scale. The same process will be applied to the cognitive skills measurement scale for validation. Acknowledgment: CPS team and schools and pupils involved.

Portuguese cultural adaptation and validation of the European Health Literacy Survey (HLS-EU) for children aged 9 to 10 (HLS-EU-PTc)

Luís Saboga-Nunes

L Saboga-Nunes[1,6], H Dias[2], C Andrade[3], O Okan[4], T Bollweg[4], G Carvalho[5], U Bittlingmayer[6]

[3]Universidade dos Açores, UA, Ponta Delgada, Portugal
[4]Centre for Prevention and Intervention in Childhood and Adoloscence, Bielefeld University, Bielefeld, Germany
[5]Universidade do Minho, Braga, Portugal
[6]Institute of Sociology, University of Education Freiburg, Freiburg, Germany
Contact: saboga.nunes@gmail.com

Introduction:

To measure Health literacy (HL) as proposed in the context of the European Health Literacy Survey/questionnaire (HLS-EU-Q), the Health Literacy for Children and Adolescents (HLCA) Consortium (GE) adapted it for children. A trans-cultural adaptation and validation to Portuguese (HLS-EU-PTc), will supply policy makers, experts and health professionals with information that can promote healthier communities while fighting health disparities.

Methods:

After permission was granted from the HLCA Consortium the TRAPD model was used (eg parallel translation, focus groups, two back translations). An assessment and pretesting of HLS-EU-PTc was done with 16 children for cognitive testing. A qualitative explanatory (n = 16) and quantitative, cross-sectional study (n = 82), age mean 13, SD 0.96, from Portugal (mainland) was implemented for proceed with the validation process. A variety of measures were obtained like internal consistency and mean scores.

Results:

Preliminary results for evaluation of the psychometric properties of the HLS-EU-PTc show satisfactory internal consistency (Cronbach's alpha coefficient 0.87). In a scale from 1 (very difficult) to 4 (very easy) for indicators of the HLS-EU-PTc, we have a mean of 3.25 and a SD of .478.

Conclusions:

This is the first study to examine the feasibility of a Portuguese version (HLS-EU-PTc) of the HLS-EU-Q adapted for children and it indicates high internal consistency and level of self-reported HL. The usefulness of the HLS-EU-PTc instrument can be further discussed while planning public health policy strategies from the HL standpoint. The validated HLS-EU-PTc version of the HLS-EU-Qc survey, with the user's manual can be accessed at www.literacia-saude.info.

Health Literacy questionnaire development for 9 and 10 years old: a discussion of assessment tools!

Alcinda Reis

A Reis[1], I Barroso[1], L Saboga-Nunes[2,4], O Okan[3], T Bollweg[3], U Bittlingmayer[4]
[1]Santarém Health School, IPsantarém, Santarém, Portugal
[2]ProLiSa, Public Health Research Centre, National School of Public Health, Universidade NOVA de Lisboa, Lisbon, Portugal
[3]Centre for Prevention and Intervention in Childhood and Adoloscence, Bielefeld University, Bielefeld, Germany

[4]Institute of Sociology, University of Education Freiburg, Freiburg, Germany
Contact: alcinda.reis22@gmail.com

Background:

With Health literacy (HL) investments - to promote health and self-care during people's life cycles (childhood, especially) - health professionals approach is multi-dimensional: within the family, school settings and community. The objective of this study is to explore the feasibility and usability of a questionnaire to characterize HL levels among 9 and 10 years old. It is expected that this will help health care personal to better focus health promotion initiatives in the school setting.

Methods:

The CrAdLiSa project in conjunction with the HLCA German Consortium, implemented a field test for the newly developed HL assessment tool for children in the Portuguese context. This is a deductive-inductive, exploratory-descriptive study including 16 children, with 9 and 10 years old, from 2 different elementary schools in Santarém District (rural and urban areas). Semi-structured interviews aim at exploring the cognitive appraisal of concepts and indicators at the base of the questionnaire developed to assess HL levels. Data was subjected to content analysis, with a priori and a posteriori categorization.

Results:

Preliminary results point to the cognitive comprehension by children of the feasibility of an instrument to assess their HL levels. It depicts discriminatory capabilities (to allow characterization of low, medium or high levels of HL). Children living in urban areas, having better financial resources are less likely to develop obesity, or low weight. Better self-perception of school performance, good relationship with family members, parents with higher education or higher levels of HL appear to have better quality of life.

Conclusions:

Results suggest the need to invest in children's and families' HL, while taking into consideration personal, environmental and socioeconomic determinants. School settings should be considered as a natural arena to improve children's (and, as a result, families' and communities') HL levels.

5.O. Workshop: Climate change and energy issues in our life-course and our environment

Organised by: EUPHA (ENV)
Chair persons: Peter Van Den Hazel - EUPHA (ENV), Marija Jevtic - EUPHA (ENV)
Contact: Peter.van.den.Hazel@vggm.nl

Globalization and economic trends bring enormous changes to civilization. Growth in demographic, economic and human activities alters the natural global environment beyond safe or sustainable borders. Energy domain is one of these borders we cross. These changes pose threats to human health and with the rise in temperature the visible symptoms are seen in the difficulty of securing sufficient and clean energy, as well as the appropriate supply of health-safe food and water.

Overall progress made through the use of renewable energy sources should reduce risks and allow for the improvement of basic living conditions. However, a significant shift in reducing inequalities and improving global quality of life and health indicators requires transformation of many sectors.

The calculated health impacts and health costs from Western Balkan coal plants are a case study that show 3,000 premature deaths, 8,000 cases of bronchitis in children, and other chronic illnesses; costing both health systems and economies a total of EUR 6.1-11.5 billion. Another example illustrates how schools can contribute to change. Results from behavioral change studies show the audience in which frame they fit in their possibilities to influence their behavior towards their living environment. Followed by a discussion on strategic choices on how to motivate people to protect their environment and climate.

Key messages:

- Energy issues are a main driver in reducing health risks.
- Knowledge about framing our values towards climate change might change our behavior.

Climate and energy issues as preconditions for health and well being

Marija Jevtic

M Jevtic[1,2], C Bouland[2]
[1]Faculty of Medicine, University of Novi Sad, Novi Sad, Serbia
[2]Research Centre on Environmental and Occupational Health, Université Libre de Bruxelles, Brussels, Belgium
Contact: marija.jevtic@uns.ac.rs

Globalization and modern economic trends bring enormous changes to civilization. The human health pattern also changes and the overall system becomes more complex. Exponential growth in demographic, in economic and in human activities alters the natural global environment beyond safe or sustainable borders, which refers to energy for the future, as well as climate change in the broadest sense. These changes pose threats to human health and with the rise in temperature the most visible symptoms are seen in the difficulty of securing sufficient energy amount, as well as the appropriate supply of health-safe food and water. Global influences on the health of the population require changes in different sectors (economy, health, economy, etc).

Even though, World Meteorological Organization data show that the five-year average global temperature from 2013 to 2017 was at a record level, and that in 2017 it was one of the three hottest years. Today, about 3 billion people have no access to safe food and/or water and are also exposed to significant air pollution. Nearly one billion people have no electricity in the household, and 13% of the world's population has no access to modern electricity. Air pollution indoors by using combustible fuels for domestic energy caused 4.3 million deaths in 2012 (women and girls accounted for 6 out of 10). Energy has a dominant contribution to climate changes and accounts for about 60% of overall global greenhouse gas emissions.

Overall progress made through the use of renewable energy sources should reduce risks and allow for the improvement of basic living conditions. However, a significant shift in reducing inequalities and improving global quality of life and health indicators requires transformation of many sectors. Energy, therefore, is crucial for almost every challenge the world is facing today (climate change, food production, health systems, etc.). SDG 7 is particularly important and is linked to other SDGs.

Impacts of transboundary coal air pollution from Balkan region to European public health

Vlatka Matkovic Puljic

V Matkovic Puljic[1], D Jones[2], L Myllyvirta[3], R Gierens[3]
[1]Health and Environment Alliance (HEAL), Brussels, Belgium
[2]Sandbag, London, UK
[3]Greenpeace, Brussels, Belgium
Contact: vlatka@env-health.org

Background:

Western Balkan region holds coal power plants that are old, inefficient and substandard. In 2016, the region's 16 plants emitted more SO2 than the entire 250 European coal power plants. In this study we modelled the transboundary nature of air pollution affecting this region and EU.

Methods:
We calculated health impacts and costs from Western Balkan coal plants by the following steps: (1) Identify coal power plants in the Western Balkans in 2016; (2) Source 2016 coal power plant emissions data; (3) Model the pollutant exposure resulting from the emissions from Western Balkan coal power plants; (4) Calculate health impacts associated with modelled pollutant exposures; (5) Attribute the health impacts to individual coal power plants; (6) Calculate the cost of the health impacts.

Results:
The modeling shows that every year Western Balkans' plants cause 3,000 premature deaths, 8,000 cases of bronchitis in children, and other chronic illnesses costing both health systems and economies a total of € 6.1-11.5 billion. The EU bears the majority of health cost, more than half of these health costs relate to the EU (€ 3.1 to 5.8 billion), a third (32%) to Western Balkan countries (€ 1.9 to 3.6 billion) and around 17% in other countries. Moreover, Bulgaria and Croatia's health budgets are the most heavily impacted. Costs needed to cover the health impacts of Western Balkan coal pollution amount to € 0.3-0.7 billion. For Bulgaria this is the same as 10%-18% of the country's total health expenditure in 2016. For Croatia (costs of € 0.2-0.4 billion), it amounts to 8%-14% of total health expenditure in 2016.

Discussion:
These results imply an coal phase out to protect public health. Strong enforcement of the existing pollution control measures are needed. Political processes such as EU accession of Balkan countries may be a door to prioritise pollution control and air quality, in particular by excluding companies planning new coal power capacity from EU financing.

Healthy schools, healthy children – achieving climate-friendly and health promoting buildings for future generations

Anne Stauffer

A Stauffer[1]
[1]Health and Environment Alliance (HEAL), Brussels, Belgium
Contact: anne@env-health.org

Children spend a significant amount of their time in schools indoors, and the quality of this indoor environment influences their health and their ability to learn. Recent studies have demonstrated the specific vulnerability of children to air pollution, especially particulate matter (PM). However, awareness among the public, parents and policy-makers on indoor air quality in schools is low, and media reports are scarce. Therefore policy measures have largely focused on providing clean air outdoors. With the political drive to improve the climate footprint of buildings, including schools, there is an urgent need to consider air quality and health.

The presentation will present results from a project by the Health and Environment Alliance on citizens science monitoring of outdoor and indoor air quality in more than 40 schools in 6 European capitals, Berlin, Paris, Madrid, Warsaw, Sofia and London in the spring of 2019. Pollutants measured included PM and NO2; as well as CO2 concentrations. Strategies on how to achieve an energy efficient and health promoting school environment will also be discussed.

How to frame our behaviour in order to limit climate change?

Peter Van Den Hazel

P Van Den Hazel[1,2,3]
[1]Environment and Health, Public Health Sevices Gelderland-Midden, Arnhem, Netherlands
[2]Health and Environment Alliance (HEAL), Brussels, Belgium
[3]International Network on Children's Health, Environment and Safety (INCHES), Ellecom, Netherlands
Contact: peter.van.den.hazel@vggm.nl

The climate is changing and speedy changes in society are needed to keep the damage within survival ranges. The aim is to keep the average raise of global temperature below 2 degrees Celsius. Changes in behavior of the overall population are needed to realize this aim. How can we get people to change? The research field of environmental psychology looks at framing issues to promote changes of behavior. More information helps to make people make decisions. Motivation is more important. Motivation is driven by our values and self-image. Four values are important for environmental behavior: hedonic, egoistic, altruistic and environmental values. Besides that culture, personal and timing issues play a role. The workshop explores the values in persons according to different examples. Can we influence the values to which we adhere? Socio-economic traits in people only explore a few percent in differences.

Discussion: different strategies can be used with people with different dominant values.

Public health is a major domain to support the local authorities to endorse the behavioral changes in the general population in order to limit the temperature increase.

5.P. Prepare, prevent and protect

Development of a European Public Health Emergency Preparedness Training Toolkit

Stefano Guicciardi

S Guicciardi[1], *MP Fantini*[1], *E Savoia*[2], *MA Stoto*[3], *C Nelson*[4], *R Piltch-Loeb*[5], *J Pommier*[6], *M Ciotti*[6], *P Riley*[6]
[1]Department of Biomedical and Neuromotor Sciences, University of Bologna, Bologna, Italy
[2]Harvard T.H. Chan School of Public Health, Boston, USA
[3]Georgetown University, Washington, USA
[4]RAND Corporation, Santa Monica, USA
[5]New York University, New York, USA
[6]European Centre for Disease Prevention and Control, Stockholm, Sweden
Contact: stefanoguicciardi.mail@gmail.com

Background:
In 2017, under the supervision of the European Centre for Disease Prevention and Control (ECDC), a list of competencies and knowledge and skill statements for EU professionals working in Public Health Emergency Preparedness (PHEP) systems were identified and integrated into a Competency Model. Building on these efforts, a PHEP competency-based training toolkit was developed, pilot tested and finalized with the goal of providing a standardized training resource for experts involved in response to cross-border threats to health.

Objectives:
Led by the ECDC, an international research team drafted a preliminary version of a curriculum consisting of five modules, with a list of targeted competencies, learning objectives, reading and training methods including case studies and simulation exercises. In May 2018, the curriculum was pilot tested in a 3.5-day training course at the University of Bologna, Italy. The participants included 20 representatives from 8 EU Member States. An evaluation strategy, combining both quantitative and qualitative methods, was designed to assess the impact of the training on participants' applied knowledge and competence.

Results:
Overall, the participants' feedback on the pilot course was positive, with scores from 4.0 to 4.8 out of 5 for all the items considered. Several suggestions were made both by the trainers and the trainees to enhance the effectiveness of the learning activities, and the curriculum was integrated into a training

toolkit with more exercises, teaching materials and a guide for facilitators.

Conclusions:

This European Public Health Emergency Preparedness Training Toolkit is the first EU competency-based toolkit intended to help Member States improve their response to public health emergencies through standardized training. Designed for individuals working in strategic positions at the national level, its general approach, modular structure and content are relevant and can be tailored to a wider range of professionals.

Key messages:

- To improve PHEP in the EU, competency-based curricula and standardized training programs and resources for health professionals are needed.
- By enhancing the overall public health professionals' experience and competency, the European PHEP Training Toolkit represents a step towards strengthening preparedness and response systems in the EU.

Heat Waves and occupational injuries: the importance of a consistent working definition

Matteo Riccò

M Riccò[1], *F Balzarini*[2], *AG Mezzoiuso*[2]
[1]Dipartimento di Sanità Pubblica, Azienda USL di Reggio Emilia, Reggio Emilia, Italy
[2]Scuola di Specializzazione in Igiene e Sanità Pubblica, Università, Milan, Italy
Contact: mricco2000@gmail.com

Introduction:

Heatwaves (HWs) have been linked with increased risk of occupational injuries (OIs). As no consistent definition of HW is globally acknowledged, also the actual impact of HWs on the workplaces is not well defined.

Background and aims:

Daily numbers of workers compensation claims from all Northern Italy (2013 to 2017, warm season: April to September) from Agricultural and Industry economic sectors ($n = 1,907,122$) were associated with daily weather data. The impact of average (Tday) and maximum (Tmax) daily temperatures on the risk of OIs was assessed using a time-stratified case-crossover study. HW was defined by 3 or more days having Tday $>$ 97.5th percentile or by Tmax exceeding 5 °C or more historical reference.

Results:

A total of 1161205 OIs were retrieved (94.4% from industrial sector). Assuming Tday $<$ 90th percentile as the referent category, the risk for OIs was higher for Tday exposure 95 to 97.5th percentiles (OR 1.43, 95%CI 1.09-1.20 for agriculture; OR 1.40, 95%CI 1.03-1.05 for industry) and for exposures exceeding 97.5th percentiles (OR 1.14, 95% CI 1.09-1.20, OR 1.02, 95%CI 1.01-1.03, respectively), and for days characterized by Tmax $>$ 35 °C (OR 1.27, 95%CI 1.21-1.33; 1.03 95%CI 1.02-1.04). An increased risk for OIs was similarly identified during HWs defined by Tday (OR 1.15, 95%CI 1.08-1.23 for agriculture; OR 1.06, 95%CI 1.05-1.08 for industry), while HWs defined by Tmax were characterized by increased risk only for agricultural workers (OR 1.14, 95%CI 1.12-1.16).

Discussion:

Days characterized by very high temperatures were associated with the greatest risk of OIs in the industrial and agricultural settings. As a working definition for HW based on maximum temperatures apparently missed a possible increased risk for OIs in the industrial sector identified by average daily temperatures, our results stress the urgent need for a common and shared definition of HWs, allowing potential stakeholder to put in place appropriate prevention strategies.

Key messages:

- High environmental temperatures are associated with an increased risk of occupational injuries.
- Different working definitions of Heat Wave may lead to missing the actual risk for occupational injuries. A shared definition is therefore strongly needed.

Google Trends and forecasting of influenza epidemics in Lithuania

Donatas Austys

D Austys[1], *M Burneikaitė*[1]
[1]Department of Public Health, Institute of Health Sciences, Faculty of Medicine, Vilnius University, Vilnius, Lithuania
Contact: donatas.austys@mf.vu.lt

Background:

Influenza epidemics are a major public health concern, causing hundreds of thousands of deaths worldwide each year. Studies suggest a possible beneficial use of online activity monitoring in influenza epidemics surveillance and forecasting. Until the present time Google search user activity has not been assessed for forecasting of influenza epidemics in Lithuania. Though this country has 2.8 million residents and mother language of majority of them is Lithuanian. Thus, we assessed a possible use of Google Trends for forecasting of influenza epidemics in Lithuania.

Methods:

We translated Google queries most commonly analyzed for forecasting of influenza epidemics by other researchers to Lithuanian language and used Google Trends to retrieve data about frequency of their usage in Google Search during the period of last 5 years. We assessed cross-correlation between usage frequency of each query with an incidence rate of acute upper respiratory tract infections (AURTI) and influenza. Providing data available 2 weeks before the first announcement of influenza epidemic, for the query with the strongest correlation we constructed the autoregressive integrated moving average (ARIMA) model and used it to make a forecast for upcoming 9 weeks. Then we assessed the cross-correlation between the forecast and incidence rate of AURTI and influenza.

Results:

We found the strongest correlation with an incidence rate of AURTI and influenza for a keyword 'gripas' (correlation coefficients were 0.805 and 0.803 for lags of 0 and 1, respectively, $p = 0.001$). 75% true values of the query usage frequency fell into 95% confidence interval of the forecast by ARIMA(1,0,0)(0,1,0)[52] model. Incidence rate of AURTI and influenza correlated with the forecast having coefficients of 0.902 and 0.733 for lags of 0 and 1, respectively ($p = 0.007$).

Conclusions:

Query 'gripas' demonstrated the possible beneficial use in forecasting influenza epidemics 2 weeks before their onset.

Key messages:

- Google Trends has a potential to be used for forecasting influenza epidemics in Lithuania.
- Google Search query 'gripas' proved the most beneficial for forecasting incidence rate of upper respiratory tract infections and influenza in Lithuania.

Socioeconomic Status, Health Inequalities, and Solidarity Trends in a Mass Vaccination Campaign

Aviad Tur-Sinai

A Tur-Sinai[1], *R Gur-Arie*[2], *N Davidovitch*[2], *E Kopel*[3], *Y Glazer*[4], *E Anis*[4], *I Grotto*[4]
[1]Health Systems Management, The Max Stern Yezreel Valley College, Yezreel Valley, Israel
[2]Health Systems Management, Ben-Gurion University, Beer-Sheva, Israel
[3]School of Public Health, Tel Aviv University, Tel Aviv, Israel
[4]Epidemiology, Israel Ministry of Health, Jerusalem, Israel
Contact: avts2309@netvision.net.il

Background:

In July 2013, Israel was swept with fear of a polio outbreak. In response to the importation of wild polio virus, the Ministry decided to take preventive action by administering oral poliovirus vaccine (OPV) to all children born after 1 January 2004 who had received at least one dose of inactivated poliovirus vaccine (IPV) in the past. This study analyzes the vaccination uptake rates resulting from the mass polio vaccination campaign on the basis of health inequality parameters of socioeconomic status (SES), principles of solidarity, and the Gini inequality index. The research explores understanding the value of the Gini inequality index within the context of SES and solidarity.

Methods:

The study is based on data gathered from the Israeli Ministry of Health's administrative records from mother-and-child clinics across Israel. The research population is comprised of resident infants and children whom the Ministry of Health defined as eligible for the OPV between August and December 2013.

Results:

The higher the SES level of the area where the mother-and-child clinic is located, the lower the OPV vaccination uptake is. The greater the income inequality is in the municipality where the mother-and-child clinic is situated, the lower the vaccination uptake. As time passed in the vaccination campaign, vaccination uptake increased regardless of the location of the mother-and-child clinics. The highest vaccination uptake rate was found among populations of low SES and low Gini inequality index. The lowest vaccination uptake rate was found among populations of high SES/high Gini inequality index.

Conclusions:

Public health professionals promoting vaccine programs need to make specially-designed efforts both in localities with high average income and in localities with a high level of income diversity/inequality. Such practice will better utilize funds, resources, and manpower dedicated to increasing vaccination uptake across varying populations and communities.

Key messages:

- The higher the SES in municipalities with mother-and-child clinics, the less likely children were to be vaccinated.
- The lower the Gini inequality index, there is a higher polio vaccination uptake among of children.

A practical composite risk score for the development of HUS from STEC infection

Christopher Carroll

D Hamilton[1], *J Cullinan*[2]
[1]Department of Public Health, Health Service Executive, Tullamore, Ireland
[2]Discipline of Economics, National University of Ireland, Galway, Ireland
Contact: carrolch@tcd.ie

Background:

Haemolytic Uraemic Syndrome (HUS) is a serious complication of Shiga toxin-producing Escherichia coli (STEC) infection and the key reason why intensive health protection against STEC is required. However, although many potential risk factors have been identified, accurate estimation of risk of HUS from STEC remains challenging. Therefore, we aimed to develop a practical composite score to promptly estimate the risk of developing HUS from STEC.

Methods:

This was a retrospective cohort study where data for all confirmed STEC infections in Ireland during 2013-15 were subjected to statistical analysis with respect to predicting HUS. Multivariable logistic regression was used to develop a composite risk score, segregating risk of HUS into very low risk (0-0.4%), low risk (0.5-0.9%), medium risk (1.0-4.4%), high risk (4.5-9.9%) and very high risk (10.0% and over).

Results:

There were 1,397 STEC notifications with complete information regarding HUS, of whom 5.1% developed HUS. Young age, vomiting, bloody diarrhoea, Shiga toxin 2, infection during April to November, and infection in Eastern and North-Eastern regions of Ireland, were all statistically significant independent predictors of HUS. Demonstration of a risk gradient provided internal validity to the risk score: 0.2% in the cohort with very low risk (1/430), 1.1% with low risk (2/182), 2.3% with medium risk (8/345), 3.1% with high risk (3/98) and 22.2% with very high risk (43/194) scores, respectively, developed HUS.

Conclusions:

We have developed a composite risk score which may be of practical value, once externally validated, in prompt estimation of risk of HUS from STEC infection.

Key messages:

- We have identified vomiting, bloody diarrhoea, age <10 years, Shiga toxin 2, STEC infection during April-November and in the East/North-East of Ireland as independent predictors of HUS.
- Using these variables we have developed a practical composite risk score that could be used by clinicians and public health teams to promptly assess the risk of HUS from STEC infection.

Impact of safety-engineered devices (SEDs) on the prevention of percutaneous injuries

Jacopo Garlasco

J Garlasco[1], *MC Ottino*[1], *E Rainero*[1], *A Argentero*[1], *CM Zotti*[1]
[1]Department of Public Health Sciences and Paediatrics, University of Turin, Turin, Italy
Contact: jacopo.garlasco@unito.it

Background:

Needlestick injuries represent a major occupational hazard for healthcare workers as they lead to exposure to biological fluids, with higher risk of bloodborne pathogen infections. In order to minimise this risk, safety-engineered devices (SEDs) have been developed and introduced into the daily hospital practice. An annual survey, conducted by the Department of Public Health Sciences of the University of Turin since 1999, has been evaluating the number of percutaneous accidents in the hospitals of Piedmont (Italy), assessing also the impact of the introduction of SEDs on the injury incidence rate. The aim of this study is therefore to evaluate the efficacy of SEDs in preventing needlestick injuries.

Methods:

Data about percutaneous injuries and needle consumption were obtained from 42 hospitals of Piedmont for the years 2014-2017, concerning all the types of needles and sharps most commonly used in the departments. After considering the overall trend of percutaneous events, standardised rates for 100000 needles were computed for both SEDs and conventional devices. The same analysis was performed considering all sharps except standard needles, which are mainly used for procedures not involving contact with patients (e.g. drug dilution).

Results:

The comparison between the incidence rates with SEDs and conventional devices showed a slightly protective effect of SEDs in 2014, 2016 and 2017, with an incidence rate ratio ranging from 0.78 to 0.97. However, by removing the confounding effect of standard needles, the analysis yielded strong statistical evidence of the protective effect of SEDs for all years (RR = 0.28-0.63). Moreover, the total number of percutaneous events shows a trend of general decrease.

Conclusions:

Safety devices have proved to be significantly effective in the prevention of needlestick injuries, and their introduction into the daily practice is one of the factors who could contribute to a reduction of percutaneous events.

Key messages:

- Safety-engineered devices are a very important tool in the prevention of injuries in healthcare workers, and their introduction into hospital practice has reduced the number of percutaneous injuries.
- Safety-engineered devices are significantly protective against percutaneous injuries compared to conventional ones, especially for procedures involving contact with patients (therefore at high risk).

Rabies vaccination strategies in a western country: a cost evaluation

Anita Suijkerbuijk

AWM Suijkerbuijk[1], MJJ Mangen[2], MR Haverkate[3], SE Bantjes[3], WLM Ruijs[3], CM Swaan[3], LG Visser[4], EAB Over[1], FS Luppino[5], GA de Wit[6,1]

[1]Nutrition, Prevention and Health Services, RIVM, Bilthoven, Netherlands
[2]Infectious Diseases, Epidemiology and Surveillance, RIVM, Bilthoven, Netherlands
[3]National Coordination Centre Communicable Disease Control, RIVM, Bilthoven, Netherlands
[4]Department of Infectious Diseases, LUMC, Leiden, Netherlands
[5]Eurocross Assistance, ECA, Leiden, Netherlands
[6]Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, Utrecht, Netherlands
Contact: anita.suijkerbuijk@rivm.nl

Introduction:

Rabies is a fatal but preventable infectious disease with a large disease burden in endemic countries. The risk of contracting rabies for travellers from a Western country is low. However, an increasing number of Dutch travellers, potentially exposed to rabies abroad, consult a clinician for post-exposure prophylaxis. In this study, several interventions were examined on how they might influence costs involved in rabies treatment and prevention, including the most recent vaccination guidelines and the use of intradermal vaccination.

Methods:

A decision tree based economic model was constructed. Costs of new versus old guidelines, intramuscular versus intradermal vaccination, and post-exposure treatment subsequent to increased vaccination coverage in several risk groups were calculated and compared to each other. Statistical uncertainty with respect to numbers of travellers and vaccination coverage was assessed.

Results:

Costs were highest using the old guidelines, estimated at €15.1 million (€405 per vaccinated person). Intradermal vaccinations in combination with the new guidelines led to the lowest costs, estimated at €10.1 million (€270 per vaccinated person). A higher vaccination uptake resulted in higher overall costs. The ratio between the additional vaccinated persons and additional costs in all risk groups was similar, around €104 per person.

Conclusions:

The new rabies vaccination guidelines reduced total costs. Strategies with increased vaccination uptake led to fewer rabies immunoglobulin administrations and fewer vaccinations after exposure but at higher total costs. Although intradermal administration of rabies vaccination on a large scale can reduce total costs of pre-exposure prophylaxis and can positively influence vaccination uptake, it remains a costly intervention.

Key messages:

- The new vaccination guidelines reduce total costs of rabies prevention. Intradermal administration of rabies vaccination on a large scale can further reduce total costs of pre-exposure prophylaxis.
- Strategies with increased vaccination uptake lead to fewer rabies immunoglobulin administrations and fewer vaccinations after exposure but at higher total costs.

5.Q. Workshop: Health workforce meets HSR: Tackling regional inequalities in health service provision

Organised by: EUPHA (HSR), EUPHA (HWR)
Chair persons: Judith de Jong - EUPHA (HSR), Ellen Kuhlmann - EUPHA (HWR)
Contact: j.dejong@nivel.nl

Background:

Many countries across Europe are facing considerable challenges in providing accessible and high quality care regardless of where people live. A major element is the difficulty that countries face to attract and retain health care professionals to work in remote and rural areas. This applies to primary care services as well as to hospital care, and to the care provided by physicians and other health professionals, including nurses. A widely shared question is therefore how to safeguard access to health care in rural areas and to solve recruitment and retention problems in such regions, both of medical and nursing staff. The workshop will build on last year's joint workshop of the Sections on HSR and HWR that ended with questions related to how to organize accessible and equitable health services including the workforces required to do so.

Objectives:

This workshop will provide a snapshot of studies from across the European region, with a particular focus on differences between rural and urban health care practices and the types of solutions being used to reduce regional disparities in provision of care. This often refers to retention and recruitment strategies, but the session will also address other types of solutions in the organization of care that can help ensure accessible care, including in vulnerable regions and settings. Tackling this challenge will therefore require a joint approach, tapping into experience from health workforce research as well as wider health services research, bringing together research into the organization and management of healthcare and into the health human resources providing this care, operated from different angles and being informed by different research traditions and data sources. Based on statements, we will discuss the topic of how to organize accessible and equitable health services including the workforces required to do so after the presentations.

Key messages:

- Workforce policies should focus on retaining primary care workforce in rural areas and integrated policies should attract new primary care practices.
- Both in primary care and hospital care new solutions are being sought which should help resolve regional differences in access to care and attractiveness for the health workforce.

Rural and urban general practice: a comparison in 34 countries

Peter Groenewegen

P Groenewegen[1], M Bosmans[1], W Boerma[1]

[1]Nivel, Utrecht, Netherlands
Contact: p.groenewegen@nivel.nl

Background:

Rural areas have problems in attracting and retaining primary care workforce. Comparable problems but with a different background occur in deprived urban areas. Here we focus on primary care practices that do work in rural areas and not on the shortage or lack of access for the rural population. We answer the question whether these practices have a different organisation, lack resources and have different service profiles, compared to practices in semi-rural and urban areas.

Methods:

We used data from the QUALICOPC study, conducted among approximately 7,000 GPs in 34 (mainly European) countries, on the organisation of practices, their human resources and equipment and their service profiles. Data were analysed using multilevel regression analysis, with countries and GPs as levels.

//blrnas3/cenpro/ApplicationFiles/Journals/OUP/EURP/Vol00000/190193/Comp/APPFile/OP-EURP190193.3d [25.10.2019–6:48pm] [6–298] Paper: OP-EURP190193

Results:

In general the practices in rural areas are more often single-handed and have less other primary care workers available. In most countries they have more equipment and their service profiles are broader, in particular as compared to inner-city urban practices.

Conclusions:

The combination of increasing demand for care and under-supply of health care services can lead to a primary care shortage in rural areas. However, the practices that are currently located in rural area in most countries seem to be able to cope with the situation by providing a broader range of services, compared to service-rich urban areas. Against growing health needs of an ageing and often poorer population, there is a risk of lack of facilities and equipment and ageing staff. Until now this is not manifest in the primary care practices in most countries.

Regional shortages in a small country: how to provide the right care in the right place?

Johan Hansen

J Hansen[1]*, R Batenburg*[1,2]*, E Vis*[1]*, L Van der Velden*[1]
[1]Nivel, Utrecht, Netherlands
[2]Radboud University, Nijmegen, Netherlands
Contact: j.hansen@nivel.nl

Background:

The Netherlands, though being a relatively small and densely populated country, is faced with a similar challenge as other countries in terms of regional differences in access to care and attractiveness for care workers to build their careers. Both in primary care and hospital care new solutions are being sought which should help resolve these growing difficulties.

Methods:

We conducted a literature review, survey and registry analysis, and held interviews with key stakeholders.

Results:

Substantial differences exist between regions in the supply of both primary care and hospital care doctors. Particular and less populated regions appear to be hit in multiple ways, both with an extra ageing population requiring more care as well as by limited attractiveness for both primary care and hospital care workers. Solutions being used so far are mostly initiated by individual health care settings, such as strategic personnel management, redistribution of tasks and campaigns to increase the inflow of staff. Increasingly, solutions are also being explored at regional level, including a growing emphasis on regional collaboration, both in providing the right care in the right place as well as in terms of joint recruitment strategies. Still, such approaches only have a limited effect as a result of which new approaches are needed.

Conclusions:

Strategies to improve the attractiveness of particular regions are now often fragmented, both between types of professions and sectors and different regions. In addition, innovative and new solutions appear to be hampered by vested interests of stakeholders. If new solutions are to be developed it is key that stakeholders are willing to compromise, be it when it comes to the autonomy of health care professionals and their associations and to the financial commitments required from government and insurer side.

eHealth solutions to regional shortages in the health workforce

Luís Velez-Lapão

L Velez-Lapão[1]*, M Maia*[1]*, G Dussault*[1]
[1]Global Health and Tropical Medicine, Universidade NOVA de Lisboa, Lisbon, Portugal
Contact: luisvlapao@gmail.com

Background:

Healthcare systems are facing significant challenges, from demographics, shortage of health professionals to increasing costs that are associated with increasing demand. New technologies are thought to be a solution to these problems. However, the question is if the digitalization of healthcare will mitigate these problems and the shortage of health professionals in Europe.

Methods:

This study provides a scoping review on existing health digital services aiming to cope with health professional shortage in Europe. The main challenges, from workforce performance, services quality, patient-interaction to technology use are addressed. The databases of Pubmed and Ebsco were searched.

Results:

38 papers were selected and analysed addressing eHealth with impact on the workforce performance. It highlights the challenges associated with the digitalization of healthcare, the implementation of digital services, considering the design online service, and the impact of digitalization on healthcare workforce performance. An overview of the major effects of transformative technologies (e.g. eHealth services, Internet of Things solutions, Artificial Intelligence) on the healthcare workforce are addressed. Moreover, what are the major implications of technological change for future skill needs and competences of the public health workforce? Are there any reliable projections on how technologies will change the structure of the labour market for health professionals? And to what extent is the workforce equipped to adapt to the changes?

Conclusions:

Proper digitalization of healthcare will enable changes in the paradigm of healthcare delivery as well as in the mechanism for patients' participation and engagement. Sustainable implementation of eHealth is an important opportunity to address health workforce shortage but it is not enough.

6.A. Ferenc Bojan: young investigator award session

Health coach online - health benefits on the citizens terms

Moa Kuitunen

M Kuitunen[1]*, A Cavrak*[1]
[1]Hälsocoach online, Västra Götaland Region, Gothenburg, Sweden
Contact: moa.e.persson@vgregion.se

In Sweden, we know that half of the women and two thirds of the men have one or more unhealthy lifestyle habits. We also know that 90% of all diabetes type 2, 80% of all heart attacks and 30% of all cancer can be prevented, if one has a healthy lifestyle. Consultative conversations have been proved very helpful while changing ones habits. The lifestyle habits of Swedes are similar to those of other countries in Europe, and by making our research available and the concept known to other countries, the overall health in Europe can improve.

In August 2017 an online practice opened in a county in south west of Sweden, were we performed lifestyle interventions with people who applied and needed it. The practice specialized in eating habits, physical exercise, alcohol and tobacco use. We have 4-6 consultative meetings during 3 to 4 months, where we help our clients set realistic goals to reach, that work in their day to day life. While using coaching techniques and motivational interviewing, we have met over 200 people, and helped improve their lifestyle.

We have seen that in regarding to self-assessed health (1-10), our clients score is higher after both completed health coaching and a year after completed coaching than at start. Calculating QALY, we can see that the impact the coach makes on our clients is cost effective and one person being coached saves the amount in hospital costs that we can use to coach 30 more.

We have learned that online meetings are more cost effective and practical for this type of concept. Our clients feel more relaxed and open to the process at a location of their choosing and it saves time for them, time they might not have taken otherwise - therefore, we can help more people. Meetings online enables us to reach all over the Västra Götaland region, and not only the close proximity where the coaches are located.

Key messages:

- Online health coaching supports our health care and helps the citizens to improve their lifestyle habits and their overall health.
- The online method is cost effective and it saves money for both health care and society.

Egg consumption and risk of total and cause-specific mortality in a Mediterranean population

Licia Iacoviello

E Ruggiero[1], A Di Castelnuovo[2], S Costanzo[1], M Persichillo[1], A De Curtis[1], C Cerletti[1], MB Donati[1], G de Gaetano[1], L Iacoviello[1,3], M Bonaccio[1]
[1]Department of Epidemiology and Prevention, IRCCS NEUROMED, Pozzilli, Italy
[2]Cardiocentro, Mediterranea, Naples, Italy
[3]Department of Medicine and Surgery, University of Insubria, Varese, Italy
Contact: licia.iacoviello@moli-sani.org

Background:

The relation between egg intake and health outcomes is controversial. We aimed to evaluate the association of egg consumption and risk of mortality in a large sample of an adult Mediterranean population.

Methods:

We prospectively analyzed 22,849 men and women aged $\geq$35 y, recruited within the Moli-sani Study (2005-2010). Dietary data were collected by the EPIC food frequency questionnaire, egg intake was expressed as g/d and used as ordered quintiles. Hazard ratios (HR) with 95% confidence interval (95%CI) were calculated by multivariable Cox-regression and competing risk models.

Results:

Over a median follow up of 8.2 y, a total of 1,237 deaths were ascertained. Mean weekly intake was 1.8 eggs (13 g/d) and regular consumers (27 g/d corresponding to more than 2 eggs per week) were more likely to report less risk factors (e.g. history of cardiovascular disease, diabetes, smoking habit). After adjustment for possible confounders, eating eggs >2 times/week) was associated with increased risk of all-cause mortality (HR = 1.21; 95%CI 1.02-1.44 for Q4 vs Q1) and coronary heart disease/cerebrovascular mortality (HR = 1.51;1.04-2.18, for Q4 vs Q1) in a non-stepwise manner; eating more than three eggs per week increased risk of cardiovascular mortality by 33% (HR = 1.33;95%CI 1.00-1.76 for Q5 vs Q1), while no association was found with cancer death or mortality for other causes. Dietary cholesterol explained up to 37% of the excess of CVD mortality risk associated with the highest egg intake (>3 eggs/week).

Conclusions:

Regular egg intake (>2 times/week) was associated with increased risk of CVD mortality in a general Mediterranean population, and part of this association was likely due to its cholesterol content.

Key messages:

- Eating egg regularly is not associated with health benefits, rather it appears to increase CVD mortality risk.
- High dietary cholesterol content is likely to be on the pathway between egg intake and increased CVD mortality.

Nutritional quality of food consumed (graded by the FSAm-NPS / Nutri-Score) and mortality in Europe

Mélanie Deschasaux

M Deschasaux[1,5], I Huybrechts[2], N Murphy[2], C Julia[1,3], S Hercberg[1,3], B Srour[1], P Ferrari[2], E Riboli[4], M Gunter[2], M Touvier[1]
[1]Nutritional Epidemiology Research Team (EREN), Inserm U1153, Inra U1125, Cnam, Paris 13 University (CRESS), Bobigny, France
[2]Nutrition and Metabolism Section, International Agency for Research on Cancer, Lyon, France
[3]Public Health Department, Avicenne Hospital (AP-HP), Bobigny, France
[4]Faculty of Medicine, School of Public Health, Imperial College London, London, UK
[5]on behalf of all EPIC collaborators, Bobigny, France
Contact: m.deschasaux@eren.smbh.univ-paris13.fr

Background:

Unhealthy diets are major contributors for non-communicable diseases (NCDs) and related deaths. To help consumers make healthier food choices, political authorities are considering implementing a simple label to reflect the nutritional quality of food products. The Nutri-Score, based on the nutrient profiling system of the Food Standards Agency (FSAm-NPS), was chosen by several countries in Europe (France, Belgium, Spain). Yet, its implementation is only voluntary per EU regulation. Scientific evidence is therefore needed regarding the relevance of the FSAm-NPS at the European level. Hence, our objective is to study how the nutritional quality of foods consumed graded by the FSAm-NPS relates to NCDs-related mortality in European populations.

Methods:

Our prospective analyses included 501,594 adults from the EPIC cohort (1992-2015, median follow-up: 17.2y). Usual food intakes were assessed with standardized country-specific methods. The FSAm-NPS was calculated using the 100g content of each food in energy, sugar, saturated fatty acid, sodium, fibres, proteins, and fruits/vegetables/legumes/nuts. Multi-adjusted Cox proportional hazards models were computed.

Results:

The consumption of foods with a higher FSAm-NPS score (lower nutritional quality) was associated with a higher risk of mortality overall (n = 50,743 events: HRQ5vs.Q1 = 1.06 [95%CI: 1.02-1.09], P-trend<0.001) and by cancer (n = 21,971 events: HRQ5vs.Q1 = 1.06 [1.01-1.11], P-trend = 0.003), respiratory diseases (n = 2,796 events: HRQ5vs.Q1 = 1.33 [1.16-1.52], P-trend<0.001) and cardiovascular diseases, although more weakly (n = 12,407 events: HRQ5vs.Q1 = 1.05 [0.98,1.11], P-trend = 0.04).

Conclusions:

In this large multinational European cohort, consuming foods with a higher FSAm-NPS score was associated with higher mortality, supporting the relevance of the FSAm-NPS to grade the nutritional quality of food products for public health applications (e.g, Nutri-Score) to guide the consumers towards healthier food choices.

Key messages:

- The consumption of food products with a lower nutritional quality as graded by the FSAm-NPS score was associated with higher mortality in the large multinational European EPIC cohort.
- This adds support to the relevance of the FSAm-NPS to grade the nutritional quality of foodstuffs for public health applications (e.g. Nutri-Score label) to help consumers make healthier food choices.

Consumption of ultra-processed foods and the risk of overweight, obesity, and weight trajectories

Bernard Srour

B Srour[1,4], M Beslay[1,4], B Allès[1], E Chazelas[1], M Deschasaux[1], S Hercberg[1,2], CA Monteiro[3], E Kesse-Guyot[1], M Touvier[1,5], C Julia[1,2,5]
[1]Inserm, Nutritional Epidemiology Research Team (EREN) - INSERM - University of Paris 13, Bobigny, France
[2]APHP, Public Health Department, Avicenne Hospital APHP, Bobigny, France
[3]University of Sao Paulo, University of Sao Paulo - Department of Nutrition and Public Health, Sao Paulo, Brazil

Contact: b.srour@eren.smbh.univ-paris13.fr

Previous epidemiological studies found associations between the consumption of ultra-processed foods (UPF) and the risk of obesity-related outcomes. The aim of this study is to investigate the associations between UPF consumption and the risk of overweight and obesity, and weight trajectories, in in the French large scale NutriNet-Santé cohort.

Methods:

Overall, 110260 participants aged at least 18 years from the French NutriNet-Santé cohort (2009-2019) were included. Dietary intakes were collected using repeated 24h dietary records, merged with a food composition database of 3300 different products, categorized according to their degree of processing by the NOVA classification. Associations between UPF intake and risks of overweight and obesity were assessed using Cox proportional hazard models. Associations between UPF intake and weight trajectories were assessed using linear mixed models for repeated measures with random slope and intercept.

Results:

UPF intake was associated with a higher risk of overweight ($n = 7063$ incident cases; hazard ratio for an absolute increment of 10 in the percentage of ultra-processed foods in the diet $= 1.11$ (1.08-1.14); $P < 0.0001$) and obesity ($n = 3066$ incident cases; $HR = 1.09$ (1.05-1.13); $P < 0.0001$). Higher consumers of UPF (4th quartile) were more likely to present an increase in body mass index over time ($\beta = 0.04$, $P < 0.0001$). These results remained statistically significant after adjustment for several markers of the nutritional quality of the diet (fruits and vegetables and sugary drinks consumption, intakes of saturated fatty acids, sodium, sugar, dietary fiber or Healthy/ Western patterns) and after a large range of sensitivity analyses.

Conclusions:

In this large observational prospective study, higher consumption of UPF was associated with a higher risk of overweight and obesity. Public health authorities in several countries recently started to recommend privileging unprocessed/minimally processed foods and limiting UPF consumption.

Key messages:

- The consumption of ultra-processed food is associated with an increased risk of overweight and obesity. As the French Public Helath agency recommends, their consumption should be limited.
- Nutritional composition, food additives, contact materials, or neoformed contaminants might play a role in these associations and further studies are needed to understand their relative contribution.

Relationship between sleep patterns and multimorbidity in the Canadian Longitudinal Study on Aging

Saverio Stranges

K Nicholson[1], *R Rodrigues*[1], *K Anderson*[1,2,3], *P Wilk*[1,2,4], *G Guaiana*[1,3], *S Stranges*[1,5,6]

[1]Department of Epidemiology & Biostatistics, Western University, London, Ontario, Canada

[2]Lawson Health Research Institute, Western University, London, Ontario, Canada

[3]Department of Psychiatry, Western University, London, Ontario, Canada

[4]Department of Paediatrics, Western University, London, Ontario, Canada

[5]Department of Family Medicine, Western University, London, Ontario, Canada

[6]Department of Population Health, Luxembourg Institute of Health, Strassen, Luxembourg

Contact: saverio.stranges@uwo.ca

Background:

Sleep difficulties are an unmet public health problem, affecting large segments of the population around the world. Poor sleep quality and reduced sleep duration impact over half of older adults and are associated with adverse health outcomes like multiple chronic diseases (multimorbidity) and reduced longevity.

Methods:

A cross-sectional analysis of the Canadian Longitudinal Study on Aging (CLSA), a national health survey of community-dwelling adults and older adults. A total of 30,011 participants had physiological and psychosocial data collected at baseline. Sleep measures included self-reported sleep duration (short: <6 hours, normal: 6-8 hours, long: >8 hours) and sleep quality (dissatisfied/very dissatisfied, neutral, satisfied/very satisfied). To capture multimorbidity, a primary definition was operationalized with 17 chronic conditions, whereas a secondary definition was operationalized with 9 chronic conditions to capture both the primary care and public health perspective.

Results:

In our sample, 50.9% were female (average age: 62.7 years) and 49.1% were male (average age: 63.2 years). The majority reported a normal sleep duration and approximately half reported being either satisfied or very satisfied with sleep quality. About 70% were living with multimorbidity using the primary care definition (females: 71.7%; males 64.3%), while about 30% were living with multimorbidity using the public health definition (females: 34.8%; males: 28.9%). The adjusted analyses indicated the odds of multimorbidity increased for those who reported short or long sleep duration, as well as dissatisfaction with sleep quality, across age groups and both females and males.

Conclusions:

Disrupted sleep may be an additional behavioural risk factor for a number of chronic diseases, in the context of aging populations. It is necessary to understand the potential impact of sleep on the risk of multimorbidity, and this research will build knowledge in this important area.

Key messages:

- This research will utilize a national health survey to examine and report the characteristics of sleep quality and sleep duration among approximately 30,000 community-dwelling adults in Canada.
- This research will explore relationships between sleep duration, sleep quality and multimorbidity (controlling for confounding factors) among community-dwelling adults in Canada.

6.B. Health of refugees in Europe

Difference in access to health care for newly arrived refugees in Germany: a natural quasi-experiment

Judith Wenner

J Wenner[1], *K Rolke*[1], *O Razum*[1]

[1]Bielefeld University, School of Public Health, Department of Epidemiology & International Public Health, Bielefeld, Germany

Contact: judith.wenner@uni-bielefeld.de

Background:

Providing quantitative evidence on structural access barriers to health care for newly arrived refugees constitutes a challenge due to a lack of suitable data. The coexistence of two different local access models in Germany allows for a comparative analysis of the association between access policies and realized access. Our study compares these two models to establish whether they lead to differences in access to care among refugees.

Methods:

Municipalities in Germany's largest federal state of North Rhine-Westphalia (NRW) have implemented different access models to which refugees are quasi-randomly assigned. We recruited 6 municipalities of which 3 decided to implement the health care voucher (HcV) model and 3 the electronic health card model (eHC) in a natural quasi-experimental study design. Analyses were based on claims data collected from the welfare offices or the statutory health insurance. We compared standardized incidence rates (SIR) based on 3 indicators: emergency service, ambulatory sensitive hospitalization and use of specialized care.

Results:

We included data on health care use of all recently assigned refugees in the 6 municipalities over a period of 7 quarters (2016/17). The average quarterly sample size is n = 9,077 which corresponds to 6.5% of the population of recently assigned refugees in NRW at that time. We find differences in realized access between the models. For emergency care, the SIR differ significantly between municipalities using the HcV model (SIR:1.88; 95%-CI: 1.62-2.18) and eHC model (SIR:1.33; 95%-CI: 1.14-1.55).

Conclusions:

Local decisions regarding the organization of access to health care are associated with differences in realized access to health care of refugees in NRW. The implementation of the eHC model may contribute to a decrease of emergency service. Further analyses should attempt to reduce a possible (self-)selection bias of municipalities which might have led to an underestimation of the difference between models.

Key messages:

- The organization of health care for newly arrived refugees on the local level is decisive for their access to care.
- Local policy makers may use their scope for action to remove access barriers for newly arrived refugees.

Explaining healthcare among unaccompanied minor refugees: a realist review

Hanna-Sophie Ulrich

H Ulrich[1], *M Mlinarić*[1], *E Kohler*[1]
[1]Institut für Medizinische Soziologie, Martin-Luther-Universität Halle-Wittenberg, Halle (Saale), Germany
Contact: hanna-sophie.ulrich@medizin.uni-halle

Introduction:

Existing research on psychosocial care of unaccompanied minor refugees (UMRs) mainly focusses on socio-epidemiological accounts and qualitative evidence from the perspective of experts in the field of psychosocial care. In contrast, knowledge concerning differing context factors as well as underlying mechanisms of current healthcare barriers, which could inform policy recommendations, are rather scant.

Methods:

To synthesize scientific evidence and gray literature dealing with the field of psychosocial healthcare of UMRs, a realist review (RR) was conducted following six methodological steps of RAMESES publication standards for realist synthesis. Based on a iterative search of keywords ''UMR'', ''UMF'', ''UMA'' and ''mental health care'' in electronic databases PubMed, GBV and Web of Science we gained access to 974 texts from 2005 to 2019. Screend studies and reports were systematically reviewed according rigor and relevance, which included n = 53 documents for realist synthesis with theory-informed context-mechanism-outcome configurations (CMOs).

Results:

UMRs have a high prevalence risk for posttraumatic stress disorders and they face manifold institutional, cultural, ethical, juridical, and language-based barriers of care. A dominant and multiple CMO highlight residence status (C1), which limits access of UMRs to healthcare (M1) and produces psychosocially related mental health outcomes (O1). Residence status (C1) may also trigger mechanisms of structural or at least perceived discrimination (M2), which mediates undersupply of UMRs (O2).

Conclusions:

The inclusion of lay perspectives and an intersectional approach could inform health services research and practitioners. The reflection of UMR's social positions between categorical constructs of resilience and vulnerability, discriminatory discourses of othering, and restrictive health policies may guide policy recommendations to potentially reduce persistent disadvantages.

Key messages:

- The inclusion of lay perspectives and an intersectional approach could inform UMR related health services research and practitioners.
- The reflection of UMR's social positions (between categories, discourses, and health policies) may guide policy recommendations to potentially reduce persistent disadvantages.

Contraceptive use among undocumented migrant women seen by Médecins du Monde in the Humanitarian Hub

Felipe Rojas Lopez

V Déom[1], *L Ben Abdelhafidh*[1], *F Rojas Lopez*[1], *I Vanden Bussche*[1], *C Glorie*[1], *X De Bethune*[1]
[1]Département Santé, Médecins du Monde, Saint-Josse-ten-Noode, Belgium
Contact: Rojaslopez.felipe@gmail.com

In order to address the growing needs of the undocumented migrant population living in the Maximilian Park in Brussels, Médecins du Monde and 8 other organisations created The Humanitarian Hub in January 2018 where migrants can access medical care among other services. From January to February 2018, only 5 women out of 1483 patients visited The Humanitarian Hub regarding sexual & reproductive health and none asked about contraception. In response, a voluntary demedicalized midwifery clinic was implemented to build trust with the women and offer them contraception.

At our field teams' request, operational research was conducted. We used a mixed methodology, including retrospective quantitative analysis of patient files and field observations made during participant observation sessions. These observations helped us better understand the barriers women face in accessing contraception and how migration complicates its usage.

By implementing gender-sensitive consultations, the number of women patients rose from 5,4% to 10,6% in 2018. Between March 2018 and March 2019, 144 women consulted midwives regarding their sexual & reproductive health. Quantitative analysis on pre-exposure contraception on 52 files showed that 4 used a contraception, 25 women requested one, 4 refused it, 19 discussed it with the midwife, and among them, 8 agreed to try it. The most common reasons for the 80 consultations analysed were requesting contraception (62,5%), including morning-after pills (12,5%) and fear of pregnancy (32,5%). The most common contraceptive method was the pill (63,6%) followed by injections (30,3%).

Our medical team saw 29 women with unwanted pregnancies, which confirms the importance of focusing on contraception options for migrant women, although addressing this may be difficult in medical consultations. It also supports the need to implement demedicalized midwifery consultations to facilitate sensitive discussions with migrant women.

Key messages:

- Our research shows that contraceptive use is a particularly sensitive challenge in the irregular migrant women population due to the particularities of their lives.
- The development of demedicalized midwifery consultations helps professionals give irregular migrant women feasible advice on contraception in regard to their unique situations.

Injuries of adult asylum seekers in Finland: results of the 2018 TERTTU-health and well-being survey

Ferdinand Garoff

P Doupi[1], *N Skogberg*[2], *A Castaneda*[2], *F Garoff*[2]
[1]Welfare and Health Promotion, National Institute for Health and Welfare, Helsinki, Finland

[2]Equality and Inclusion, National Institute for Health and Welfare, Helsinki, Finland
Contact: ferdinand.garoff@thl.fi

Background:

Injuries in refugees and asylum seekers result of accidents, violence or most extremely torture. Research in Finland has shown that many refugees experienced major traumatic events in their former home country, incl. permanent injuries. Our study provides new evidence on asylum seekers, a scarcely studied group.

Methods:

Data was collected by structured face-to-face interviews. Healthcare staff asked adult participants if they had a bodily injury or scar. If yes, they pointed the location on a pictogram. Interviewers inquired if the injury was accidental or result of violence and if it happened before or during the fleeing trip. Injuries were classified as head (incl. brain) injuries, injuries of torso/extremities or other body areas.

Results:

About half (47, 2 %) of 779 adults reported injuries, men more often than women (55,1 % vs. 35,3 %). Frequency was highest in 18-29-year olds. Close to all respondents (94 %) sustained injuries prior to their journey. Over one in five attributed injuries to accident (men 27 %, women 16 %). 16,6 % reported the torso/extremities as injury location, while 9,4 % had head injuries. Violence was cause of injury in over one fourth of cases (28 %). Every third male and every fifth female were violence victims, with no significant age difference. In both genders odds of violence exposure was highest in asylum seekers from sub-Saharan Africa - over 50 % attributed injury to violence. Violence victims had injuries of torso/extremities in 20,5%, and of the head in 15,3%. Head injuries were more frequent in > 40 year-old violence victims of both genders.

Conclusions:

Injuries are common among adult asylum seekers in Finland. Prevalence of violence induced injury, especially in sub-Saharan Africans, is alarming. Training in violence victims' management is required for professionals receiving asylum seekers. Information on injury severity and functional ability is needed for full impact assessment and service planning (incl. rehabilitation).

Key messages:

- Injuries are common among adult asylum seekers and often a result of violence, thus requiring of receiving services' professionals skills and knowledge in violence victims' management.
- Health examination protocols of asylum seekers should include injury severity assessment and impact on functional ability.

Health of asylum seeker children in Finland: a total population health examination survey (TERTTU)

Natalia Skogberg

N Skogberg[1], P Koponen[2], E Lilja[1], K-L Mustonen[1], F Garoff[1], A Ahmed[1], AE Castaneda[1]
[1]Equality and Inclusion, National Institute for Health and Welfare, Helsinki, Finland
[2]Public Health Solutions, National Institute for Health and Welfare, Helsinki, Finland
Contact: natalia.skogberg@thl.fi

Background:

There is scarcity of representative population-based data on the health and wellbeing of asylum seekers in Europe, especially children and adolescents. The Asylum Seekers Health and Wellbeing Survey (TERTTU) was launched to inform evidence-based policy-making and development of services.

Methods:

A sample of all first-time asylum applicants was drawn from the Finnish Immigration Services electronic asylum database. Data on 303 children aged 0-17 years was gathered with a standardised health examination (including a dental assessment for 7-17 year-olds) and face-to-face-interview including the Minimum European Health Module and somatic and behavioural symptoms over the past 30 days. Guardians of 0-12 year-olds were interviewed, 13-17 year-olds responded themselves. Participation rate was 72%.

Results:

62% (95% CI 49,4-73,0) of 13-17 year-olds have had their growth and development monitored compared with 91% (95% CI 83,6-95,6) of 7-12 year-old and 86% (95% CI 79,4-91,0) of 0-6 year-olds. Long-standing health problems were more common among 13-17 year-olds (28%, 95% CI 18,2-39,7) and 7-12 year-olds (25%, 95% CI 16,8-34,2) compared 0-6 year-olds (13%, 95% CI 8,2-19,5). Sleep disturbances were more common among 13-17 year-olds (35%, 95% CI 24,2-47,4) and 7-12 year-olds (28%, 95% CI 19,6-37,5) than 2-6 year-olds (18%, 95% CI 11,3-26,7). Approximately fifth of children aged 7-17 years and slightly more than tenth of younger children had fears and anxieties. Signs of dental caries were found in 46% (95% CI 35,4-55,9) of 7-12 year-olds and in 23% (95% CI 14,1-35,1) of 13-17 year-olds.

Conclusions:

Timely and accurate assessment of healthcare needs is crucial to support and improve the health and wellbeing of children and adolescents. Survey data will be used for developing the national initial health assessment protocol for asylum seeking children and adolescents.

Key messages:

- The TERTTU Survey is the largest population-based health examination survey among newly-arrived asylum seeking adults, adolescents and children in Europe, allowing for examining family units.
- Health information on asylum seeking children and adolescents in Finland, is relevant for service development, also for other European countries.

Chronic pain and migration-related factors among Syrian refugees: a cross-sectional study

Elisabeth Stromme

EM Strømme[1], J Haj-Younes[1], W Hasha[1], LT Fadnes[1], B Kumar[2], E Diaz[1,2]
[1]Department of Global Public Health and Primary Care, University of Bergen, Bergen, Norway
[2]Unit for Migration and Health, Norwegian Institute of Public Health, Oslo, Norway
Contact: elisabeth.stromme@uib.no

Background:

Refugees display high rates of chronic pain. However, the relationship between refugee-related exposures introduced along their migration trajectories and the development of chronic pain remains unclear. The aim of this study was to assess the impact of stressors induced at various migration stages on chronic pain in Syrian refugees.

Methods:

This is a cross-sectional survey among adult Syrian refugees in Lebanon and in Norway. We conducted logistic regression to study the associations between chronic pain and migration-related factors experienced prior to or during flight (trauma exposure, migrating alone and detainment) and after arrival in a new country (legal status, social relationships, living conditions and access to health care).

Results:

Altogether 827 Syrians participated (response rate 85%). The mean age was 33 years and 41% were women. The overall prevalence of chronic pain was 30%. The mean WHO Quality of Life (WHOQOL) domain scores for both social relationships (13.4) and environment (10.2) were significantly lower among those reporting chronic pain, with low scores indicating less satisfaction. Regression analyses revealed an association between chronic pain and exposure to trauma (adjusted odds ratio (AOR) 2.5 (1.8; 3.4)), but no clear association between chronic pain and migrating alone or history of detention. Poor social relationships (AOR 1.9 (1.2; 3.1)), poor support from friends (AOR 1.5 (1.0; 2.1)) and poor living place (AOR 1.4 (1.0; 2.0)) were associated with reporting chronic pain, although associations reduced when adjusting for traumatic experiences. The associations between chronic pain and poor economy (AOR 1.6 (1.1; 2.5)) and poor access to health care (AOR 1.5 (1.0; 2.1)) persisted after trauma exposure adjustment.

Conclusions:

We found a strong relationship between trauma exposure and chronic pain. Further, perceived poor economy and poor access to health care were associated with chronic pain regardless of trauma history.

Key messages:

- Trauma exposure, perceived poor economy and poor access to health care are associated with chronic pain among Syrian refugees.
- Public health care interventions should consider the combined impact of risk factors throughout the migration trajectory.

Antonovsky meets Honneth or: The sense of coherence and intersubjective forms of recognition

Ulrike Garstenauer

D Rosenlechner-Urbanek[1], *U Garstenauer*[1]
[1]Social Work, Salzburg University of Applied Sciences, Salzburg, Austria
Contact: ulrike.garstenauer@fh-salzburg.ac.at

Persons who flee their home country are confronted with innumerous stressors. The action research project PAGES (Participation and Health Literacy of Asylum Seekers and Recognised Refugees in Salzburg) asked how their subjective health can be supported - despite experiences of uncertainty and inactivity in the asylum process. In the two yearlong accompanying qualitative research the project investigated into the role of participation, consistency and un-der/overload balance - as defined by (Antonovsky 1979, 1987) - for the well-being of 20 refugees from Syria, Iran, Iraq, Afghanistan, Pakistan, Somalia and Venezuela, aged between 17 and 58 (two thirds thereof were women). The analysis of empirical data showed that the subject-oriented dimensions (Antonovsky 1979, 1987) need to be complemented by intersubjective forms of recognition. First, findings stress the importance of support by ‘‘legitimate others’’ (e.g. social workers) in order to develop a sense of manageability, only briefly mentioned by Antonovsky (1987). Second, the experience of emotional closeness (Shagy/Antonovsky 2000, sphere of love in Honneth 1995) is essential for a person’s well-being, which is often hindered by isolation in refugee camps, relationships under distress or denied family reunification. A third crucial intersubjective dimension is legal recognition and the protection of one’s human dignity (Honneth 1995), which is often violated by racism and other forms of discrimination. Fourth, refugees seek the opportunity to rally for social esteem for their capacities and particularities (Honneth 1995), which is - at least in Austria - hindered by the denial of access to educational institutions and gainful work.

According to these findings, health promotion for refugees in welcoming countries needs to enable positive life experiences regarding participation, comprehensibility, manageability/support by ‘‘legitimate others’’ and emotional closeness, legal recognition and social esteem.

Key messages:

- For a deeper understanding of salutogenesis, the subject-oriented elements of the sense of coherence (Antonovsky 1987) need to be complemented by intersubjective forms of recognition (Honneth 1995).
- Health promotion means enabling experiences of participation, comprehensibility, manageability as well as support by ‘‘legitimate others’’, emotional closeness, legal recognition and social esteem.

Contexts between mental health of fledged people and compassion competence in the care

Sabine Steiner

S Steiner[1]
[1]Praxis PhDr Sabine Steiner MSc, Mönchhof, Austria
Contact: tcmpraxis.dr.steiner@gmail.com

The aim of this doctoral thesis is to investigate the extent to which the competence compassion has a positive influence on the mental health of refugees. The research question was raised in a first step by means of a questionnaire by Mohr & Müller, ‘Depression tendencies in the non-clinical context’. Eighty asylum seekers were questioned in a total of seventeen lodgings. In addition, a survey was conducted with employees and volunteers in refugee care. This survey included 102 people who were assessed using the standardized BOSS1 Burnout Screening Scale. With the help of the Santa Clara Briefing Scale, the differences in the population between people who are not volunteering and those who volunteer in refugee care are being investigated through an online survey. There were 818 people attending. The evaluation of the data showed that the competency compassion lowers the depressive tendencies among the refugees and they have a more positive sense of integration and hope for a better life. The competency of compassion reduces burnout factors and people who have committed themselves voluntarily have significantly higher values in compassion competency. Thus compassion can be confirmed as a valuable competence in refugee care, not only among the refugees, but also among employees and volunteers.

Key messages:

- The present study has shown that empathy skills reduce depressive tendencies in people who have escaped.
- Associations of compassion and low burnout factors confirmed by the study showed that persons with high compassion skills have low burnout scores.

6.C. The impact of digital technologies on health management

The impact of Internet use on mental wellbeing and health behaviours among persons with disability

Mariusz Duplaga

K Szulc[1], *M Duplaga*[2]
[1]Students’ Scientific Circle, Department of Health Promotion, Institute of Public Health, Faculty of Health Sciences, Jagiellonian University Medical College, Krakow, Poland
[2]Department of Health Promotion, Institute of Public Health, Faculty of Health Sciences, Jagiellonian University Medical College, Kraków, Poland
Contact: mmduplag@cyfronet.pl

Background:

Disability is frequently related to the digital divide. However, the Internet may be also an opportunity for many people with disabilities, especially for those who suffer from difficulties in involving in social activities. For some of them, it is also a tool for undertaking professional tasks. The aim of the study was the assessment of the impact of the Internet on selected aspects of psychological wellbeing and undertaking health behaviours in persons with disabilities.

Methods:

From the data set of the biannual Social Diagnosis survey, data of respondents confirming the status of disability were extracted. They were used for the development of multivariate logistic regression models for self-assessment of life, the prevalence of suicidal thoughts, feeling lonely, the use of psychological support and health behaviours. The impact of Internet usage was adjusted for sociodemographic variables. Weights provided by the study team were used in the analysis.

Results:

The responses from 3231 respondents were used in the analysis. There were 33.1% of Internet users in the study group. Respondents with a mild disability made 25.3%, with moderate 39.4%, with severe 24.2%, and without an established degree of disability 11.1%. Logistic regression modelling revealed that Internet users more frequently assessed their lives as happy (odds ratio, 95% confidence interval (OR, 95%CI): 1.40, 1.13-1.75) and undertook some form of physical activity (2.32, 1.84-2.91). They also less frequently excessively consumed alcohol (0.51, 0.33-0.80). No relation was found for experiencing loneliness (0.89, 0.71-1.12), suicidal thoughts (0.998, 0.77-1.29), receiving psychological care (0.84, 0.62-1.14) and smoking (0.83, 0.66-1.04).

Conclusions:

Although persons with disabilities suffer from digital divide, Internet use may exert a beneficial impact on their wellbeing and favour more beneficial health behaviours.

Key messages:

- Internet access and use among persons with disabilities may be an opportunity for improved wellbeing.
- Persons with disabilities who are Internet users assess their lives as more happy and demonstrate more favourable health behaviours.

An automatic platform to monitor Web 2.0 presence of Healthcare Providers in Italy

Angelo D'ambrosio

A D'ambrosio[1], *A Barbara*[2], *O Kakaa*[1], *R Falvo*[2], *P Parente*[2], *MR Gualano*[1], *A Silenzi*[2], *R Siliquini*[1]
[1]Department of Public Health, University of Turin, Turin, Italy
[2]Section of Hygiene, Institute of Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
Contact: angelo.dambrosio@unito.it

Background:

Healthcare providers (HP) need to involve the population to spread correct and useful health information and to gather feedback on the perceived quality of the service. Web 2.0, based on the use of Social Networks (SN), allows direct communication between the HP and the population. We built an automatic platform which monitors Web 2.0 usage by Italian public and private HP.

Methods:

For each HP the platform finds the relative website using Google searches and extracts the links to SN. For Facebook and Twitter, it retrieves one year of content and identifies common topics via natural language processing. Finally, it compares the Web 2.0 usage patterns and topics with the type of HP and geographical position.

Results:

In 2017, on 540 HP screened 97.8% had a website (309 unique sites, many HP have a common site). 37.5% of the websites had links to SN in the homepage: Youtube (YT) was the most common (74.1%), then Facebook (FB, 72.4%) and Twitter (TW, 51.7%). The presence of SN was lower in the south (OR: 0.63; $p < 0.001$) while is higher for research centers (OR: 5.12; $p < 0.001$) and private hospitals (OR: 2.12; $p = 0.004$). Local Health Trusts were the most active on FB (1.86 more posts, $p = 0.004$) but research centers had more fans RR: 5.32; $p = 0.003$) and likes per post (RR: 4.95; $p < 0.001$). On TW private hospitals had the most followers (RR: 3.35; $p = 0.002$) and likes per tweet (RR: 3.95; $p < 0.001$). The most posted topics were on healthy behaviors and organizational changes, while a lower number of posts were on healthy food and vaccines. Posts on specific pathologies information and healthy behaviors received more likes.

Conclusions:

We propose an automatic platform that monitors the internet presence of HP in Italy, helping to define the best strategies for effective health communication. We found that in the south and in the public sector the importance of this tool is less perceived, with a lower SN presence and a gap between posted topics and those appreciated by the public.

Key messages:

- We propose an automatic platform that reports and monitors the web 2.0 presence and usage by HP in Italy, helping to define the best strategies to spread effective health communication.
- In Italy the presence of SN among HP is lower in the south and in the public, while is higher for research centers. HP have to engage the population maximizing the potentiality of web 2.0.

Identifying and describing a model region to evaluate the impact of telemedicine

Lorenz Harst

L Harst[1], *S Oswald*[2], *P Timpel*[3]
[1]Research Association Public Health Saxony, Technische Universität Dresden, Dresden, Germany
[2]Faculty of Medicine, Technische Universität Dresden, Dresden, Germany
[3]Department for Prevention and Care of Diabetes, Technische Universität Dresden, Dresden, Germany
Contact: lorenz.harst@tu-dresden.de

Background:

Telemedicine solutions providing patient-centered care over distance need to be integrated into the regional setting. The acceptance by both providers and patients hat to be continuously evaluated using methods of participatory implementation research. In controlled trials, often taking place in laboratory settings, these methods cannot be applied. In the following, research in progress is presented.

Methods:

Based on socio-demographic data, epidemiology prevalence of age-related chronic diseases and data on the value of health care provision in Saxony, Germany a model region was chosen. Then, a focus group ($n = 6$) was conducted to differentiate the results and analyze the health networks of patients. For this, network maps putting the individual in the middle and his/her sources of information and support in case of illness in concentric circles around it, were used. The focus group was audiotaped, transcribed and analyzed by two researchers using MaxQDA.

Results:

With a mean age of 47.8 years ($n = 17{,}431$), high prevalence of diabetes (>15.85 %) and hypertension (>39.1%) and an expected shortage of primary physicians in 2030, the town of Kamenz is a mirror image of the current health care challenges in rural areas of Saxony. Participants of the focus groups also stated problems in finding a primary physician or a dentist. Compensatory behavior, such as traveling large distances, relying on self-researched online diagnoses and immediately going to the emergency room for medical support was described. According to the network maps, primary sources of support in case of illness are partners and relatives, yet there is little connection between those and health care providers, as well as between different medical specialists.

Conclusions:

The results will lead to potential use cases of telemedicine to be included into a standardized questionnaire for the assessment of telemedicine readiness in the model region.

Key messages:

- Telemedicine implementation in a rural area can be studied using a participatory approach.
- Focus groups and network maps are useful qualitative methods for participatory research and can inform the design of quantitative measurements.

Health and web for women: preliminary results of "SEI Donna" survey

Loredana Covolo

L Covolo[1], *M Guana*[2], *G Bonaccorsi*[3], *L Brunelli*[4], *S Castaldi*[5], *A De Donno*[6], *A Mereu*[7], *M Verani*[8], *D Zaniboni*[9], *U Gelatti*[1]
[1]Unit of Hygene, Epidemiology and Public Health, University of Brescia, Brescia, Italy
[2]Department of Clinical and Experimental Sciences, University of Brescia, Brescia, Italy
[3]Department of Health Sciences, University of Florence, Florence, Italy
[4]Department of Medica Area, University of Udine, Udine, Italy

[5]Department of Biomedical Sciences for Health, University of Milan, Milan, Italy
[6]Department of Biological and Environmental Science and Technology, University of Salento, Lecce, Italy
[7]Department of Medical Sciences and Public Health, University of Cagliari, Cagliari, Italy
[8]Department of Biology, University of Pisa, Pisa, Italy
[9]Degree Course in Health Care, University of Brescia, Brescia, Italy
Contact: loredana.covolo@unibs.it

Background:

In 2018, 52% of the European population use the Web to seek health information and 77% consider it a useful tool to improve their knowledge about health. The Italian survey "SEI Donna" aims to investigate knowledge, perceptions and use of the web tools in women regarding health issues.

Methods:

We used an online questionnaire to collect data including the type of online research and the degree of trust towards different sources. We also assessed health literacy (HL) and eHealth literacy scale (eHEALS) using validated tests.

Results:

Of 7291 women who completed the questionnaire, 96% (n = 7022) seeks health information online. The 33% of women follows social media groups on health. One third of sample (31%) purchased a health product online, particularly cosmetics (75%) and supplements (41%). More than one third of sample thinks that information retrieved by web improve their health (35%) and influence their habits (34%). Half of sample (52%) searched online for a second opinion after medical examination. The reason was the need of a deepening in the 67% of cases. Overall, the HL is functional in 34% of cases, marginal in 56% and low in the rest (10%). Women with low HL trust less health information reported by institutional websites than women with functional HL, respectively 73% vs 86% ($p < 0.001$) and the eHEALS score of women less trusting is lower than those trusting, 23±7 vs 28±7 ($p < 0.001$).

One third of women declares not to be able to evaluate the reliability of a website particularly women with low HL (36%) compared to those with functional HL (20%), $p < 0.001$. Women reporting not to be able to evaluate the reliability of a website have eHEALS score lower than women who indicated an institutional website, respectively 24±7 vs 28±7 ($p < 0.001$).

Conclusions:

The results confirm the large use of the web as a tool to seek health information, have a second opinion and buy health products. A good level of HL and eHEALS seem to make women more skilled in surfing the web.

Key messages:

- The results confirm the importance to put effort on strategies aiming to improve health literacy and eHealth literacy in the population.
- In the public health communication perspective, the fact that one third of women thinks that information retrieved by web improve their health and influence their habits, must be considered.

Short-term and long-term effectiveness of an e-coaching application; the INHERIT project

Pania Karnaki

H Spelt[2], P Karnaki[1], T Tsiampalis[1], M Kouvari[1], A Petralias[1], D Zota[1], J Westerink[2], A Linos[1]
[1]Prolepsis Institute, Athens, Greece
[2]Philips Research, Eindhoven, Netherlands
Contact: p.karnaki@prolepsis.gr

Background:

Lifestyle e-coaching applications have the potential to be successful in changing people's lifestyles although it is unclear whether such support would indeed help people with lower socioeconomic status (SES). The aim of the present study, conducted within the INHERIT EU project, was to investigate the effectiveness of a lifestyle e-coaching application in increasing physical activity (PA) in lower SES groups and whether such an increase is sustained after its prolonged use.

Methods:

A two-site (Greece: N = 105, Netherlands: N = 89), two arm [Greece: 50 (experimental) and 55 (control), Netherlands: 45 (experimental) and 44 (control)], parallel group, randomized controlled trial proceeded in three phases over 19 weeks, comparing PA (as measured by the IPAQ questionnaire) of participants using a lifestyle e-coaching application with participants not using any such application. Inclusion criteria involved participants to be in low SES, have an age of 18-65 years and an estimated level of physical activity of less than 210 minutes/week, while they needed to possess a smartphone, willing to install the application and being fluent in Dutch or Greek.

Results:

Results showed that the use of the app significantly improved participants' PA in both countries, at 6 (Greece: $p = 0.015$, Netherlands: $p = 0.003$) and 19 weeks (Greece: $p = 0.002$, Netherlands: $p < 0.001$), while the effect was even higher for low physically active participants as measured at baseline, after both time periods. Compared to the control group, after adjusting for several characteristics, the experimental group achieved a better improvement of PA at 19 weeks compared to baseline ($p = 0.006$) and week 6 ($p = 0.007$).

Conclusions:

Positive effects on participants' PA after 19 weeks were observed, with the findings suggesting that the longer the application is used, the greater the improvement of PA, while the effect was more obvious among those following a sedentary lifestyle as measured at baseline.

Key messages:

- E-coaching applications could be useful in promoting physical activity among people from low SES.
- E-coaching applications are cost effective and environmentally friendly methods of promoting physical activity. Uptake by national health systems should be examined further.

6.D. Round table: Measuring values: enhancing how WHO monitors and reports on health and well-being

Organised by: WHO EURO
Chair persons: Nick Fahy - UK
Contact: fietjen@who.int

Many concepts that are key to public health policy-making are conceptual and often values-based. How such concepts can be implemented by Member States, and how the effectiveness of this implementation can be measured and reported, remains an critical challenge that all major monitoring frameworks are faced with, from Health 2020 (WHO's European policy framework for health and well-being), to the Sustainable Development Goals for Agenda 2030.

In 2016, WHO established a project to interrogate how four key values-based public health concepts can be better measured and reported on, to increase the accountability of Member States towards these concepts. Based on the priority areas of Health 2020, the concepts which were chosen are:

- resilience;
- empowerment;

- life-course approach; and
- whole of society approach.

Four Health Evidence Network (HEN) synthesis reports were commissioned from leading experts and have now been published, synthesizing the best available evidence and grey literature on these concepts, and proposing a variety of quantitative and qualitative approaches to measuring them.

The workshop will be organized as round table workshop. It will bring together the authors of all four reports to provide an overarching thematic discussion on how to enhance the monitoring and reporting of values-based public health concepts. In addition, it will also present an opportunity to discuss the findings of the reports, in particular how qualitative evidence can be deployed to make up for the shortcomings of quantitative indicators. The role of culture in informing these values-based concepts will also be discussed.

The session will be chaired by Nick Fahy, who will set the scene and provide some background to the WHO Europe project on enhancing monitoring and reporting. Jane South will then give overview of the HEN synthesis report on measuring resilience, followed Glenn Laverack, who will talk about the HEN report on measuring empowerment. Mark Hanson and Scott Greer will review their respective HEN reports on measuring the life-course approach and whole-of-society approach implementation. Each speaker will be asked to illustrate their presentation with a case study which demonstrates how qualitative evidence can enhance the monitoring and/or reporting of the various concepts.

During the discussion, a number of key questions will be discussed by the panel with input from the audience.

- How can actionable measurement strategies be derived from existing research regarding values based concepts?
- How can meaningful, country-level reporting mechanisms be expanded to include quantitative and qualitative health information and indicators?
- What is the role of cultural contexts in mediating these (and other) values-based concepts?

Key messages:

- Many key public health concepts are inherently values-based. However, this is often not acknowledged, making it challenging to monitor and report on them.
- Qualitative evidence can be key to designing more effective ways to measure the implementation of values-based public health concepts.

6.E. Workshop: Population attributable fraction: methodologies, utilization and translations into public health messages

Organised by: International Agency for Research on Cancer (IARC), INCa, France
Chair persons: Julie Gaillot - France
Contact: jgaillot@institutcancer.fr

The aim of this session is to give an overview of the methodology, applications, and translations of studies where population attributable fraction is estimated. This session will go through the methodologies of basic population attributable fractions and also further utilization of its method beyond common application today. It will therefore go through best practices and also show case how such estimates can support assessment of prevention programs and also setting up public health messages.

6.F. Maternal and perinatal health

Effects of maternity waiting homes on perinatal deaths in an Ethiopian hospital. A case-control study

Sofia Zanovello

T Dalla Zuanna[1], M Fonzo[1], M Sperotto[1], C Resti[2], A Tsegaye[2], G Azzimonti[2], F Manenti[2], G Putoto[2], C Bertoncello[1], S Zanovello[1]
[1]Università di Padova, Padova, Italy
[2]Doctors With Africa CUAMM, Padova, Italy
Contact: sofia.zanovello@studenti.unipd.it

Background:

A Maternity Waiting Home (MWH) is a residential facility located near a medical facility, where women with high risk pregnancies can await and be transferred to the medical facility shortly before delivery or earlier if a complication arise. MWH are widespread in the developing countries, to reduce the long distances to reach health facilities. The aim of this study was to investigate whether MWH was an effective strategy in reducing perinatal deaths at Wolisso Hospital in Ethiopia, from 2014 to 2017. This hospital is supported by the Italian NGO Doctors With Africa CUAMM, with a strong commitment to reduce maternal and child mortality.

Methods:

Through a case-control study, we compared perinatal mortality among women admitted via MWH and women admitted directly to the hospital. Cases were mothers who experienced at least a perinatal death before discharge. For each case, two mothers who gave birth to one or more babies alive until discharge were selected as controls. 3 groups of confounding variables were considered: maternal conditions or related to the current pregnancy, variables related to the delivery and neonatal characteristics. A regression model was built adjusting for each group. Statistically significant variables were combined in a final model.

Results:

1175 cases and 2350 controls were included. Women admitted through MWH showed a OR 0.49 (95%CI:0.33-0.71; $p < 0.000$) for perinatal mortality when adjusted for the maternal/current pregnancy conditions, and a OR 0.60 (95%CI:0.40-0.90, $p = 0.013$) when adjusted for the delivery variables. In the final model the risk of perinatal mortality for women admitted to MWH was 54% less than those admitted directly to the hospital (OR = 0.46, 95%CI:0.30-0.70; $p < 0.000$).

Conclusions:

Our results show a more than halved risk of perinatal death cases for women admitted to the hospital through a MWH in rural Ethiopia, and support the policy implemented by the government in building such structures nearby each hospital.

Key messages:

- Maternity Waiting Home is a structure near a health facility, where pregnant women at risk wait for their delivery.
- MWH is an easy and effective tool to reduce perinatal deaths in rural Ethiopia.

Breatsfeeding supression in a Spanish referral hospital (2011-17): a retrospective cohort study

Anna Llupià i García

A Llupià[1], I Torà[1], T Cobo[2], JM Sotoca[3], J Puig[4]
[1]Preventive Medicine and Epidemiology Unit, Hospital Clínic de Barcelona, Barcelona, Spain
[2]BCNatal, IDIBAPS, UB, Hospital Clínic de Barcelona, Barcelona, Spain
[3]Pharmacy Unit, Hospital Clínic de Barcelona, Barcelona, Spain
[4]Department of Mathematics, Universitat Politècnica de Catalunya, Barcelona, Spain
Contact: allupia@clinic.cat

Background:

WHO recommends measuring the role of social determinants in the initiation of breastfeeding, given that they will have an impact on the health of these mothers and babies throughout their lives. The present study, the first in Spain, describes the onset of breastfeeding through maternal and pregnancy characteristics related to breastfeeding suppression with cabergoline.

Methods:

We assessed 20965 opportunities of breastfeeding initiation, collecting data of deliveries that had an obstetric clinic history record and resulted with at least one alive baby at the Hospital Clinic of Barcelona (HCB) between January 2011 and December 2017. Adjusted odds ratios for cabergoline use during hospitalization considering maternal, neonatal and pregnancy characteristics were obtained.

Results:

Adjusting for the set of variables, inhibition of lactation was significantly higher in women without or primary studies with respect to women with higher education (OR 2.5, CI95% 2.0-3.0) and living in economically more depressed areas (OR 1.08, 1.04-1.2). Breastfeeding was also more inhibited in women who did not express intention of natural birth (OR 2.3, 1.9-2.9), smokers (OR 2.2, 1.9-2.6), with more previous children (OR 1.2 for each sibling,1.1-1.3), in term versus pre-term birth (OR 1.3, 1.2-1.4), in women with multiple births (OR 1.6, 1.2-2.1) and with higher risk pregnancy (OR 1.3 per risk point, 1.2-1.4). According to the mother's country of birth, and taking Spanish women as a reference, women born in Northern Africa (OR 0.2, 0.1-0.3), in India and Pakistan (0.2, 0.1-0.3), in Eastern Europe (0.4, 0.2-0.6) and Western Europe (0.5, 0.4-0.8) are less likely to inhibit breastfeeding. Chinese women are significantly more likelier to inhibit breastfeeding (OR 7 (5.7-8.6)).

Conclusions:

Inequalities have been detected in the inhibition of lactation in puerperal women. Knowing these inequalities in breastfeeding initiation is the first step to address them.

Key messages:

- This is the first study to describe disparities in breastfeeding inhibition in puerperal women.
- Factors related to lower socioeconomic status and poor health are more likely associated with breatfeeding suppression.

Dietary patterns and gestational weight gain: evidence from the ''Mamma & Bambino'' cohort

Andrea Maugeri

A Maugeri[1], M Barchitta[1], G Favara[1], MC La Rosa[1], C La Mastra[1], R Magnano San Lio[1], A Agodi[1]
[1]Department GF Ingrassia, University of Catania, Catania, Italy
Contact: andreamaugeri88@gmail.com

Background:

In 2009, the Institute of Medicine (IoM) revised the guidelines on recommended gestational weight gain (GWG), taking into account pre-pregnancy body mass index (BMI) independent of age and ethnicity. However, more than half of mothers does not meet these guidelines with adverse outcomes for themselves and for newborns. Here, we used data of 232 women from the ''Mamma & Bambino'' cohort (Catania, Italy) to investigate the association between maternal dietary patterns, pre-pregnancy BMI and GWG.

Methods:

Pregnant women were enrolled during the prenatal genetic counselling, at 4-20 gestational week. Dietary patterns were derived by food frequency questionnaire and principal component analysis. Self-reported pre-pregnancy BMI and GWG was calculated according World Health Organization and IoM guidelines, respectively.

Results:

Adherence to the ''western'' dietary pattern - characterized by high intake of red meat, fries, dipping sauces, salty snacks and alcoholic drinks - was associated with increased GWG ($\beta = 1.217$; SE = 0.487; $p = 0.013$), especially among obese women ($\beta = 7.363$; SE = 1.808; $p = 0.005$). In contrast, adherence to the ''prudent'' dietary pattern - characterized by high intake of potatoes, cooked vegetables, legumes, rice and soup - was associated with reduced pre-pregnancy BMI ($\beta = -0.651$; SE = 0.308; p-trend = 0.035). Interestingly, the adherence to this pattern was positively associated with GWG among underweight ($\beta = 4.127$; SE = 1.722; $p = 0.048$), and negatively among overweight and obese ($\beta = -4.209$; SE = 1.635; $p = 0.016$ and $\beta = -7.356$; SE = 2.304; $p = 0.031$, respectively).

Conclusions:

Our findings encourage further studies to evaluate potential preventive strategies against inadequate weight gain, including the promotion of healthy dietary habits even during the periconceptional period.

Key messages:

- Adherence to diet rich in red meat, fries, dipping sauces, salty snacks and alcoholic drinks increases GWG, especially among obese women.
- Adherence to diet rich in potatoes, vegetables, legumes, rice and soup was associated with lower pre-pregnancy BMI, increased GWG among underweight, and decreased GWG among overweight/obese women.

Tobacco smoking in pregnant women: fifty years of evolution in France

Nolwenn Regnault

Background:

Smoking during pregnancy is a major modifiable risk factor for maternal and foetal morbidity. We aimed to describe 1/ smoking trends in France between 1972 and 2016, 2/ the factors associated with smoking cessation and reduction during pregnancy in 2016.

Methods:

French National Perinatal Surveys are routine surveys based on a representative sample of births (N = 11,733 in 2016). Data were collected in face-to-face interviews in postnatal wards and from the mother's medical record. Smoking rates before pregnancy and during 3rd trimester were estimated for each study year and characteristics associated with smoking reduction (relative percent change in number of cigarettes smoked before and during pregnancy <50% or $\geq$ 50%) compared with smoking cessation were analysed using multinomial logistic regression.

Results:

After significantly decreasing from 1995 onwards, smoking prevalence stagnates since 2010 both before pregnancy and in the 3rd trimester (30.1% and 16.2%, respectively in 2016). In 2016, 45.8% ceased smoking during pregnancy, 37.2% reduced by $\geq$ 50% their consumption and 16.9% reduced by < 50% or did not reduce at all. The more cigarettes women smoked before pregnancy, the greater this reduction was ($p < 0{,}001$). Moderate reduction (<50%) vs stopping was more frequent in multiparae compared to nulliparae (aOR = 2,47 [IC95%:1,93-3,15]) and in women with low education (aOR(<High school vs university graduates) = 7,20 [4,78-10,82]) and low income (aOR(<1500€per month/>3000€) = 2,30 [1,51-3,50]).

Conclusions:

Smoking rates were high before and during pregnancy in France in 2016. Socio-demographic factors should be considered when targeting women most at risk of continuing smoking during pregnancy.

Key messages:

- After significantly decreasing from 1995 onwards, smoking prevalence stagnates since 2010 both before pregnancy and in the 3rd trimester in France.
- Supporting female smokers of childbearing age in their attempts to quit and remain non-smokers even after pregnancy is crucial, especially in multiparae and women in poor social condition.

Monitoring Fetal Alcohol Spectrum Disorder during the neonatal period in France

Nolwenn Regnault

S Laporal[1], V Demiguel[1], C Cogordan[2], Y Barry[1], I Guseva-Canu[1], V Goulet[1], D Germanaud[3,4,5], N Regnault[1]

[4]Paris Diderot University, Sorbonne Paris Cité, Paris, France
[5]Inserm U1129, NeuroSpin, CEA-Saclay, Gif sur Yvette, France
Contact: nolwenn.regnault@santepubliquefrance.fr

Background:

Alcohol is a known teratogenic and foetotoxic agent. At birth, only the complete foetal alcohol syndrome (FAS) and at most a suspicion for some incomplete syndromic forms can be diagnosed. Yet, other Consequences of prenatal Alcohol Exposure (CAE) can also be observed and recorded in the neonatal period. Our goal was to describe the frequency of diagnosis codes for FAS and CAE at the national and regional level.

Methods:

Between 2006 and 2013, we identified the ICM-10 codes Q860 (FAS) and P043 (CAE) in the hospital records for stays occurring in the 28 first days of life in the French national health insurance database (SNDS). Our "potential Foetal Alcohol Spectrum Disorders group" (pFASD), included the FAS and CAE subgroups. The pFASD prevalence was estimated per 1000 live births at the national and regional levels overall and then comparing: 2006-2009 and 2010-2013.

Results:

From 2006 to 2013, 3207 neonates were diagnosed with pFASD during the neonatal period, i.e. 0.48 cases per 1,000 live births, including 0.07‰ of FAS. Between 2006-2009 and 2010-2013, pFASD remained stable (p = 0.6). At the regional level, the proportion of pFASD was the most frequent in one of the overseas territories (La Reunion Island, 1.22‰ births) and in the north-eastern part of mainland France (0.90 ‰ births to 1.02 ‰).

Conclusions:

This study is the first to produce a national estimate of the frequency of neonatal diagnosis of FAS. It shows a stability of the frequency of pFASD cases recorded over the 2006-2013 period which is certainly underestimated but gives a first minimal estimate of the burden of alcohol use during pregnancy in France.

Key messages:

- Alcohol use during pregnancy remains a public health issue in France.
- Estimating the prevalence of FAS is of undeniable priority given the public health implications of these disorders that hinder the development of children exposed, and their avoidable nature.

Adverse pregnancy outcomes and long-term risk of maternal renal disease: a systematic review

Peter Barrett

P Barrett[1,2], FP McCarthy[2], K Kublickiene[3], S Cormican[4], C Judge[4], M Evans[3], M Kublickas[5], IJ Perry[1], P Stenvinkel[3], AS Khashan[1,2]

[3]CLINTEC, Karolinska Institutet, Stockholm, Sweden
[4]Department of Nephrology, University Hospital Galway, Galway, Ireland
[5]Department of Obstetrics, Karolinska Institutet, Stockholm, Sweden
Contact: peterbarrett1@hotmail.com

Background:

Little is known about the long-term risk of renal disease following adverse pregnancy outcomes, such as hypertensive disorders of pregnancy (HDP), gestational diabetes (GDM) or preterm delivery. We aimed to investigate associations between adverse pregnancy outcomes and maternal chronic kidney disease (CKD) and end-stage kidney disease (ESKD), by synthesising results of relevant studies.

Methods:

A systematic search of PubMed, EMBASE and Web of Science was done up to July 2018. Case-control and cohort studies were eligible for inclusion if they provided original effect estimates for associations between adverse pregnancy outcomes (HDP, GDM, preterm) and maternal renal disease (primary outcomes: CKD, ESKD; secondary outcomes: renal hospitalisation, renal mortality). Two independent reviewers extracted data and assessed risk of bias. Random effects meta-analyses were conducted to determine pooled adjusted odds ratio (AOR) and 95% confidence interval (95%CI) for each association.

Results:

Of 5,120 studies retrieved, 21 studies met inclusion criteria (4,483,847 participants). HDP was associated with increased odds of ESKD (AOR 6.58, 95%CI 4.06-10.65), CKD (AOR 2.08, 95%CI 1.06-4.10), renal hospitalisation (AOR 2.29, 95%CI 1.42-3.71). The magnitude of association was dependent on HDP subtype: AOR for preeclampsia and ESKD was 4.87 (95%CI 3.01-7.87); gestational hypertension and ESKD was 3.65 (95%CI 2.34-5.67); other HDP (including chronic hypertension) and ESKD was 14.67 (95%CI 3.21-66.97). Preterm delivery was associated with increased odds of ESKD (AOR 2.16, 95%CI 1.64-2.85). GDM was associated with increased odds of CKD among black women (AOR 1.78, 95%CI 1.18-2.70), but not Caucasian women (AOR 0.81, 95%CI 0.58-1.13)

Conclusions:

Women who experience adverse pregnancy outcomes have increased odds of renal disease, especially after HDP. Risk stratification and preventive interventions may be needed to reduce the risk of clinically significant renal disease in mothers.

Key messages:

- This is the first study to summarise the long-term risk of renal disease among women who experience a range of adverse pregnancy outcomes.
- Women who experience hypertensive disorders in pregnancy, preterm delivery, or gestational diabetes are at increased odds of renal disease.

6.G. Trends in diabetes and hypertension management

The Entred 3 study: a national representative sample of people with diabetes, 3rd edition-France-2019

Valerie Henry

V Henry[1], C Piffaretti[1], L Saboni[1], J Gane[1], S Fosse-Edorh[1]
[1]Santé Publique France, Saint Maurice, France
Contact: valerie.henry@santepubliquefrance.fr

Background:

In France, more than 3.3 million people are pharmacologically treated for diabetes. The 3rd edition of the Entred study was launched in 2019 in order to establish an overview of the epidemiological situation of diabetes since the last studies performed in 2001 and 2007. The main objectives are to describe and assess trends in characteristics of people pharmacologically treated for diabetes, in cost of care and clinical care pathways, in quality of care, in quality of life and in mortality and to focus on specific populations.

Methods:

A sample of 13'000 adults has been randomly selected from the two majors French health insurance systems database. Those patients are invited by their health insurance provider to answer to a short phone-based questionnaire and then to a self-administered questionnaire (mailed or by Internet). With the agreement of those patients, their physicians are suggested to answer a questionnaire to collect information concerning their clinical and biological results. A passive follow-up of the sample is implemented by extraction of participants' reimbursement and hospital discharge data from the SNDS (Système National des Données de Santé) for 20 years (the 10 years previous to and the 10 years following the sampling).

Results:

Results expected will present first rates of participation for patients and their physician. Also, a first feedback on the innovative processes of the study, collaborations between institutions and partners will also be presented.

Conclusions:

The expected results of this surveillance system based on a complementary approach (self-questionnaire, medical questionnaires and medico-administrative data) are: health status, therapeutics, economic burden, social and the quality of care pathways, the ways to improve medical practice and the quality of life of people with diabetes. Entred 3 would also be a valuable tool for orientating prevention policies that could be transposed to other countries.

Key messages:

- Entred combines data from people with diabetes, their care providers and extractions of health insurance data. This is a valuable tool for orientating care and prevention policies in diabetes.
- Entred 3 is the continuation of two previous editions and should provide important information not available in administrative database, is a major tool for all stakeholders involved in diabetes care.

Trends of diabetes-delated preventable hospitalizations in an italian region from 2006 to 2015

Fabrizio Cedrone

F Cedrone[1], P Di Giovanni[2], G Di Martino[1], F Meo[1], P Scampoli[1], T Staniscia[3]
[1]School of Hygiene and Preventive Medicine, ''G. d'Annunzio'' University of Chieti-Pescara, Chieti, Italy
[2]Department of Pharmacy, ''G. d'Annunzio'' University of Chieti-Pescara, Chieti, Italy
[3]Department of Medicine and Ageing Sciences, ''G. d'Annunzio'' University of Chieti-Pescara, Chieti, Italy
Contact: cedronefab@gmail.com

Background:

Diabetes-related preventable hospitalizations (DRPHs) are indicators of primary care effective services. The aim of this study is to compute the trends of DRPHs, and to assess the risk factors for increased in-hospital length of stay (LOS) and costs in an Italian region.

Methods:

DRPHs were computed following the AHRQ definitions, which include four types: short-term complications (PQI-1), long-term complications (PQI-3), uncontrolled diabetes (PQI-14), lower-extremity amputations (PQI-16). Trends were direct standardized on in-habitants in 2006. Negative binomial regression model was used.

Results:

In the study period PQI-1 increased +426.9 %, PQI-3 +175.5%, PQI-14 +231.7% and PQI-16 decreased -26.2%. Prolonged LOS was related to type 2 diabetes ($p < 0.001$), peripheral vascular disease ($p = 0.045$), uncomplicated hypertension ($p < 0.001$), liver disease ($p < 0.001$) for PQI-1; type 2 diabetes ($p < 0.001$), uncomplicated hypertension ($p < 0.001$), complicated hypertension ($p < 0.001$) for PQI-3; type 2 diabetes ($p < 0.001$), complicated hypertension ($p = 0.001$), metastasis ($p = 0.042$) for PQI-14; female gender ($p = 0.001$), congestive heart failure (CHF) ($p = 0.001$), valvulopathy ($p = 0.024$), BPCO ($p = 0.028$), renal failure ($p < 0.001$), liver disease ($p = 0.015$) for PQI-16.Considerable factors affecting the costs were female gender ($p = 0.005$), peripheral vascular disease ($p = 0.006$), renal failure ($p = 0.050$) for PQI-1; type 2 diabetes ($p = 0.002$), arrhythmia ($p = 0.002$), peripheral vascular disease ($p < 0.001$), BPCO ($p < 0.001$), renal failure ($p < 0.001$) for PQI-3; peripheral vascular disease ($p = 0.004$), uncomplicated hypertension ($p = 0.005$), BPCO ($p = 0.011$), renal failure ($p = 0.009$), liver disease ($p < 0.001$), psychosis ($p = 0.027$) for PQI-14; CHF ($p = 0.014$), arrhythmia ($p = 0.001$), uncomplicated hypertension ($p = 0.003$), renal failure ($p = 0.008$), deficiency anemia ($p = 0.032$) for PQI-16.

Conclusions:

DRPHs has been increasing and some comorbidities need to be better managed in outpatient setting to reduce LOS and costs.

Key messages:

- This study addresses the effect of multimorbidity on the burden of diabetes-related preventable hospitalizations using administrative data from an entire italian region over 10 years period.

- This study uses Prevention Quality Indicators to measure their burden on regional public health and produces useful evidences for the improvement of diabetes management in outpatient setting.

Motivation for change, cornerstone of diabetes self-management in patients with type 2 diabetes

Marija Jevtic

V Stanojevic[1,2,3], *M Jevtic*[3,4], *M Mitrovic*[3,5]
[1]College of Health Studies, Cuprija, Serbia
[2]General Practice Health Center, Zajecar, Serbia
[3]University of Novi Sad, Faculty of Medicine, Novi Sad, Serbia
[4]Institute of Public Health of Vojvodina, Novi Sad, Serbia
[5]Clinical Center of Vojvodina, Novi Sad, Serbia
Contact: marija.jevtic@uns.ac.rs

Background:

Personal motivation for change plays a fundamental role in creation of sustainable changes regarding diabetes self-management. The aim of this study is to assess the motivation as well as the relation between the level of patient̀s motivation in relation to disease characteristics, metabolic control, behavioral determinants and the barriers patients encounter in diabetes self-management.

Methods:

The data for this cross-sectional study were obtained by combining anthropometric measurements (body mass index-BMI), biochemical parameters (glycosylated hemoglobin-HbA1c) and by interviewing respondents using certain subscale of a structured Personal Diabetes Questionnaire (PDQ).

Results:

The sample consisted of 117 respondents with T2DM. The majority (61.06%) was not motivated to make self-management changes. Non-motivated respondents were older than 65 years of age (X○2 = 8,046; p = 0.005) and had: a lower level of education (X○2 = 35.320; p = 0.000), diabetes for more than 10 years, poor glyco-regulation (90,14%) and were overweight / obese (81,7%). Motivated respondent were more physically active (X○2 = 6.439; p = 0.000), more adherent to anti-hyperglucemic therapy (OHAs) (X○2 = 9.673; p = 0,002), and more adherent to dietary regime. Average barrier scores: in the following healthy diet [t = -7.960; p = 0.000], in therapeutic adherence [t = -4.318; p = 0.000] and physical activity [t = -6.439; p = 0.000] were also statistically significantly different with the high impact in relation to respondents' motivation.

Conclusions:

Assessment of the motivation for changes in diabetes self-management should become an integral part of monitoring patients with T2DM in Primary Health Care (PHC). In this way, individual advisory strategies could be developed, because motivated and not motivated persons have different needs for counseling.

Key messages:

- Motivated and not motivated persons with T2DM have different needs for counseling.
- Assessment of the motivation for changes in diabetes self-management should become an integral part of monitoring patients with T2DM.

Peer support for socially vulnerable citizens with diabetes: Bridging the gap to the health system

Stine Dandanell Garn

U Christensen[1], *SD Garn*[1,2], *C Glumer*[2]
[1]Section of Social Medicine, Copenhagen University, Copenhagen, Denmark
[2]Center for Diabetes, Copenhagen Municipality, Copenhagen, Denmark
Contact: stineoeienh@gmail.com

Problem:

Despite free universal healthcare, Copenhagen is challenged by inequality in the prevalence and implications of type 2-diabetes (T2D). To address the problem, the Municipality of Copenhagen has initiated a city action plan including a peer support program for socially vulnerable citizens with T2D. Such programs have shown to be an essential supplement to the established health system to reach groups, who have limited contact with the health system. However, research on the implementation of the programs is generally limited.

Description of the problem:

This 6-months peer support program is based on an initial analysis, showing social vulnerability to be associated with co-morbidity, low level of education, unemployment, living in a disadvantaged district and living alone. The peers are matched with a volunteer peer supporter with T2D, who helps out every 14. day with social-, practical- or bridging activities to health services or the municipality.

We aim to evaluate the implementation with focus on contextual factors. We conduct in-depth qualitative interviews with peers (N = 12), peer supporters (N = 12), and relevant stakeholders (N = 6). Further, surveys with the peers and peer supporters (N = 45).

Results:

Our preliminary results indicate how the peer supporters can bridge the gap between socially vulnerable citizens with T2D and the health system. However, contextual factors regarding the recruitment of peers have challenged the implementation process as the municipality has difficulty reaching them.

Lessons:

To ensure a successful implementation, it is important to prioritize resources to ensure good collaboration with local stakeholders, who can be gatekeepers in the recruitment and get in contact with this group of citizens.

Key messages:

- The program has potential to bridge the gap between socially vulnerable citizens and the health system.
- The group is hard to reach without collaboration with local stakeholders.

Trends by gender and predictors of diabetes-related amputations: an Italian regional analysis

Piera Scampoli

P Scampoli[1], *P Di Giovanni*[2], *F Meo*[1], *F Cedrone*[1], *G Di Martino*[1], *T Staniscia*[3]
[1]School of Hygiene and Preventive Medicine, ''G. d'Annunzio'' University of Chieti-Pescara, Chieti, Italy
[2]Department of Pharmacy, ''G. d'Annunzio'' University of Chieti-Pescara, Chieti, Italy
[3]Department of Medicine and Ageing Sciences, ''G. d'Annunzio'' University of Chieti-Pescara, Chieti, Italy
Contact: piera.scampoli@gmail.com

Background:

Lower extremity amputations (LEAs) are common among people with diabetes, resulting in high disability and mortality. Understanding trends in diabetes-related LEAs is important for assessing the quality of care. Aim of this study was to evaluate predictors and time trends in LEAs in a region of Southern Italy, focusing on gender difference.

Methods:

Hospital discharge records were used to identify all diabetic adult patients hospitalized for LEAs between 2006 and 2015. For each year, gender- and age-adjusted standardized hospitalization rates for major and minor amputations were calculated and time trends were analyzed by gender. Predictors of LEAs were estimated by a multivariable regression model.

Results:

In the study period, 579 major and 1345 minor amputations were performed in Abruzzo. Gender- and age-adjusted standardized admission rates decreased for minor amputations among both males (-29.96%) and females (-5.33%), whereas major amputations rates decreased only for males (-44.73%). Males were at higher risk of undergoing major (Rate Ratio [RR] 1.41, 95%CI 1.19-1.67) and minor (RR 1.62, 95%CI 1.45-1.82) amputations, but the male-to-female rate ratio decreased for major and minor amputations. Peripheral vascular disease was the main predictor of major (adjOR 4.09, 95%CI 3.31-5.06) and minor amputations (adjOR 12.90, 95%CI 11.00-

15.12). Age over 85 (adjOR 9.07, 95%CI 1.84-44.71) and more than 3 comorbidities (adjOR 2.51, 95%CI 1.75-3.60) were parameters associated only with major amputations.

Conclusions:

Reducing the number of LEAs represents a healthcare priority. This study emphasizes the existence of gender disparities in LEAs, highlighting a significant reduction of LEAs for males and a lack of improvement for females. Thus, it is worthwhile to investigate potential clinical, behavioral and healthcare-related causes of this difference, in order to plan health system changes aimed at improving care and facilitating access to health care for women.

Key messages:

- Time trends in LEAs showed a substantial improvement only for males, highlighting the existence of gender difference.
- Understanding the underlying causes is essential to improve the quality of care.

Trends in diabetes prevalence, awareness, treatment, control in Yangon, Myanmar between 2004-2014

Wai Phyo Aung

WP Aung[1], E Bjertness[1], H Stigum[1], AS Htet[1], MK Kjøllesdal[1]
[1]Department of Community Medicine and Global Health, University of Oslo, Oslo, Norway
Contact: waiphyoaung77@gmail.com

Background:

In 2004, a survey in Yangon Region was conducted as the first STEP survey in Myanmar, which was repeated in 2014, assessing diabetes prevalence. Whether there have been any changes over time in the awareness, treatment and control status of diabetes is not known. The study aimed to assess changes in the prevalence, awareness, treatment and control of diabetes from 2004 to 2014, among adults in Yangon region.

Methods:

The study was conducted in urban and rural areas of Yangon region, Myanmar, using two cross-sectional household based studies, in accordance with World Health Organization STEPS methodology. Men and women aged 25-74 years old participated in the studies (n = 4448 in 2004) and (n = 1372 in 2014). Logistic and linear regression were performed and outcome variables were diabetes and fasting plasma glucose.

Results:

The overall age-standardized prevalence of diabetes were 8.3% (95% CI 6.5-10.6) in 2004 and 10.2% (7.6-13.6) in 2014 (p = 0.296). The diabetes prevalence increased from 2004 to 2014 only among participants aged $\geq$60 years, from 14.6% (11.7-18.1) to 31.9% (21.1-45.0) (p = 0.009). Awareness of having diabetes increased between 2004 and 2014 (44.3% (39.2, 49.6) to 69.4% (62.9-75.2)) ($p < 0.001$). Among participants who were aware of having diabetes, the proportion under treatment had increased between 2004 and 2014 from 55.1% (46.8-63.1) to 68.6% (61.5-74.8) (p = 0.015). There were no increase between 2004 and 2014 in the proportion of participants with controlled diabetes. After adjustments for age, sex and education, mean fasting plasma glucose levels in 2014 was 0.56 mmol/l (0.26-0.84) higher than in 2004.

Conclusions:

The studies to monitor the development of diabetes prevalence in Myanmar are needed. Preventive measures to halt increases prevalence, to increase the detection rate of undiagnosed DM also treatment rate and to help people with diabetes to control their situation are needed.

Key messages:

- Mean plasma glucose levels were higher in 2014 than in 2004, but an increase in DM prevalence during this period was seen only among the oldest participants.
- The proportion of women being aware of having DM, as well as the proportion under treatment for most groups, had increased, however not the proportion under control.

Prevalence of hypertension and diabetes in Finland by different data sources

Päivikki Koponen

P Koponen[1], J Reinikainen[1], H Tolonen[1], T Laatikainen[1], P Jousilahti[1], S Koskinen[1]
[1]Department of Public Health Solutions, National Institue for Health and Welfare, Helsinki, Finland
Contact: paivikki.koponen@thl.fi

Background:

Population level information on the prevalence of hypertension and diabetes is needed to support planning and evaluation of preventive activities and care. Population based health examination surveys (HES) can provide valid information, but they are time consuming and expensive. Administrative registers on hospitalizations and out-patient visits could provide information faster and at less cost.

The aim of this study is to estimate how comparable prevalence estimates of type 2 diabetes (T2D), hypertension and their combination are based on data from the Finnish national health examination survey (FinHealth 2017) and data from administrative hospital and primary care registers in Finland.

Methods:

Survey data were linked to care registers using personal identity codes. Survey based hypertension was defined as SBP$\geq$140 mmHg or DBP$\geq$90 mmHg or self-reported use of antihypertensive medications; and T2D as HbA1c $\geq$48 mmol/mol or self-reported us of diabetes medications. Corresponding indicators from care registers were: hypertension and T2D as a reason for care or visit or having received prescription for diabetes medication (using ICD-10, ICPC and ATC codes).

Results:

For hypertension, survey data provided the prevalence of 43 % while only 12 % of individuals were identified as hypertensives in the register data. The prevalence of T2D was 9 % in both data sources. The prevalence of having both hypertension and T2D was 7 % based on survey data and 3 % based on register data. Agreement between survey and register data was lower for hypertension (Cohen's kappa 0.23) than for T2D (0.84).

Conclusions:

Register data provided lower prevalence for hypertension than the survey data. For diabetes, similar prevalences were observed. As there are limitations in the coverage of register data more reliable population level information can be obtained from HES.

Key messages:

- Health examination surveys cover persons with undiagnosed problems and conditions omitted in national registers.
- Hypertension and T2D should be monitored with both register and survey data.

Education and hypertension in the CONSTANCES cohort: which factors mediate this association?

Lola Neufcourt

L Neufcourt[1], S Deguen[2], S Bayat[1], M Zins[3,4], O Grimaud[1]
[1]Univ Rennes, EHESP, REPERES – EA 7449, Rennes, France
[2]Department of Social Epidemiology, Institut Pierre Louis d'Epidémiologie et de Santé Publique (UMRS 1136), INSERM, Sorbonne Universités, Université Pierre et Marie Curie, Paris, France
[3]Paris Descartes University, Paris Descartes University, Paris, France
[4]Population-Based Epidemiological Cohorts Unit, UMS 011, INSERM-UVSQ, Paris, France
Contact: lola.neufcourt@ehesp.fr

Background:

Individual socioeconomic characteristics and in particular education have been shown to be strongly associated with hypertension (HTN). Few studies have examined the mechanisms involved in such associations and understanding them would help to reduce the burden of social inequalities. We aimed to investigate whether specific risk factors of HTN intervene as mediators in the association between individual education and HTN in a large sample of French adults.

Methods:

In this cross-sectional analysis, participants are adults aged between 18 and 69 years old recruited to the CONSTANCES cohort over the period 2012-2015. We included behavioral (poor diet, physical inactivity, alcohol consumption), anthropometric (body mass index) and socioeconomic risk factors (income and longest occupation) as potential mediators. Analyses were stratified by sex. Natural direct and indirect effects of education on HTN were estimated using weighted Poisson regression models with inverse odds weighting.

Results:

A total of 62,247 individuals (53% women, mean age 48±13 years) were included. Prevalence of HTN was 37.3% [95%-Confidence Interval (95%-CI) =36.6-38.0] in men and 23.2% [95%-CI = 22.7-23.8] in women. We found a steep educational gradient of HTN in both sexes, larger among young adults in relative terms. Low education was strongly associated with HTN: RRTotal Effect = 1.16 [95%-CI = 1.12-1.21] in men and 1.26 [95%-CI = 1.21-1.32] in women. Behavioral, anthropometric and socioeconomic risk factors accounted for 49% and 32% of the total effect in men and women respectively.

Conclusions:

This study underlines the importance of education in inequalities in HTN and suggests that behavioral, anthropometric and socioeconomic risk factors substantially mediate the association between education and HTN. Future research using longitudinal data should be done to help understand the causal pathway linking education and HTN.

Key messages:

- A strong gradient of decreased prevalence of hypertension with higher individual education is observed in both sexes and in early adulthood, suggesting that prevention should start early.
- Behavioral, anthropometric and socioeconomic characteristics at adulthood substantially mediate the association between education and hypertension.

6.H. Workshop: Quality strategies in European health systems: assessing their nature, use and effectiveness

Organised by: Observatory
Chair persons: Ewout Van Ginneken - Germany, Niek Klazinga - Netherlands
Contact: dimitra.panteli@tu-berlin.de

Quality of care is one of the most frequently quoted principles of health policy, and is currently high up on the agenda of policy-makers at national, European, and international levels. However, the understanding of the term and what it encompasses varies. Many organizations and movements, such as evidence-based medicine, health technology assessment, provider accreditation, clinical practice guidelines and patient safety, play an important role in improving quality of health care. However, this broad field of quality-related initiatives is fragmented, and there is often a lack of awareness about parallel activities because of different labels. Evidence on the effectiveness and cost-effectiveness of different quality strategies is not always readily available for policy-makers, who have to struggle with prioritizing initiatives for investment.

To provide a solid foundation for addressing these challenges, the European Observatory on Health Systems and Policies in collaboration with the OECD has put together a comprehensive study on health care quality, its interpretation and the evidence on different strategies aiming to assure or improve it. Drawing on this 2019 study, the workshop has the following objectives:

(a) Provide an understanding of the multidimensional concept of quality of care and its relation to health system performance as well as a comprehensive framework for looking at different strategies and their potential contribution to improving health care quality;
(b) Introduce key components of international and European governance for quality of care;
(c) Highlight the effectiveness, cost-effectiveness and implementation of selected quality strategies, with a focus on the European context:
(d) Health professional regulation, including education, licensing and registration, continuous professional development and mechanisms to ensure fitness to practice;
(e) External institutional strategies for health care organizations, including accreditation, certification and supervision;
(f) ''Pay for Quality'', wherein financial incentives are paid to providers or professionals for achieving quality-related targets within a specific timeframe.
(g) Discuss and refine lessons learned through audience participation, and identify further areas for research and action.

Key messages:

- Quality of care is a political priority and an important contributor to population health. Within an overall strategic framework, understanding the potential of different quality strategies is key.
- Evidence on the (cost-)effectiveness of different quality strategies is variable but largely inconclu-sive. Maintaining an overview and identifying areas for action is paramount for policy-makers.

Understanding quality of care and analyzing different strategies to assure and improve it

Reinhard Busse

R Busse[1], D Panteli[1], W Quentin[1]
[1]Department of Health Care Management, Berlin University of Technology, Berlin, Germany
Contact: rbusse@tu-berlin.de

Assessing and improving quality of care presupposes an understanding of what it does and does not entail. Different definitions often specify relatively long lists of various attributes that they recognize as part of quality. Effectiveness, patient safety, and responsiveness/patient-centeredness seem to have become universally accepted as core dimensions of quality of care. The inclusion of a list of additional elements is confusing and often blurs the line between quality of care and overall health system performance. This presentation provides an in-depth look at this interplay, recognizing that the definition of quality changes depending on the level at which it is assessed. At the level of health services, there seems to be an emerging consensus that quality of care is the degree to which health services for individuals and populations are effective, safe, and people-centered. On the other hand, a health care system as a whole is of high quality when it achieves the overall goals of improved health, responsiveness, financial protection, and efficiency; here, there seems to be an international trend towards using the term health system performance.

The workshop looks at different strategies to assure or improve the quality of health care. To understand, analyze, compare and ultimately prioritize or align different quality strategies, this presentation will introduce a comprehensive framework, which includes the following lenses: i) the three core dimensions of quality: safety, effectiveness, and patient-centeredness; ii) the four functions of health care: primary prevention, acute care, chronic care, and palliative care; iii) the three main activities of quality strategies: setting standards, monitoring, and assuring improvements; iv) Donabedian's triad: structures, processes, and outcomes; v) the five main targets of quality strategies: health professionals, technologies, provider organizations, patients, and payers.

Key components of international and European governance for quality of care

Willy Palm

W Palm[1], M Peeters[2], P Garel[3], A Daval[4], C Shaw[5]
[1]European Observatory on Health Systems and Policies, Brussels, Belgium
[2]EFTA Surveillance Authority, Brussels, Belgium
[3]European Hospital and Healthcare Federation (HOPE), Brussels, Belgium

Contact: palmw@obs.who.int

The legal status and binding nature of various international governance and guidance instruments to foster and support quality strategies in European countries differs substantially. This presentation introduces and discusses the four main elements of an integrated international governance framework for quality in health care: i) raising political awareness of the relevance of health care quality and creating a common vision on how to improve it; ii) implementing this vision into actual policy frameworks by sharing experience and practice between countries; iii) developing and providing standards and models (voluntary or mandatory) that can be transposed into national policy; iv) measuring, assessing and comparing quality by developing better information, better indicators and methodologies as well as dissemination strategies.

The presentation will also focus on how quality in health care is addressed through EU policy, first through EU provisions and policies that are meant to ensure free movement of citizens and goods and establish an internal market, and by means of more horizontal and generic EU policies on quality and safety that stem from the mandate to support, coordinate or supplement national policies. It will further highlight how EU integration and policy touch upon quality in health care and how the approach has evolved over time.

Regulation of health care professionals as a quality strategy

Dimitra Panteli

D Panteli[1], A Kreutzberg[1], C Reichebner[1], C Maier[1], F Destrebecq[2]
[1]Department of Health Care Management, Berlin University of Technology, Berlin, Germany
[2]European Brain Council, Brussels, Belgium
Contact: dimitra.panteli@tu-berlin.de

Health professionals are both a health system input and an active component of the functions that the health system performs. As such, the performance of the health workforce is directly linked to the quality of health services. Regulation is essential to define a clear framework within which health professionals acquire and maintain the competence needed to provide health services that are of high quality, i.e. that are safe, effective and patient-centered. This presentation discusses the evidence on a sequence of strategies that regulate health professionals, looking at how they are currently deployed in Europe, how (cost-)effective they are, and what can be done to optimize their implementation.

Adopting a comprehensive perspective ranging from the entry into training to life-long maintenance and demonstration of competence, the presentation brings together a) strategies to develop professional competence (including training structure and contents, curriculum development and the accreditation of institutions for health education); b) strategies that regulate the entry of physicians and nurses into their professions (e.g. licensing and registration); c) mechanisms to maintain competence (e.g. continuing professional development); and d) levers to address instances when fitness to practice comes into question.

External institutional strategies for health care organizations as a quality strategy

Elke Berger

E Berger[1], O Groene[2], C Shaw[3]
[1]Department of Health Care Management, Berlin University of Technology, Berlin, Germany
[2]Optimedis, Hamburg, Germany
[3]Independent Adviser, Houghton, UK
Contact: elke.berger@tu-berlin.de

Accreditation, certification and supervision are quality strategies that intend to encourage the compliance of health care organizations with published standards through external assessment. The idea is that health care organizations will increase compliance with standards in advance of a planned external inspection. Despite several common characteristics of the three strategies, their origins and initial objectives differ. This presentation aims to disambiguate these concepts, inform on their utilization in European countries and discuss the evidence on their effectiveness, cost-effectiveness and implementation.

External assessment strategies have been widely implemented in Europe. Most countries make use of several strategies, including basic supervision as part of the licensing process for healthcare providers, coupled with certification or accreditation strategies to ensure and improve the quality of care. The scope of these strategies and their regulation differs substantially between countries. Despite this widespread uptake, there is little robust evidence to support their effectiveness and there is a complete absence of evidence on cost-effectiveness. Furthermore, due to the broad purpose range of external assessments and the lack of consensus in the use of terminology, implementation strategies are sparse or missing. However, this presentation highlights several facilitators and barriers that may affect the implementation of external assessment strategies in health care organizations as well as relevant insights for policy-makers.

"Pay for Quality" (P4Q) as a quality strategy

Wilm Quentin

W Quentin[1], H Eckhardt[1], P Smith[2]
[1]Department of Health Care Management, Berlin University of Technology, Berlin, Germany
[2]Emeritus, Imperial College London, London, UK
Contact: wilm.quentin@tu-berlin.de

P4Q can be implemented in various health care settings, targeting a range of health care providers or professionals. P4Q schemes can reward high quality measured in terms of structures, processes, and/or outcomes, and/or penalise low quality and are implementable in line with other quality improvement interventions. This presentation aims to clarify the concept of P4Q, highlight the use of P4Q schemes in different settings in European countries, and systematize the evidence on the effectiveness, cost-effectiveness and implementation of P4Q as a quality strategy.

We could identify fourteen primary care P4Q programmes and thirteen hospital P4Q programmes in a total of 16 European countries. P4Q schemes in primary care incentivise mostly process and structural quality with respect to prevention and chronic care. P4Q schemes in hospital care prioritize improvements in health outcomes and patient safety. Studies suggest small positive effects on process-of-care (POC) indicators in primary care but not in hospital care. Evidence on health outcomes and patient safety indicators is inconclusive. Cost-effectiveness is unlikely because of lacking effectiveness. P4Q schemes are more effective when the focus of a scheme is on areas of quality where change is needed and if the scheme embraces a more comprehensive approach, covering many different areas of care; however, such programmes are generally technically and politically difficult to implement. In this light, this presentation will conclude with a number of recommendations, both technical and policy-oriented.

6.I. Vaccination policy and infectious diseases

Increasing HPV vaccination uptake among adolescents: A Systematic Review

Chiara de Waure

A Acampora[1], *A Grossi*[1], *A Barbara*[1], *V Colamesta*[1,2], *FA Causio*[1], *GE Calabrò*[1], *S Boccia*[1], *C De Waure*[3]
[1]Institute of Public Health, Catholic University of Sacred Heart, Rome, Italy
[2]UOC Direzione Sanitaria S. Spirito e Nuovo Regina Margherita, Local Health Unit ASL RM1, Rome, Italy
[3]Department of Experimental Medicine, University of Perugia, Perugia, Italy
Contact: chiara.dewaure@unipg.it

Background:

Human Papillomavirus (HPV) is responsible for the development of several pathologies besides the cervical cancer and HPV vaccination is a key strategy for primary prevention. The aim of this research was to identify strategies adopted to increase HPV vaccination coverage among the adolescents.

Methods:

A systematic review was carried-out by searching electronic databases (Pubmed, Scopus, and Web of Science) using selected keywords as ‘‘papillomavirus vaccine’’, ‘‘vaccination strategy’’ and ‘‘efficacy’’. Articles conducted in high-income countries and evaluating the impact of one or more strategies on vaccination coverage (initiation e/o completion) in adolescents were included.

Results:

Out of 3571 single citations screened, 42 papers (2011-2018) were included. Study size ranged from 50 to 325229 individuals. The major part of the studies was from the United States (n = 35; 83,3%) and conducted with an experimental design (n = 17; 40,5%). The evaluated outcomes included first dose uptake, schedule completion, vaccination timeliness and the number of administered doses. Identified strategies included reminds (9), education activities (9), multicomponent strategies (22) and others (2) and were focused on adolescents/parents and/or healthcare providers. Significant positive results were reported in seven studies (77,8%) evaluating the impact of reminds, four studies (44,4%) on education strategies, and in 12 studies (54,5%) on multicomponent strategies. Offering vaccination in ‘‘bundle’’ or during any medical visit was also reported as significantly effective.

Conclusions:

Increasing the vaccination coverage is essential to achieve HPV-related diseases control. Several types of strategies are available and showed a positive impact on vaccination uptake, in particular those relied on reminds. Nonetheless, the heterogeneity of interventions suggests the importance to adapt such initiatives to the specific context in order to maximize the improvement in vaccination uptake.

Key messages:

- Several types of strategies to increase vaccination uptake are available at international level and showed a positive impact among adolescents.
- These interventions are heterogeneous suggesting the importance of their adaptation to the specific context in order to gain the maximum improvement in vaccination uptake.

Knowledge and attitudes about Human Papillomavirus and its prevention in Italian students, 2018

Federico Romanese

F Romanese[1], *L Brunelli*[1], *G Bravo*[1], *M Righini*[1], *L Lesa*[2], *A De Odorico*[1], *S Miceli*[2], *S Pascut*[3], *E Bastiani*[3], *S Brusaferro*[1,2]
[1]Department of Medicine, University of Udine, Udine, Italy
[2]Udine Healthcare and University Integrated Trust, Udine, Italy
[3]Healthy Cities Project, Municipality of Udine, Udine, Italy
Contact: federico.romanese@uniud.it

Background:

Human Papillomavirus (HPV) infections show an estimated prevalence of 290 millions of cases worldwide, being the most common viral infection related to the reproductive tract and the main cause of cervical cancer. Being HPV vaccination currently recommended for both genders, we assessed knowledge and attitudes regarding HPV prevention among high school students in Udine, Northern Italy.

Methods:

Between April and May 2018, a sexual and reproductive health anonymous questionnaire was proposed to first-year students in five academic, technical and vocational upper secondary schools of Udine. In particular, students were asked about HPV related diseases, whether they were vaccinated against HPV and how that decision was taken. Data were analyzed by school type and gender using Chi Square Test with $\alpha = 0.05$.

Results:

A total of 747 questionnaires were collected from 990 students; both genders had a mean age of 14.8 ± 0.9 years, 59% of respondents were males. Technical high school students were 42% of the sample, while 30% came from vocational and 28% from academic high schools. Genital warts and cervical cancer were identified as HPV-related by 8% and 20% of students respectively, the latter more frequently in technical institutes ($p = 0.0016$) and in females (43% vs 13%, $p < 0.001$). Almost 54% of students did not know if they were immunized against HPV; academic school students and females declared more frequently to have received at least one vaccine dose compared to others ($p < 0.001$). Almost two thirds of respondents reported to have undergone vaccination due to a parental decision; parents discussed this choice more frequently with academic students ($p = 0.0016$) and females (22% vs 14%, $p < 0.001$).

Conclusions:

Girls and technical school students are more informed about HPV, while adherence to immunization schedules is higher in females and those attending academic school. Parents appear to create a supportive environment for females.

Key messages:

- The different level of knowledge by gender can be explained by past vaccination campaigns, mainly focused on girls, and by parental proactivity towards females.
- There is room for improvement in HPV-related knowledge and prevention among both adolescents in general and males in particular as they can play an important role to reduce the burden of HPV.

Awareness of HPV and drivers of HPV vaccine uptake among university students in Italy

Marco Fonzo

T Baldovin[1], S Cocchio[1], M Fonzo[1], SE Bennici[1], A Buja[1], C Bertoncello[1], V Baldo[1]
[1]Hygiene and Public Health Unit, DCTV, University of Padova, Padova, Italy
Contact: marco.fonzo@studenti.unipd.it

HPV vaccination is a milestone in primary prevention. However in Italy, vaccine coverage is still nowhere near the target of 95%. We investigated drivers of vaccine uptake among university students, as they are likely to have just assumed a central role in their healthcare decision-making and potential barriers may differ from parents.

University students aged 18-25 were asked to fill in a questionnaire. The effect of socio-demographic and behavioural characteristics on HPV awareness was assessed with a logistic regression adjusting for age, gender, nationality, degree course, relationship, age at first intercourse, number of sexual partners, smoking, sexual orientation, past diagnosis of STDs and knowledge of people who had received HPV vaccine. A second regression adjusting also for information sources, awareness and knowledge investigated drivers of vaccine uptake.

9,988 questionnaires were included; awareness of HPV and vaccine was 83.3% and 69.9%, respectively. Awareness (adjOR: 3.3 95%CI 2.3-4.6) and a good knowledge positively affected acceptability, as well as a previous diagnosis of STDs and knowledge of vaccinated people. Healthcare workers (adjOR 1.6 95%CI 1.4-1.9) and family members (adjOR 1.7 95%CI 1.4-2.1) were the most influencing information sources, even if knowledge of vaccinated people was by far more persuasive (adjOR 2.7 95%CI 2.2-3.3). Only 12% of participants were acquainted with skin to skin HPV transmission, while 75% believed in a full effectiveness of condom; less than 22% associated HPV with cancer (other than cervical cancer).

Efforts to increase awareness are likely to be worth considering that: awareness is the main determinant of vaccine uptake; only 50% of individuals not interested in receiving vaccine were aware of it; males are much less aware (adjOR 0.09 95%CI 0.07-0.11). Moreover, this study spotlights some misconceptions and may provide suitable evidence in tailoring more efficacious communication strategies.

Key messages:

- There is room for improving the awareness of HPV. Efforts are likely to be worth since it remains the main determinant of vaccine uptake. Awareness has been growing but a gender gap still persists.
- Communication should focus more on HPV involvement in neoplasia other than cervical cancer; transmission via skin to skin contact; multiple sex partnership; partial protection of condom.

Determinants of the intention to vaccinate with MMR among pregnant women from the City of Rome

Annalisa Rosso

A Rosso[1,2], A Massimi[1], V Baccolini[1], E Pitini[1], C Marzuillo[1], C De Vito[1], P Villari[1]
[1]Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy
[2]Azienda Sanitaria Locale Roma 2, Rome, Italy
Contact: annalisa.rosso@uniroma1.it

Background:

Further to the increase in measles cases reported in Italy since 2016, MMR vaccination became mandatory in 2017, leading to an increase in vaccination coverage in the Country. To guarantee sustained coverage, factors influencing the intention to vaccinate in the population should be better understood.

Methods:

We conducted a cross-sectional survey to assess knowledge and attitudes on pediatric vaccinations and intention to vaccinate among pregnant women attending Antenatal Classes in Rome, through distribution of a self-administered questionnaire, which included a specific section on MMR vaccination. Multiple logistic regression analysis was performed to analyze the determinants of the intention to vaccinate with MMR.

Results:

A total of 458 pregnant women attending CANs in 36 family health centers and two hospitals answered the survey. Intention to vaccinate with MMR was associated with having received information from a healthcare professional (OR 1.92, 95%CI 1.01-3.63), the perceived importance of vaccines to protect against measles (OR 4.68, 95%CI 2.48- 9.54) and rubella (OR 5.97, 95%CI 2.98-11.95), not believing in news about the risks of MMR vaccine (OR 2.75, 95%CI 1.38-5.50), and the sense of guilt in case the child should contract the disease (OR 2.56, 95%CI 1.16-5.62). Factors negatively associated with the intention to vaccinate were the use of alternative medicine (OR 0.34, 95%CI 0.16- 0.76), believing that MMR vaccine can have serious side effects (OR 0.37, 95%CI 0.00-0.29) and guilt in case of serious side effects (OR 0.40, 95%CI 0.21-0.76).

Conclusions:

Fear of MMR side effects is a relevant driver of the intention to vaccinate, coupled with the perceived importance to vaccinate to protect against measles and rubella. Also the source of information plays an important role in shaping ideas on vaccines. Information and communication strategies should be promoted to increase trust in vaccines, with a direct involvement of healthcare workers.

Key messages:

- Fear of MMR side effects and perceived benefits of the vaccine influence the intention to vaccinate.
- Information and communication strategies to increase vaccination appectance involving healthcare workers are needed.

Measles outbreak at the Val Thorens ski station, France, 2019

Elise Brottet

E Brottet[1], AS Ronnaux-Baron[2], N Grangeret[3], M Deher[3], B Andrivot[1], E Fougere[1]
[1]Regional Office, Santé Publique France, Lyon, France
[2]Public Health Department, Agence Régionale de Santé Auvergne-Rhône-Alpes, Lyon, France
[3]Public Health Department, Agence Régionale de Santé Auvergne-Rhône-Alpes, Chambéry, France
Contact: elise.brottet@santepubliquefrance.fr

During the 2019 winter season, a measles outbreak occurred at the Val Thorens ski station in France, in an area frequented by over 300,000 holiday-makers (70% foreigners) and 2,500 seasonal workers.

Between 24/01/2019 and 15/04/2019, 55 cases were reported (18 confirmed and 37 clinical). Apart from 5 infected children under 2 years old attending the same nursery, cases were mainly seasonal workers between 19 and 41 years old. Five cases were hospitalised, one with severe pneumonia. Of the 36 cases with known vaccination status, 25 (69%) had not completed 2-dose vaccination. Other confirmed cases in visitors to Val Thorens were reported in neighbouring valleys (n = 3), and in other French regions. One case was reported the French overseas territory Guadeloupe (WHO 'Americas' region where measles has been eradicated). British, Belgian, Danish, Dutch and Irish authorities reported 7 cases in people who had stayed in the area. The list of exported cases is non-exhaustive.

The regional health agency (ARS) provided increased information on epidemic risk and vaccination recommendations, particularly to health professionals and the town council. Identifying all contacts was difficult because many had occurred with seasonal workers. In addition to the approximately 150 vaccinations carried out by the Val Thorens medical centre from the start of the outbreak, only 41 other people were vaccinated in 5 free vaccination sessions organized in situ by the ARS, and the local medical and immunization centres.

The large attendance at the station favoured the outbreak and its extension in France and abroad. Due to low measles vaccine coverage in France (80.3% for 2-dose cover in 2 years in 2017), outbreaks in non-vaccinated and not fully vaccinated populations are increasing, as seen in Val Thorens.

Key messages:

- A major measles epidemic occurring in an undervaccinated population in frequent contact with tourists, led to the extension of cases in France and Europe.
- Despite 5 free in situ vaccination sessions, with the mobilisation of local health professionals, few seasonal workers came to be vaccinated.

Measles outbreak in a public hospital, Szczecin, Poland, January 2019

Cyrus Alain Koenig

C Koenig[1,3], O Wojtynska[2], I Paradowska-Stankiewicz[3]
[1]EPIET, ECDC, Stockholm, Sweden
[2]Zaklad Epidemiologii, Powiatowa Stacja Sanitarno-Epidemiologiczna w Szczecinie (PSSE), Szczecin, Poland
[3]Zaklad epidemiologii, Narodowy Instytut Zdrowia Publicznego - Panstwowy Zaklad Higieny (NIZP-PZH), Warsaw, Poland
Contact: cyrus.koenig@gmail.com

Background:

In January 2019, a measles infection in an employee in a 168-bed hospital was reported to the local sanitary station (PSSE) in Szczecin, Poland. Further transmission occurred in the hospital and more cases were reported in the community. We investigated to identify transmission routes and implement control measures.

Methods:

An outbreak case was any hospital staff, visitor, or patient, or any person in contact with them, meeting clinical criteria, from 3rd January. Cases were interviewed by PSSE to identify contacts and verify vaccination status. Susceptible contacts were offered post exposure vaccination (PEV). Clinical specimens were sent to the National Reference Laboratory for RT-PCR and serology confirmation. We collected vaccination status, geographical location and queried hospital authorities about control measures.

Results:

The index case, the hospital employee, returned from Ukraine one day before onset of symptoms. We identified 17 (8 confirmed, 7 probable, 2 suspect) outbreak cases including 11 hospital personnel. Four of the personnel provided vaccine documentation (36%), of which three had received 2 doses. Contacts identified as susceptible (130) received PEV. Eight cases were contacts of the index case but were not promptly identified and did not receive PEV. The hospital refused new admissions for 19 days.

Another 16 cases were identified in the community, with exposure information not sufficient to establish an epidemiologic link with the outbreak.

Conclusions:

The introduction of measles into a susceptible population and missing contacts for PEV led to a hospital-associated outbreak. For the community cases, exposure may have occurred in multiple public spaces around the hospital.

Most of the hospital staff who developed measles lacked vaccination records. The PSSE has recommended MMR vaccination for all hospital personnel without such documentation.

Key messages:

- This study shows how a single imported case, in an environment poorly immunized could lead to an outbreak and potentially transmit it to the community.
- It is very important to keep a high rate of measles vaccination (95% recommended by WHO) in the community and insure of immunization status of health workers.

Screening for tuberculosis among newly arrived migrants in France. Results from a practice study

Nicolas Vignier

L Luan[1,2], C Charlois[3], H Leroy[4], H Cordel[5], J Figoni[5], F Méchai[5], M Lachatre[6], M Mechain[7], N Vignier[1,8]

[2]DES de Santé Publique, Paris University, Paris, France
[3]CLAT 75, DASES, Paris, France
[4]Pôle Tuberculose, Réseau Louis Guilloux, Rennes, France
[5]Department of Infectious and Tropical Diseases, Avicenne Hospital, Bobigny, France
[6]Department of Vaccinology, Cochin Hospital, Paris, France
[7]Bordeaux University Hospital, Bordeaux University Hospital, Bordeaux, France
[8]Institut Pierre Louis d'Épidémiologie et de Santé Publique, Sorbonne University, Paris, France
Contact: vigniernicolas@yahoo.fr

Background:

Screening of active and latent tuberculosis among migrants is a public health concern but physicians' practices are poorly known. The study aimed to evaluate physicians' practices in France.

Methods:

A national survey of physicians' practices about infectious diseases prevention among migrants was conducted in 2017-2018 and broadcasted by several scientific societies.

Results:

In total, 367 physicians answered; 53.1% were primary care physicians, 34.3% "TB involved physicians", and 85.5% were involved daily with migrants. Screening by chest X ray is recommended by 84.8%, 71.9% and 38.4% of participants for migrants from high- (>100 cases/100,000 p.a.), medium- (> 50/100,000), and low-incidence countries respectively. One physician in two declares considering migration conditions in his/her decision of screening migrants from low incidence countries. Primary care physicians are less likely to offer screening (aOR = 0.21[0.09-0.48], $p < 0.001$). About screening prescription, only 55.6% consider it their responsibility. TB control centres are designated by 56.7% of respondents. Concerning screening for latent tuberculosis infection (LTBI), 61.8% and 34.0% offered screening for children under the age of 15 and for all migrants (adults and children) from high incidence countries respectively; physicians working in Paris and its region being less likely to offer it (aOR = 0.45 [0.28-0.71], $p = 0.001$ and aOR = 0.43 [0.27-0.69] $p = 0.001$ respectively). Among those screening children, 88.1% recommend treatment if facing a positive result, most often with a 3-month isoniazid rifampicin double therapy, and 11.4% offer follow up alone.

Conclusions:

Physicians' practices in France regarding screening of tuberculosis among migrants are heterogeneous. Which population should be targeted for LTBI screening remains unclear in the context of contradictory national and international recommendations. The results of our study raise the issue of knowledge, and adherence to these guidelines.

Key messages:

- Physicians' practices in France concerning active and latent tuberculosis screening among newly arrived migrants are heterogeneous.
- Many physicians involved in migrants' care ignore or do not adhere to current national guidelines, especially concerning LTBI screening among newly arrived migrants.

HCV test&treat in Milan prisons-an effective strategy for microelimination and health gaps reduction

Lara Tavoschi

V Casigliani[1], R Giuliani[2], T Sebastiani[2], G Arzilli[1], G Scardina[1], L Tavoschi[1], R Ranieri[2]
[1]Translational Research and New Technologies in Medicine, University of Pisa, Pisa, Italy
[2]Penitentiary Health System, San Paolo University Hospital, Milan, Italy
Contact: lara.tavoschi@unipi.it

Background:

People in prison represent a high-risk population for HCV infection control due the overrepresentation of people with a history of intravenous drug use, psychiatric patients and other vulnerable populations who have often reduced access to healthcare. With the advent of new direct antiviral agents (DAAs) HCV micro-elimination in prison setting became a feasible strategy.

Methods:
We conducted in 2017 and 2018 a cross-sectional evaluation of HCV treatment cascade in one detention prison, Opera (OP), and one pre-trial detention center, San Vittore (SV) in Milan. A dedicated protocol for HCV eligibility and care was applied. We collected data on demographics, HCV testing and treatment on all inmates on October 31st 2017 and 2018. Data collection ended on December 31st of each year.

Results:
On October 31st 2017, 2366 inmates were living in the two facilities, 2369 in 2018, of these, 1036 (43,7%) were already present in 2017 (71,3% in OP; 28,7% in SV). In both years the majority were men (95.4%; 96,4%) with a median age of 41 years and Italians (57%; 61,9%). Prevalence of reported drug use remained high (46,5%; 44,2%). HCV screening coverage was 89% in both years, while HCV-RNA test coverage increased (90,6%; 99%). HCV Ab+ was stable (212, 10.1%; 194, 9,2%). At the end of 2017 and 2018, 106 (50%) and 117 (60,3%) started treatment eligibility process of which 90 (42,4%) and 106 (54,6%) completed DAAs in prison. Considering last available viremia, 41 inmates (19,3%) were viremic in 2017 (OP 16.1%; SV 24,4%), while only 13 inmates (6,7%) in 2018 (OP < 1%, SV 15,4%). On December 31st 2018, among HCV Ab+ detainees 122 (62,9%) were never linked to care before incarceration.

Conclusions:
Our study shows the success of the HCV testing and treatment strategy to achieve HCV micro-elimination in a prison setting with a significant drop in the pool of viremic individuals. We highlight how prison health care may represent a unique point of access for vulnerable population.

Key messages:
- HCV micro-elimination is a feasible and effective strategy in prison settings.
- High-quality healthcare in prison contributes to reduce health gaps and improve access for socially deprived population.

6.K. Workshop: Addressing the mental health needs of lesbian, gay, bisexual, and transgender populations

Organised by: EUPHA (SGMH)
Chair persons: John Pachankis - USA, Arjan Van Der Star - EUPHA (SGMH)
Contact: richard.branstrom@ki.se

Today a large number of studies from different parts of the world clearly show that compared with heterosexuals lesbian, gay, bisexual, and transgender (LGBT) individuals have an increased risk of mental health problems, especially depression, anxiety and suicidal behaviour. To meet this increased risk of mental health problems, many governmental public health agencies call for policy and intervention programs addressing specific needs of LGBT individuals. Despite the clear need for evidence-based care, prevention, and treatment specifically tailored to LGBTQ people, there are currently few such programmes due to lack of sufficient research.

This workshop will give examples of studies on mental health care needs among LGBT individuals and effect of evidence-based training for mental health providers, as well as, studies showing improvements of mental health after treatments. Dr. Corina Lelutiu-Weinberger (Rutgers University, USA) will present results from a newly conducted study of LGBT-affirmative mental health training for health care providers in Romania. Dr. John Pachankis (Yale University, USA), will present results showing improvements in mental health among transgender individuals after receiving gender-affirmative surgical treatment, using a total population dataset from Sweden. Dr. Igor Grabovac (Medical University of Vienna, Austria) will present health and well-being disparities based on sexual orientation among older LGBT individuals in England. The situation for LGBT individuals varies greatly across Europe. The level of acceptance for minority sexual orientations differs greatly by country, and in many countries, LGBT people are also subject to legal discrimination concerning basic civil rights, e.g. regarding recognition of same-sex unions. During the workshop, Dr. Richard Bränström (Karolinska Institutet, Sweden) will present data on experiences of discrimination in health care settings and openness with sexual and gender identity to mental health providers among LGBT populations across all 28 European Union Countries.

Key messages:
- Today a large number of studies from different parts of the world clearly show that compared to heterosexuals LGBT individuals have an increased risk of mental health problems.
- Access to supportive mental health care for LGBT individuals varies greatly across Europe and dissemination of targeted LGBT-affirmative evidence-based interventions needed.

Web-based training and supervision for LGBT-affirmative mental health practice: A randomized controlled trial

Corina Lelutiu-Weinberger

C Lelutiu-Weinberger[1], JE Pacjankis[2]
[1]Rutgers Biomedical and Health Sciences, Rutgers University, Newark, USA
[2]Department of Social and Behavioral Sciences, Yale School of Public Health, New Haven, USA
Contact: cl1148@sn.rutgers.edu

Background:
Lesbian, gay, bisexual, and transgender (LGBT) individuals in most countries remain stigmatized, requiring culturally sensitive mental health care to foster coping and resilience. This trial tested the efficacy of an LGBT-affirmative mental health training for psychologists and psychiatrists in Romania, where such resources are scarce. The trial compared in-person and web-based training modalities.

Methods:
Participants were randomized to a 2-day training either in-person ($n = 56$) or via web by viewing the live-streamed training ($n = 54$), and assessed pre- and 5-, 10- and 15-months post-training, with optional monthly web-based supervision ($n = 47$) after the first follow-up. Generalized linear mixed models were conducted to assess for change across time.

Results:
The sample (M age = 34.98) was mostly female (88%) and heterosexual (84%). Trainees, regardless of in-person or web-based attendance, reported significant decreases from baseline to 15-month follow-up in explicitly ($b = 0.21$, 95% CI $0.06 - 0.37$, $p < 0.01$) and implicitly ($b = 0.26$, 95% CI $0.10 - 0.41$, $p < 0.001$) assessed homonegativity, and significant increases in LGBT-affirmative clinical skills ($b = -1.19$, 95% CI $-1.41 - -1.00$, $p < 0.001$), beliefs ($b = -0.17$, 95% CI $-0.31 - -0.03$, $p < 0.05$) and behavior ($b = -1.17$, 95% CI $-1.72 - -0.61$, $p < 0.05$).

Conclusions:

Training in LGBT-affirmative mental health can change provider attitudes and practice in high-stigma countries. The fact that web-based trainings were equally efficacious as in-person trainings suggests that such education can have widespread reach. As LGBT individuals represent one of the highest-risk global populations for mental health problems driven by stigma, findings hold strong public health potential. Future research should assess the impact of such trainings across high-need settings and include patient outcomes.

Reduction in mental health treatment utilization among transgender individuals after gender-affirming surgeries: A total population study

Richard Bränström

R Bränström[1], *JE Pachankis*[2]
[1]Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
[2]Department of Social and Behavioral Sciences, Yale School of Public Health, New Haven, USA
Contact: richard.branstrom@ki.se

Background:

Despite professional recommendations to consider gender-affirming hormonal and surgical interventions for transgender individuals with gender dysphoria, the long-term effect of such interventions on mental health is largely unknown. This study aims to ascertain the prevalence of mood and anxiety disorder healthcare visits and antidepressant and anxiolytic prescriptions in 2015 as a function of gender dysphoria diagnosis and gender-affirming medical treatment in the entire Swedish population.

Methods:

This study used the Swedish Total Population Register (n = 9,747,324), linked to the National Patient Register and Prescribed Drug Register. Among those who received a gender dysphoria diagnosis between 2005 and 2015 (n = 2,679), mental health treatment in 2015 was examined as a function of length of time since gender-affirming medical treatment. The main outcome measure was mood and anxiety disorder healthcare visits and antidepressant and anxiolytic prescriptions.

Results:

Compared to the general population, individuals diagnosed with gender dysphoria were about six times as likely to have had a mood and anxiety disorder healthcare visit and more than three times as likely to have been prescribed antidepressants and anxiolytics. Years since initiating hormones was not significantly related to likelihood of mental health treatment (AOR: 1.01; 95% CI: 0.98, 1.03). However, increased time since last gender-affirming surgery was associated with reduced mental health treatment (AOR: 0.92; 95% CI: 0.87, 0.98).

Conclusions:

In this first total population study of transgender individuals diagnosed with gender dysphoria, the longitudinal association between gender-affirming surgery and reduced likelihood of mental health treatment lends support to the decision to provide gender-affirming surgeries to transgender individuals who seek them.

Main messages: This study lends support to the decision to provide gender-affirming surgeries to transgender individuals who seek them.

Well Being of Older Gay and Bisexual Men and Women in England: Results of a Cross-Sectional Population Based Study

Igor Grabovac

Contact: igor.grabovac@meduniwien.ac.at

Background:

Lesbian, gay, and bisexual (LGB) older people are an under-represented population in research, with limited research noting more depression, loneliness, rejection, overall poorer health and well-being outcomes. Our study compared well-being, defined as quality of life (QOL), life satisfaction, sexual satisfaction, and depression, among LGB people with their heterosexual peers'.

Methods:

Cross-sectional data from the English Longitudinal Study of Aging, collected 2012-2013. A total of 5691 participants were included in the analysis, with 326 (5.7%) self-identifying as LGB. We used CASP-19 questionnaire for well-being; the Satisfaction with Life Scale for life satisfaction; and the Center for Epidemiologic Studies Depression Scale for depressive symptoms. The question "During the past three months, how satisfied have you been with your overall sex life?" was used for sexual satisfaction. T-test and chi-square tests were used for differences in sociodemographic characteristics between LGB and heterosexual participants. Regression models were used to test associations between sexual orientation and well-being outcomes.

Results:

LGB participants reported significantly lower mean quality of life and life satisfaction, and had significantly lower odds of reporting satisfaction with their overall sex life and higher odds of reporting depressive symptoms in unadjusted models. After adjustment for sociodemographic and health-related covariates, there remained significant differences between groups in mean QOL scores (B = -0.96, 95% [CI] -1.87 to -0.06) and odds of sexual satisfaction (OR = 0.56, 95% CI 0.38-0.82).

Conclusions:

LGB older people report lower quality of life and lower sexual satisfaction than their heterosexual counterparts, possibly associated with experiencing lifelong social discrimination.

Main message: Older lesbian, gay and bisexual people in England report significantly lower QOL and sexual satisfaction in comparison to heterosexual counterparts.

The role of country-level structural stigma on sexual orientation disclosure and discrimination in health care settings among lesbian, gay, and bisexuals across Europe

John Pachankis

R Bränström[1], *JE Pachankis*[2]
[1]Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
[2]Department of Social and Behavioral Sciences, Yale School of Public Health, New Haven, USA
Contact: john.pachankis@yale.edu

Background:

The national climate surrounding sexual minorities (i.e., those self-identifying as lesbian, gay, or bisexual [LGB]) varies greatly worldwide. Recent Cross-European studies have shown that country-level structural stigma is a strong determinant of sexual minority individuals health risk behaviors and mental health. The consequences of the significant country-level variation in structural stigma on sexual minorities' experiences of health care discrimination and disclosure of sexual orientation to health care providers have not been previously investigated.

Methods:

In 2012, 86 000 sexual minority individuals (aged 18 years and older) from all 28 European Union countries responded to questions concerning discrimination in health care settings and sexual orientation disclosure to health care providers (EU LGBT survey). Structural stigma was assessed using a combination of national laws and policies affecting sexual minorities and a measure of sexual minority acceptance among citizens of each country.

Results:

Disclosure of sexual orientation to health care providers were much more common in low stigma coutries (e.g., the Netherlands, Sweden, UK) compared to high stigma coutries (e.g., Lithuania, Latvia, Slovakia). Experiences of discrimination in health care settings were more common among LGB indiviudals who were open about their sexual orientaiton and increased by degree of country-level structural stigma.

Conclusions:

Disclosure of sexual orientation and experiences of discrimination in health care settings varies greatly among LGB individuals in Europe largely due to structural stigma surrounding sexual minorities.

Main messages:

These findings highlight the importance of eliminating legislation, policies, and national attitudes that promote the unequal treatment of sexual minorities in currently unsupportive European countries.

6.L. Round table: Substance use disorders (SUD)

Organised by: EUPHA (PMH)
Chair persons: Jutta Lindert – EUPHA (PMH), Martin McKee - UK
Contact: jutta.lindert@hs-emden-leer.de

Substance use disorders are among the priority conditions identified by the World Health Organization mental health gap action program. The health community has taken a range of (non-exclusive) positions on how to respond to them. These include a spectrum from prohibition, through regulation, to harm reduction and another from individually targeted measures to collective policies. Which measures are adopted depend on many factors outside the health system, including beliefs about the relationship between the individual and the state, the power of producer interests (tobacco/ alcohol industries), and the predominant public narrative. In contrast, a public health approach would focus on the risks of harm, to the individual and society, its distribution within the population, and the potential for unintended consequences. In this workshop, we will explore policy responses to four harmful substances, in four different European countries. These are electronic cigarettes (Martin McKee), cannabis (Jean-Pierre Couteron) illegal drugs (Henrique Barros) and alcohol (Jutta Lindert).

First, the case of electronic cigarettes have divided the health community. While some groups, mainly in England, have embraced them, others have expressed concerns, with US authorities describing their increasing use by adolescents as a public health emergency. We will ask why these different views exist, exploring the use of different paradigms, the prioritization of different population groups and conditions, and the role of cognitive biases. This presentation will highlight some of the wider divisions in approaches to substance use disorders. Second, the use of cannabis in France will be presented. France ranks fourth in the European Union in terms of monthly consumption of cannabis and second only to Denmark in terms of persons who have ever used cannabis. As of November 2018 the penalty for possession of cannabis in France was reduced to a €200 fine. This presentation will discuss the rationale for and expectations of this policy. Third, we will focus on Portugal which, in 2001, became the first country to decriminalise the possession and consumption of all illicit substances. Rather than being arrested, those caught with a personal supply are given a small fine or told to appear before a local commission. Finally, the challenges for Public health of harmful alcohol use will be presented. The harmful use of alcohol creates a serious health burden in refugees. Germany has among the highest alcohol consumptions in Europe, after Luxembourg, is the European country with the lowest percentage of people who abstain from drinking. Alcohol is widely accepted. This creates challenges for refugees coming from countries with much more restrictive approaches to alcohol. This presentation will explore the challenges that arise when a population coming from a regulated environment move to one that is highly liberalised, including a discussion of the challenges in developing culturally appropriate public health responses.

Key messages:

- Substance use is a major public health challenges.
- Legal and policy responses differ widely in the European Union - evidence based policies are highly beeded.

6.M. Health behaviours

Healthy behaviours and risk of all-cause mortality

Jouni Lahti

J Lahti[1], *E Mauramo*[1], *E Lahelma*[1], *T Lallukka*[1], *O Pietiläinen*[1], *J Salmela*[1], *A Salonsalmi*[1], *O Rahkonen*[1]
[1]Department of Public Health, University of Helsinki, Helsinki, Finland
Contact: jouni.mm.lahti@helsinki.fi

Introduction:

Healthy behaviours are associated with better health in general but less is known about the combined associations of multiple healthy behaviours with mortality risk. We aimed to examine the associations of combined healthy behaviours with mortality risk over a 15-year follow-up among middle-aged employees.

Methods:

Survey data, collected in 2000–2002 among 40–60-year-old employees of the City of Helsinki, Finland, was linked with complete register data on mortality from Statistics Finland (response rate 67%, written informed consent for register linkages 74%). Healthy behaviours included high leisure-time physical activity, non-smoking, no binge drinking and healthy food habits. Each healthy behaviour were dichotomized and assigned a value of one for healthy and zero for unhealthy. The number of healthy behaviours were summed together (score range 0-4). Cox regression models were fitted, and the follow-up continued until the end of 2015 (n = 6336). Confounders included age, sex, marital status, socioeconomic position and self-rated health.

Results:

Of the respondents, 7% reported four healthy behaviours, 27% three, 34% two, 22% one and 9% no healthy behaviours. A total of 281 deaths occurred during the follow-up. Each healthy behaviour was individually associated with a reduced mortality risk, non-smoking having the strongest and healthy diet the weakest association. The combined association showed that those without any of the healthy behaviours (HR 2.8, 95% CI 1.51-5.29) and those with only one healthy behaviour (HR 1.89, 95% CI 1.04-3.43) had a higher mortality risk than those with four healthy behaviours. Instead, those with at least two healthy behaviours were not at an increased risk of mortality.

Conclusions:

A low number of healthy behaviours predicted mortality among middle-aged employees. Efforts should be made to promote multiple healthy behaviours among the middle-aged to enhance health and prevent premature mortality.

Key messages:

- Almost one third of the respondents had no or only one healthy behaviour.
- A low number of healthy behaviours was associated with an increased risk of mortality.

Smoking among immigrants in Norway, results from the Living Condition Survey among immigrants 2016

Marte Kjøllesdal

M Kjøllesdal[1], C Øien-Ødegaard[2], NK Grewal[1], T Indseth[1]
[1]Health Services Research, Norwegian Public Health Institute, Oslo, Norway
[2]Domain of Mental and Physical Health, Norwegian Public Health Institute, Oslo, Norway
Contact: MarteKarolineRaberg.Kjollesdal@fhi.no

Introduction:

Smoking is one of the major risk factors for health and disease. Knowledge on smoking prevalence in groups of immigrants is needed to tailor interventions for smoking cessation.

Methods:

Statistics Norway carried out a Living Condition Survey among immigrants in 2016. Participants were immigrants from twelve countries of origin with ≥ 2 years residency in Norway. They were interviewed in the main language of their country of origin, English or Norwegian as preferred. In this report 4339 immigrants aged 15-66 years were included. Participants were asked "Does it happen that you smoke?" and all participants answering yes to this question were classified as smokers.

Results:

A smaller proportion immigrant women (14%) than other women (21%) smoked, whereas a larger proportion immigrant men (32%) smoked compared to other men (22%). Among immigrant women, the proportion of smokers varied greatly, from almost no smokers from Eritrea and Afghanistan (<1%) to a high proportion among those from Turkey (32%) and Kosovo (29%). Among men, a low proportion of Eritreans (15%) and Sri Lankans (16%) smoked, but >40% of men from Vietnam, Turkey, Poland and Kosovo smoked. Having moved to Norway in young age and long duration of residence increased the odds of smoking among women. Men without a close friend were more likely than other men to smoke.

Conclusions:

Variation in smoking by country of origin and gender should taken into account in future smoking cessation initiatives and prevention among immigrants.

Key messages:

- Smoking prevalence among immigrant vary substantially by country of origin and gender.
- Smoking is related to acculturation and social environment.

Is problematic Internet use associated with substance use among youth? A systematic review

Stéphanie Lanthier-Labonté

S Lanthier-Labonté[1], M Dufour[1,2], DM Milot[1,3], J Loslier[1,3]
[1]Department of Community Health Sciences, University of Sherbrooke, Longueuil, Canada
[2]Department of Psychology, Université du Québec à Montréal, Montreal, Canada
[3]Direction de Santé Publique de la Montérégie, Centre Intégré de Santé et de Services Sociaux de la Montérégie-Centre, Longueuil, Canada
Contact: stephanie.lanthier.labonte@gmail.com

Background:

Problematic Internet use is an important emerging public health problem. Among youth, the link between problematic Internet use and other risky behaviors needs to be define. The National Institute on Drug Abuse was recently questioning if this new problem can explain the downward trend in substance use among young people. The objective of the systematic review is to explore the association between Internet use (with an average time measure and a problematic Internet use measure) and psychoactive substance use (alcohol, cannabis) among youth.

Methods:

Empirical studies meeting inclusion criteria were chosen from important databases and then screened. Quality assessment and narrative synthesis were executed giving the high heterogeneity. Forty-three studies were eligible.

Results:

A majority of studies found a positive association for the association between Internet problematic use and alcohol use, and between Internet problematic use and cannabis use. High heterogeneity in the assessment of alcohol and cannabis use made the synthesis a great challenge. Studies with substance use assessment that were reflecting a higher risk measure more often found a positive association.

Conclusions:

Despite the diversity of the measures used, it seems that Internet use has a potential association with alcohol and cannabis use among youth around the world. When addressing risky behavior such as substance use among youth, professionals should also address problematic Internet use. Further studies are needed to assess the longitudinal impact of Internet use on youth substance use. A golden standard on how to assess alcohol and cannabis use among youth would be welcomed and certainly help future knowledge synthesis.

Key messages:

- Internet problematic use has a potential positive association with alcohol and cannabis use among youth around the world.
- Prevention programs for youth addressing risky behavior should include problematic Internet use, an important emerging public health problem.

Whole systems approaches to obesity and other complex public health challenges: a systematic review

Anne-Marie Bagnall

A Bagnall[1], D Radley[2], R Jones[1], P Gately[2], J Nobles[3], M van Dijk[4], J Blackshaw4, S Montel[4], P Sahota[5]
[1]Centre for Health Promotion Research, Leeds Beckett University, Leeds, UK
[2]Canregie School of Sport, Leeds Beckett University, Leeds, UK
[3]Bristol Medical School, University of Bristol, Bristol, UK
[4]Diet and Obesity, Health Improvement Directorate, Leeds Beckett University, Leeds, UK
[5]School of Clincal & Applied Sciences, Leeds Beckett University, Leeds, UK
Contact: a.bagnall@leedsbeckett.ac.uk

Background:

Increasing awareness of the complexity of public health problems, including obesity, has led to growing interest in whole systems approaches (WSAs). We carried out a systematic review of WSAs targeting obesity and other complex public health and societal issues.

Methods:

Seven electronic databases were searched from 1995 to 2018. Studies were included if there had been an effort to implement a WSA. Study selection was conducted by one reviewer with a random 20% double checked. Data extraction and validity assessment were undertaken by one reviewer and checked by a second reviewer. Narrative synthesis was undertaken.

Results:

65 articles were included; 33 about obesity. Most examined multicomponent community approaches, and there was substantial clinical and methodological heterogeneity. Nevertheless, a range of positive health outcomes were reported, with some evidence of whole systems thinking. Positive effects were seen on health behaviours, body mass

index (BMI), parental and community awareness, community capacity building, nutrition and physical activity environments, underage drinking behaviour and health, safety and wellbeing of community members, self-efficacy, smoking and tobacco-related disease outcomes.

Features of successful approaches reported in process evaluations included: full engagement of relevant partners and community; time to build relationships, trust and capacity; good governance; embedding within a broader policy context; local evaluation; finance.

Conclusions:

Systems approaches to tackle obesity can have some benefit, but evidence of how to operationalise a WSA to address public health problems is still in its infancy. Future research should: (a) develop an agreed definition of a WSA in relation to obesity, (b) look across multiple sectors to ensure consistency of language and definition, (c) include detailed descriptions of the approaches, and (d) include process and economic evaluations.

Key messages:

- Interventions working towards systems approaches are associated with a range of positive health outcomes.
- Evidence of systems science and systems thinking was less clear, even in the most "joined up" approaches.

Electronic cigarette use and smoking reduction – longitudinal data from CONSTANCES cohort study

Ramchandar Gomajee

R Gomajee[1], F El-Khoury[1], M Goldberg[2,3], M Zins[2,3,4], C Lemogne[3,5,6], E Wiernik[2], E Lequy-Flahault[2], L Romanello[2], I Kousignian[7], M Melchior[1]
[1]Social Epidemiology Research Team, Sorbonne University, Pierre Louis Institute of Epidemiology and Public Health, INSERM U1136, Paris, France
[2]Population-based Epidemiological Cohorts, INSERM UMS 011, Villejuif, France
[3]Faculté de Médecine, Université Paris Descartes, Sorbonne Paris Cité, Paris, France
[4]VIMA, Inserm UMR 1168, Villejuif, France
[5]Service de Psychiatrie de l'adulte et du sujet âgé, AP-HP, Hôpitaux Universitaires Paris Ouest, Paris, France
[6]Centre Psychiatrie et Neurosciences, INSERM U894, Paris, France
[7]BSTM - EA 7537, Faculté de Pharmacie de Paris, Université Paris Descartes, Paris, France
Contact: ramchandar.gomajee@inserm.fr

Aims:

Electronic cigarettes are often used by smokers to stop smoking and former smokers to prevent relapse. We examined whether electronic cigarette use lead to smoking reduction and cessation among smokers, and relapse among former smokers.

Design and Settings:

The CONSTANCES cohort, France (2012 - ongoing).

Measurements:

Among smokers (N = 5,400, average follow-up of 23.4 months), mixed regression models were used to examine whether electronic cigarette use was linked to a decrease in the number of cigarettes smoked per day and Poisson regression models with sandwich variance estimators were used to test smoking cessation. In parallel, Cox proportional hazards regression models were used to examine the relationship between electronic cigarettes use and smoking relapse among former smokers who stopped smoking since 2010 (N = 2,025, average follow-up of 22.1 months), year in which electronic cigarettes were introduced in France. All statistical analyses were adjusted for socio-demographic characteristics, duration of follow-up, and smoking characteristics.

Findings:

There was a significantly higher decrease in the number of cigarettes smoked/day among smokers who used electronic cigarettes (decrease of 4.4 cigarettes/day) compared to those who did not (decrease of 2.7 cigarettes/day), as well as a higher relative risk of smoking cessation (adjusted RR: 1.67 [95% CI: 1.51-1.84]). At the same time, among former smokers, EC use was associated with an increase in the rate of smoking relapse (adjusted HR = 1.70 [95% CI: 1.25-2.30]).

Conclusions:

After a follow-up of approximately 2 years, electronic cigarettes use among smokers was associated to a decrease in smoking level and an increase in smoking cessation attempts but among former smokers it was associated to a higher risk of smoking relapse.

Key messages:

- Among smokers, electronic cigarette use was associated to smoking reduction and smoking cessation.
- Among former smokers who quit smoking since 2010, electronic cigarette use was associated to a higher likelihood of relapse.

Combined healthy lifestyle factors and risk of all-cause and cardiovascular first hospitalization

Licia Iacoviello

M Bonaccio[1], A Di Castelnuovo[2], S Costanzo[1], M Persichillo[1], A De Curtis[1], C Cerletti[1], MD Donati[1], G de Gaetano[1], L Iacoviello[1,3]
[1]Epidemiology and Prevention, IRCCS NEUROMED, Pozzilli, Italy
[2]Cardiocentro, Mediterranea, Naples, Italy
[3]Medicine and Surgery, University of Insubria, Varese, Italy
Contact: licia.iacoviello@moli-sani.org

Background:

We aimed to explore the association of combined healthy lifestyles with risk of first hospitalization for all-cause, cardiovascular disease (CVD), ischemic heart disease (IHD) and stroke in a southern Italian population-based cohort. We also investigated several biological mechanisms possibly on the pathway between lifestyles and health outcomes.

Methods:

Longitudinal analysis on 23,161 men and women (aged$\geq$35 y) recruited in the Moli-sani Study (2005-2010). We defined 4 healthy lifestyle factors as abstention from smoking; high adherence to Mediterranean diet; physical activity; absence of abdominal obesity. First hospital admissions for any and CVD-related causes were recorded by direct linkage with hospital discharge form registry. Hazard ratios (HR) with 95% confidence interval (95%CI) were calculated by multivariable Cox-regression.

Results:

Over a median follow up of 7.2 y, we ascertained a total of 9,482 hospitalizations, 3,556 CVD, 939 IHD and 589 stroke-related hospital admissions.

Adherence to all four healthy lifestyles, compared with none or 1, was associated with lower risk of hospitalization for any cause (HR = 0.82; 0.74-0.90), CVD (HR = 0.81;0.69-0.95) and IHD (HR = 0.63; 0.44-0.90) and, to a less extent, with stroke hospitalizations. Inflammatory biomarkers (e.g. C-reactive protein) were likely to partly explain the association between lifestyles and all-cause (14%) or CVD (15%) hospitalizations, while inflammation played a leading role towards risk of IHD (30%) and stroke-related hospital admissions (21%).

Conclusions:

The impact of combined 4 healthy lifestyles on first hospitalization risk was considerable. Inflammatory biomarkers explained a large proportion of this association.

Key messages:

- Improvements to lifestyle reduce the risk of hospitalizations in a general adult population.
- Achieving a greater number of healthy behaviours has the potential to reduce the burden of hospitalizations and the associated healthcare costs.

6.N. Skills building seminar: Innovative future meal services targeting old people in Europe

Organised by: EUPHA (FN)
Chair persons: Enni Mertanen - Finland, Lise Justesen - Denmark
Contact: enni.mertanen@jamk.fi

Aging without appropriate nutrition and provision of food services increases risk of malnutrition, weight loss, sarcopenia and lower functional capacity, quality of life and contribute to higher health care costs. It has been found that appetite, functional capacity and quality of life are closely related. New research and recommendations have been published, projects and rehabilitation programmes have been funded and new service models have been suggested, however there is still a need for adapting and implementing further public health tools in order to prevent costly care, this include a need for developing and implementing innovative ways of providing food services in combination with rehabilitation programmes.

The aim of the workshop is collaborative learning, knowledge building and discussion on future actions that is needed in order to improve public health, quality of life among elderly and prevent rising costs of health, care by focusing on food and nutrition services. This include the opportunity to collect new ideas and experiences from audience cross-different countries. Furthermore, the aim of the workshop is to support future collaboration and project ideas as part of EUPHA Section on Food and Nutrition's work on nutrition for aging people.

The discussion will be based on an introduction of three innovative projects from Scandinavian.

representing different groups of elderly. This include; 1) The young old, retired, home living, in good condition, and active elderly. 2) Community-dwelling frail old people, who need health care and meal services and 3) Residents in nursing homes with a high degree of lost food related functionality.

The workshop is organized by the leaning café -method. This provides an opportunity for all participants to influence the outcome of the workshop. The topics will be:

Young old: How to keep food related functionality in new life situation after retirement? What new food and nutrition services are needed?

Frail old: How to improve food related functionality and prevent frailing? How to use meal services (Meals on Wheels) and nutrition services?

Residents in nursing homes: How to involve residents in meal activities in order to improve or maintain food related functionality in elderly home and quality of life. Which co-operational actions could be implemented.

Key messages:

- New innovative food and nutrition services design to address risk of malnutrition and loss of functionality among a growing aging population.
- Different age-groups of elderly need different food and nutrition services.

An innovative rehabilitating meals-on-wheels service for frail old people

Anette Due

A Due[1], L Justesen[1], A Beck[1]
[1]Department of Nursing and Nutrition, University College Copenhagen, Copenhagen, Denmark
Contact: adue@kp.dk

Background:

Preparing meals are part of ordinary activities of daily living. However, frail old people receiving meals-on-wheels (MOW) may lose their functional abilities in relation to such preparation. No studies have investigated, whether it is possible for frail old people, receiving MOW to learn or relearn to manage own meals. The aim of this intervention is to investigate if a rehabilitating MOW service including an innovative food basket could have a positive effect on functional abilities in relation to the preparation of meals and thereby improve health-related quality of life in frail old people.

Methods:

An 8-week randomized controlled trial. 76 old people (65+ years old) who receive MOW are randomized to either a control group receiving usual MOW service or an intervention group additionally receiving one of four different food baskets consisting of four different food ingredients and recipes with graduation in degree of complexity delivered twice a week. The recipes is chosen in accordance with level of function, assessed by means of AMPS and the old adult practice cooking skills under supervision of an experienced occupational therapist. Primary outcome is health-related quality of life measured by EuroQol-5D-5L, secondary outcomes are physical function (30 seconds chair-stand), Satisfaction with food-related quality of life questionnaire, Food related functional ability questionnaire, Meal quality questionnaire, dietary intake and body weight.

Results:

The intervention is ongoing and planned to end July 2019. Data will undergo statistical analyses and presented in November 2019.

Conclusions:

The study will contribute with new knowledge about whether a rehabilitating MOW service including an innovative food basket could have a positive effect on functional abilities in relation to the preparation of meals and thereby improve health-related quality of life in frail old people.

The Breakfast Club – co-creational meal practices as rehabilitation strategies in nursing homes

Lise Justesen

Background:

A growing aging population demands new welfare public health activities in nursing homes. Involving residents in meal activity through a co-creational approach as part of a rehabilitation strategy has been suggested as a solution, but knowledge is limited. This project explore how co-creational meal practices in a breakfast club might improve residents' food related functionality and quality of life.

Methods:

The project is designed as a three-year complex intervention study in a Danish nursing home. A breakfast club is held with 4-5 residents (16 all together) and 2-6 staff members on a weekly basis during a period of 10 month. Residents are on shift hosting the club and all members are preparing the meal together. The degree of food related functionality is assessed after each club and is analyzed through paired t-test on mean values. Semi-structured interviews in combination with Research Driven Photo-Elicitation is conducted with 16 residents and 8-10 staff members before, during and after holding the clubs in order to evaluate quality of life and potentials for implementing meal practices to everyday practices. A hermeneutic analysis strategy is applied.

Results:

Preliminary results from 12 breakfast clubs finds an increase in residents food related functionality. Data will be presented in November 2019. All residents express impact on quality of life independent of physical or mental state. Improved functionality is not the main value for participation in the breakfast club. Staff became aware of utilizing residents food related functionality.

Conclusions:

The study will contribute with new knowledge about whether co-creational meal activities could have a positive effect on functional abilities and improve health-related quality of life in residents in nursing homes. A meal practice based on co-creation has potential to become implemented as a public health activity in nursing homes and increase residents' quality of life and food related functionality.

More variable food and nutrition services for young old

Enni Mertanen

E Mertanen[1]
[1]School of Business, JAMK University of Applied Sciences, Jyväskylä, Finland
Contact: enni.mertanen@jamk.fi

Aging population means more costs on health services by frailty, illnesses and malnutrition. Good nutrition and suitable food services can prevent life quality loss and costly consequences. The young old, retired and home living, not receiving municipal services yet, could benefit minor nutritional support and new services helping them keep functionality. However, few services are targeting the young old. Providing new food or nutrition services for people still in good condition might prevent costly care later. The aim is to identify new service ideas and designs for the young old. The project started as part of Agefood-project (Valve et al 2018) and continued with students in 2019.

Methods:

The service ideas and designs were produced in three future workshops, in Jyväskylä (n = 38, food service professionals, service developers, nutritionists), Mikkeli (n = 15, food service and home care professionals, elderly) and Lahti (n = 11, elderly and nutritionist) in 2018. In the next phase, service designs were further developed by students. The service ideas and designs are categorized and analyzed qualitatively.

Results:

Together 443 new service ideas were produced, and 56 preliminary service designs. The student group produced 77 service designs. The categories of ideas are: choosing possibilities, developing meal quality, guiding and education, technological possibilities, eating together, support, and old services. The service designs were classified the following groups: home delivered food, service supports eating at home, technological solutions, eating together.

Discussion:

Many ideas and designs need co-operation with public health people and business. The service ideas and designs need further development, but some are very promising, like personal nutrition trainer, e-learning for elderly care personnel. Better and more variable food and nutrition services can help people live at home longer. The ideas and service designs mirror the public discussion on the time.

6.O. Workshop: Greening the European Public Health conferences, and beyond

Organised by: EUPHA, EUPHA (HIA), EUPHA (ENV)
Chair persons: Rainer Fehr - Germany, Peter Van Den Hazel - EUPHA (ENV)
Contact: rainer.fehr@uni-bielefeld.de

Climate change is real; and its health implications are numerous and serious. The UN Sustainable Development Goals (SDG) include responsible consumption (SDG 12) and climate action (SDG 13). Scientific conferences are significant and regularly recurring components of professional life. They represent major opportunities, e.g., of information exchange, networking and quality assurance. At the same time, they involve major amounts of traveling as well as other resource-intensive activities.

For several years now, based on a perspective of sustainability and professional credibility, EUPHA has taken steps of caring about the impact on environment and health, especially of "greening" the EPH conferences. This includes efforts to learn from other associations and institutions. Within EUPHA, a "Green Club" was formed to develop suggestions and to promote the issue.

The intention is to reduce the "ecological footprint", including less resource consumption and fewer emissions. But "greening" our conferences turns out to be no trivial task. In some respects (e.g. air travel), the environmental and health implications are obvious, but to establish benign alternatives is challenging. In other respects (e.g. catering/regional food), the implications of different alternatives can be much harder to identify.

An important element of current debate on climate protection is "climate compensation", i.e. paying for compensation measures in proportion to the approximate production of CO2, e.g. from travel activities. This is offered by various providers), and often can be included during the booking procedure. There is, however, a debate questioning the rationale, pointing at technical and/or ethical difficulties implied in this approach. Given the state of climate change, it is urgent to continue the debate and to intensify practical action.

Key issues for this workshop include the following: What has been achieved so far? What experiences were made, e.g. concerning usability of tools? Can quantification of emissions from our conferences (especially from air travel) contribute to increasing awareness and to moving towards solutions? What tasks lie ahead? What specific suggestions can be given, e.g., for the 2020 World Congress Public Health in Rome?

Clearly, in tune with the SDGs, the same "footprint" metaphor applies - beyond our conferences - to regular work (in offices, labs, fieldwork and duty travel), private travel, recreation, and daily life at large. It is an open question if it is better to integrate such issues into one "integrative" (and complex) approach, or to deal with these issues "one by one", which might take ages to achieve; or what other ways towards "greening" our lives should be taken. For such discussion, it will be useful to continue cooperation with other professional associations and/or institutions, facing similar challenges.

Key messages:

- For reasons of responsibility and credibility, professional associations need to care about their ecological footprint; EUPHA created a "Green Club" and explores practical measures for "greening".
- Both resource consumption and emissions from EPH conferences are considerable, calling for intensified action, e.g. provision of evidence, awareness-building, and promotion of eco-friendly options.

Greening the European Public Health conferences – The Green Club

Julian Mamo

J Mamo[1]
[1]Department of Public Health, University of Malta, Msida, Malta
Contact: julian@julianmamo.com

EUPHA members prepared a discussion paper on EUPHA's "health and environment awareness" in 2015, presented it to the EUPHA section council, and conducted a workshop at the European Public Health (EPH) conference in Vienna 2016. Following this initiative, the Association determined that greening the conferences is one of the objectives for the EPH Conference strategy for 2017-2020. A "Green club" was set up by the Executive director in 2017.

For reducing the environmental impact of the conference, the following were some of the early objectives and actions (2016): Catering - Coffee and tea served in recycled cups; most lunch ingredients from regional and organic origin. Reduced printing - Switching to E-Posters, digital marketing and email communication. Paperless communication - Abstract submission, registration and invoicing became fully web-based; the Conference Programme and abstracts could henceforth be accessed online. The Conference Bag was made of recycled materials.

With the EPH conferences in Stockholm 2017 and Ljubljana 2018, advised by the Green Club, the following initiatives were taken: Lunches and Conference Dinner no longer served beef; vegan and vegetarian menus were introduced. Reduced printing - By 2018, the option to have a hard copy of the list of delegates was no longer offered. The conference Foundation encouraged its suppliers to limit the environmental impact of their products and services. In Stockholm, all restaurants at the venue were licensed to use the Nordic Ecolabel. All delegates and participants were encouraged to travel CO2 neutral.

For Ljubljana in 2018, the Green club consulted the WHO Europe publication ‘‘Planning Healthy and Sustainable Meetings’’ and considered initiatives that participants could do for compensating their environmental impact. For the 2019 conference, discussions are intended to involve a wider conference participation.

Using the WHO EURO checklist for healthy and sustainable meetings

Dineke Zeegers Paget

D Zeegers Paget[1]
[1]EUPHA, Utrecht, Netherlands
Contact: d.zeegers@euphaoffice.org

Following the decision by the EUPHA/EPH Conference Green Club to use the WHO EURO checklist for healthy and sustainable meetings for the EPH Conferences in Ljubljana 2018, the Green Club thought it a good idea to set a baseline on the health-related and sustainability measures for conferences organised in Europe. If we could compare several European conferences on public health related topics with our own EPH Conference, we could formulate objectives for the future, to be included in the next EPH Conference strategy 2020-2025. The ambitious idea of the Green Club was that EPH Conferences should always be above the average of other conferences organised in EUPHA, whilst continuing to strive for being the best in Europe.

The executive director of EUPHA decided to use the WHO EURO checklist for all the meetings and conferences she would attend in 2019. In the planning for 2019 were 20 meetings throughout Europe. It is expected that this would provide a nice baseline.

The WHO EURO checklist includes questions on venue and transport, invitation and conference materials, food, beverages, tobacco-free, physical activity classes and breaks, waste and use of sustainable materials. Special attention was given to people with disabilities.

The interim results (until the end of April) show that a large fraction of the questions can only be answered if you are the conference organiser, not a conference participant. This was true for questions like: ‘Does the venue use energy-efficient practices?’. Some questions address more fundamental issues, e.g.: ‘Is holding a meeting in a virtual format ... an option?’. The issues of travel mode and/or emission offsetting are not included.

Overall, the checklist approach seems useful. Short of supporting benchmarking, it helps collecting qualitative information and model solutions, and may foster networking among associations towards healthy and sustainable meetings.

Towards quantifying CO2 emissions from EPH conference travel

Rainer Fehr

R Fehr[1]*, D Zeegers Paget*[2]*, OCL Mekel*[3]*, N Bos*[4]
[1]Public Health Department, Bielefeld University, Bielefeld, Germany
[2]EUPHA, Utrecht, Netherlands
[3]Health Data and Assessments, Campus Development, NRW Centre for Health (LZG.NRW), Bochum, Germany
[4]University of Wageningen, Wageningen, Netherlands
Contact: rainer.fehr@uni-bielefeld.de

Background:

Aviation is accountable for significant emissions of carbon dioxide (CO2). Factors determining emissions include, e.g., trip distance, aircraft fuel efficiency, cabin class, atmospheric conditions, and stopovers. Approaches to estimate the carbon footprint are available, e.g., as carbon emissions calculators, offered by carbon offset providers.

Goal: To estimate the amount of CO2 emissions associated with EPH conference air travel, for fostering awareness among EPH conference attendees.

Methods:

Based on EPH attendees’ empirical distribution of countries of origin for the 2017 Stockholm and 2018 Ljubljana conference, rough estimates of travel distances, CO2 emissions, and potential carbon offset costs were produced. In the absence of attendees’ detailed travel information, simplifying assumptions had to be made, e.g. on air vs. ground travel, place of departure, and stopovers. In approach A, using two different offset calculators, we look at a given ‘‘sample’’ country which provided a large fraction of foreign participants in both 2017 and 2018, then try to extrapolate to participants at large. In approach B, we use a rough approximation of total distance travelled by all participants, and an average emission value per distance unit.

Results:

In approach A, expectedly, the emission estimates provided by the two different calculators and the associated price tags for offsetting were rather similar, whereas the overall approach B created lower estimates of CO2 emissions. In summary, the conference air travel was estimated to emit 650-930 tons CO2, with the cost for setoff being roughly € 20.000. In a typical case, the conference air travel CO2 emission of a person (foreign to the conference country) was estimated as being 580 kg. For comparison: to bring climate change to a halt, the total annual CO2 emission per person needs to be below 600 kg.

Discussion:

While estimates should be improved, a major task lies in promoting CO2 emission reduction and mitigation.

6.P. Workshop: The Danish MAMAACT trial as an example for discussing evaluation methods in complex interventions

Organised by: University of Copenhagen
Chair persons: Sarah Fredsted Villadsen - Denmark, Helle Johnsen - Denmark
Contact: hjoh@sund.ku.dk

Over recent years, immigration to Europe has risen significantly. This development has led to increasing birth rates by non-Western immigrant women. Maternity care systems are not yet adapted to this increased diversity of women. In

Denmark, 13 % of all children are currently born by women originating from non-Western countries. Despite a publically funded antenatal care, non-Western immigrant women have lower utilization of Danish antenatal care compared to other women giving birth.

Many non-Western immigrant women have an increased prevalence of severe maternal morbidity and higher risks of maternal death, stillbirth and infant death compared to the majority populations. Poor health status at birth can impair the cognitive, sensory and motor development and lead to learning disabilities during school age, and thus reduce equality in life chances. Suboptimal care is a contributing factor to these ethnic disparities. Provision of appropriate antenatal care is pivotal to reduce these serious disparities and challenges to public health, however little is known about models of care, which can overcome these barriers.

The MAMAACT intervention was developed to increase response to symptoms of pregnancy complications among maternity care providers as well as non-Western immigrant women. The intervention consisted of postgraduate training of midwives in intercultural communication and health education materials (leaflet and an app) for non-Western immigrant women describing how to respond to warning signs during pregnancy in six different languages, The intervention was implemented at 10 out of 20 Danish maternity wards as part of a national trial from the year 2018 to 2019, potentially reaching 25.000 pregnant women, including 2500 of non-Western origin. This workshop shares insight into innovative ways of providing antenatal care for non-Western immigrant women and will focus on methodological aspects of scientific evaluation of complex interventions for vulnerable populations. The workshop includes an introduction, three presentations, and a discussion with the audience.

Using quantitative data, the first presentation will give an overview of ethnic disparities in stillbirth and infant death in Denmark. The second presentation will present qualitative data from the implementation evaluation of the MAMAACT intervention with a focus on the interventions program theory, methodological considerations and evaluation results. Finally, the third presentation will illuminate how the concepts of Health Literacy and cultural health capital contribute to an understanding of mechanisms leading to ethnic disparities and how they can be used for evaluating the impact of the MAMAACT intervention. The final discussion will stimulate knowledge sharing between the participants on how to combine quantitative and qualitative insights in trials, how to build partnerships and recruit vulnerable populations in evaluations, and how to use sociological theory in evaluations.

Key messages:

- Reducing ethnic disparity in reproductive health requires maternity care systems to rethink their antenatal care services so they are better equipped to support non-Western immigrant women's needs.
- Sharing knowledge on the use of mixed methods, recruitment of vulnerable populations, and the use of sociological theory can contribute to future approaches to evaluate complex interventions.

Differences in stillbirth and infant mortality by maternal country of birth and descent in Denmark

Trine Damsted Rasmussen

T Damsted Rasmussen[1], SF Villadsen[2], S Smith Jervelund[3], AM Nybo Andersen[1]
[1]Section of Epidemiology, University of Copenhagen, Copenhagen, Denmark
[2]Section of Social Medicine, University of Copenhagen, Copenhagen, Denmark
[3]Section of Health Services Research, University of Copenhagen, Copenhagen, Denmark
Contact: trdr@sund.ku.dk

International studies have reported inequalities in stillbirth and infant death among ethnic minority groups compared to the host population. The same tendencies have been reported in Denmark. We investigated differences in the risk of stillbirth and infant death among offspring of immigrants and descendants in Denmark, compared to the risk among women of Danish origin.

The population-based register study included all live births and stillbirths with gestational age $\geq$ 22 weeks delivered by women of Danish origin, immigrant women and descendants in Denmark in the period 2005-2016. The study population was restricted to deliveries by women of Danish origin and country groups of immigrants and descendants with more than 2000 deliveries during the study period (n = 792 705).

Logistic regression analysis adjusted for year of birth was used to estimate odds ratios (OR) with 95 % confidence intervals (CI) of the association between maternal country of birth and country of descent and respectively stillbirth and infant mortality.

Immigrant mothers from Turkey, Iraq, Somalia, Pakistan, Afghanistan, Syria and Iran had a statistically significant elevated OR of stillbirth compared to women of Danish origin; adjusted OR̀s ranging 1.45-2.93. Danish-born women with respectively Turkish (OR 1.44, 95 % CI 1.00-2.07) and Pakistani descent (OR 2.32, 95 % CI 1.50-3.60) had an increased risk of stillbirth similar to the one among immigrant women with the same origin. For infant death, we found increased OŔs among immigrant women from Turkey (OR 1.76, 95 % CI 1.28-2.40), Somalia (OR 1.84, 95 % CI 1.31-2.58), Lebanon (OR 1.63, 95 % CI 1.03-2.60) and Pakistan (OR 2.85, 95 % CI 2.05-3.96). Only women of Pakistani descent (2.22, 95 % CI 1.28-3.86) had a statistically significant increased risk of infant death.

These findings show substantial differences in stillbirth and infant death according to maternal country of birth and descent in Denmark during the first decades of the 21st century.

What can we learn from the national implementation of The MAMAACT intervention?

Helle Johnsen

H Johnsen[1,2], U Christensen[1], M Juhl[2], SF Villadsen[1]
[1]Section of Social Medicine, University of Copenhagen, Copenhagen, Denmark
[2]Midwifery Programme, University College Copenhagen, Copenhagen, Denmark
Contact: hjoh@sund.ku.dk

Initiatives to improve maternal and child health among non-Western immigrant populations in Western countries are still sparse. So far, interventions within antenatal care have primarily focused on doula support and group-based antenatal care.

A qualitative evaluation of the implementation of the intervention was undertaken to explore midwives and non-Western immigrant women's attitudes towards and experiences of using the MAMAACT intervention. The evaluation also investigated key contextual factors impacting the interventions utilization. Data consisted of focus group interviews with midwives (n = 9) and in-depth interviews with non-Western immigrant women (n = 15), as well as observations of midwifery visits (n = 42). Data were collected at five intervention sites across Denmark and it was analyzed using systematic text condensation.

Findings show that midwives found the MAMAACT intervention to be a relevant tool, which was easy to implement in antenatal care. Several organizational factors such as task load, interpreter services and lack of cooperation with general practitioners impacted the implementation of the intervention. Non-Western immigrant women found the leaflet and app to be useful tools in distinguishing between normal and abnormal pregnancy symptoms. The degree to which the intervention was used by the women varied between the participants, and women also used other sources of information during their pregnancy. Contextual factors such as lack of social network and material resources as well as language proficiency impacted how women responded to their pregnancy symptoms. Findings show that in addition to targeting the intervention to midwives and non-Western immigrant women's informational needs, structural factors such as the organization of antenatal care and women's socioeconomic conditions need to be addressed in order to reduce ethnic disparity in reproductive health.

Ethnic disparity in health literacy related to interaction with the health care provider

Sarah Fredsted Villadsen

SF Villadsen[1]
[1]Section of Social Medicine, University of Copenhagen, Copenhagen, Denmark
Contact: sfv@sund.ku.dk

With the current orientation towards patient-centered care, the health literacy level is an important predictor for the engagement in preventive health care services. Research has shown that adult immigrants have lower levels of health literacy compared to the host populations, however little is known about the health literacy of pregnant, immigrant women. The aim of this study was to analyze whether ethnic minority women found it more difficult to actively engage with their health professionals than ethnic Danish women did.

Using cross-sectional data we studied the difference in the Health Literacy Questionnaire (HLQ) domain on actively engagement with health care providers between non-Western born and ethnic Danish women (n = 406). Pregnant women were recruited in 2016 from the largest maternity ward in Denmark. The mean health literacy level of actively engagement for ethnic Danish women was 4.15 and for non-Western born women, it was 3.97. In an adjusted model the non-Western born women had 1.15 (CI:-0.30; -0.01) lower levels of actively engagement compared to ethnic Danish women.

These results indicate that this domain of the HLQ seems to be a useful link in understanding ethnic inequality in birth outcomes and thus relevant in the effect evaluation of the MAMAACT study. Currently, the health care system in Denmark has not focused on intercultural competence. The lower levels of self-reported ability to engage with health care providers and the known perspectives of lower patient safety in immigrant groups calls for more research in the interactional dynamics. A theoretical analysis using the concept of cultural health capital could be interesting for assessing how health care providers and non-Western women might value certain attitudes and behaviors exchanged during the encounter differently, which could lead to imbalance as the health care provider has more influence in this setting.

6.Q. Workshop: Health Literacy in the workplace: from health literate organizations to resilient individuals

Organised by: EUPHA (HP)
Chair persons: Luís Saboga-Nunes - EUPHA (HP), Carine Simar - France
Contact: saboga.nunes@gmail.com

This workshop aim is to explore the call that is proposed by the WHO declarations of Nairobi and Shangai, that institutions should move forward to become health literate organizations. This workshop addresses qualitative and quantitative health literacy research work settings of health and non-health professionals. Health literacy has evolved into a significant public health and health promotion goal which is especially influenced by the social and cultural background, the availability of resources, and the settings in which it is practised. Basically, health literacy can be defined as the knowledge and skills to access, understand, appraise and apply health information in order to promote health and well-being. For a long period most research had focused on adult patients in clinical settings, but in the recent past there have been significant efforts from research, practice, and policy towards citizens in other organizational settings, which is due to findings stating that effective health literacy promotion begins and continues across all settings in a whole society approach since health is mostly shaped outside the health care setting. Such approaches can also be influential when addressing the reduction of health inequalities.

The main objective of this workshop is to present first time empirical findings and developments from ongoing research projects of the Health Literacy in workplace (ProLiSa). Thereby, it will shed light on the health literacy of professionals, and link the current debate with contemporary public health approaches to advance the field of health literacy. The workshop will include 5 presentations with up to 15 minutes input followed by discussions. The first presentation is a tentative to understand health literacy and ehealth tools to improve quality of life. From Brazil a second presentation will consider health care organizations (hospitals) and the perspective to move to health literate organizations. From Portugal a third presentation will consider migration and integration and the case of health literacy as a foundation to promote cultural sensitiveness in the organizational setting. A forth presentation will consider how communicating with migrants can be a challenge and how children's health literacy, digital technology can become and critical help. Finally the last presentation considers the role of health literacy and physical activity as buffers to counter act work related stress.

This workshop offers a forum for researchers, practitioners and policy-makers interested in health literacy. By dialogue and two-way communication lively interaction and vivid discussions will be facilitated. This will allow discussing results with regard to their benefit for improving health literacy research, practice, and policy-making, support further synergies, break down barriers between research infrastructures, facilitate networking and collaboration, and support international capacity building.

Key messages:

- There is need for empirical health literacy research in work settings. It will allow informing sustainable and effective interventions and the development and application of better tools.
- Addressing the social environment will have impact on public health research & practice, will facilitate the development of health literate organizations, new concepts/strategies for health promotion.

Health literacy and ehealth tools to improve quality of life

Luís Saboga-Nunes

L Saboga-Nunes[1,2], *A Pereira*[1,3], *A Picado*[1,4], *E Moraes Filho*[1]
[1]Public Health Research Centre, National School of Public Health, Universidade NOVA de Lisboa, Lisbon, Portugal
[2]Institute of Sociology, University of Education, Freiburg, Germany
[3]Institute of Implantology Prof Dr. João Caramês, Lisbon, Portugal
[4]UCI Neurocriticos/Departamento Neurociencias, Centro Hospitalar Universitário Lisboa Norte, Lisbon, Portugal
Contact: saboga.nunes@gmail.com

Introdution:

The use of smartphones and apps to achieve numerous goals, has reached a vast number of citizens today in the world. Health related apps (HAPPS) (estimated to be 318.500 in 2017) have become popular, but little is known about their real impact in public health. The goal of this research is to understand what are the most common used HAPPS, how health literacy (HL) mediates their use and to what extent do they contribute to quality of life.

Metods:

The study is observational, cross-sectional and includes both quantitative and qualitative data from an adult population working in the financial corporation. By the means of a survey (CAWI) data was collected about HL (using the European Health Literacy Survey validated to Portugal ((HLS-EU-PT), the use of apps and their influence on quality of life. The sample (n = 748) includes participants from the different offices of the company in Portugal main land and its autonomous territories.

Results:

In this study (58.7% males) 40% of the individuals have between 36 and 45 years old, and 9.2% refer the use of health promotion apps. Of the participants, 7.1% have inadequate, 39.0% problematic, 36.6% sufficient and 17.3% excellent HL (HLS-EU-PT). Content analysis showed the categories most common in this sample were apps for running 44.9% (58.1% males) and health monitoring 26.1% (with 55.6% males). Those who use apps have a slightly higher value of HL than those who don't use, but this difference is not statistically significant.

Conclusions:

In this sample not more than 10% of individuals are using apps to promote their wellbeing. Implementing research focusing HL, quality of life and the use of mhealth tools is a new field in public health and allow researchers to identify trends that may trigger strategies to implement health promoting strategies in the work setting. More research is needed to understand how mhealth shape the everyday lives of prosumers in their quest for wellbeing.

From health care hospitals to health literate organizations: the case of health literacy of health workers in Brazil

Rosane Martins

R Martins[3], L Saboga-Nunes[1,2], M Regina Farinelli[3], M Gabriela Carascosa[3], P Ribeiro[3]
[1]ProLiSa, Public Health Research Centre, National School of Public Health, Universidade NOVA de Lisboa, Lisbon, Portugal
[2]Institute of Sociology, University of Education, Freiburg, Germany
[3]Universidade Federal Do Triângulo Mineiro, Uberaba, Brazil
Contact: saboga.nunes@gmail.com

Background:

Health literacy (HL) presents itself as a strategy to rethink lifestyles and enhance health promotion strategies (with the inclusion of social determinants of health) in the workplace. The aim of this research was to evaluate HL levels of health workers from the urgency and emergency sector of a public hospital in Brazil (Uberaba, Minas Gerais, HC/UFTM-SUS).

Methods:

An exploratory, quantitative and qualitative research based in the European Health Literacy survey (validated to Brasil HLS-EU-BR) collected data from 216 participants, by the means of a CAWI methodology.

Results:

A total of 141 participants were retained for data analysis. HL level of participants from the administrative sector reached a score of 40.0% for insufficient and problematic HL; 33.3% had sufficient HL levels and 26.7% showed excellent HL levels. For the category of Healthcare medium / technical level, 48.2% had inadequate and problematic HL; 37.5% had sufficient and 14.3% showed excellent HL levels. In the third category - Healthcare participants with higher education levels - 31.6% had problematic, 34.2% sufficient and 34.2% showed excellent HL levels.

Conclusions:

This is the first time the instrument (HLS-EU-BR) to evaluate HL is used in a health professional setting in Brazil. This research demonstrated that HL is sensitive to socioeconomic differences and highlights the need to promote HL of health workers. Targeting lower socioeconomic groups that have a routine of dealing with the general public in a public hospital to increment HL levels, seems to be an option worth investigating. Such a proposition could not only benefit the specific worker, but target a social change in quality of care, health promotion and social support that can be centered in hospitals. This would trigger the needed change proposed by WHO in Nairobi and Shangai: shifting health care organizations to health literate organizations.

Migration and integration: the case of health literacy (HLS-EU-PT) as a foundation to promote cultural sensitiveness

Alcinda Reis

L Saboga-Nunes[2,3], A Silva[2], S Mendes[2], B Almeida[2], M R André[4], A Reis[1]
[1]Santarém Health School, IPsantarém, Santarém, Portugal
[2]Public Health Research Centre, National School of Public Health, Universidade NOVA de Lisboa, Lisbon, Portugal
[3]Institute of Sociology, University of Education, Freiburg, Germany
[4]SCML/PAR - Santa Casa da Misericordia de Lisboa, Plataforma de Apoio aos Refugiados, Lisbon, Portugal
Contact: alcinda.reis22@gmail.com

Background:

Portugal has experienced trough-out his recent history successive migration patterns. Lately, with instability in Syria and the Mediterranean routes of migration between Africa and Europe, new challenges have emerged. One of them is related to migrants' health and their navigation of health care system. In order to better understand cultural patterns of migrants, this research aims to explore their health literacy (HL) in the context of the European Health Literacy Survey framework (HLS-EU).

Methods:

A total of 748 participants from the different offices of a company in the financial sector (Portugal, main land and autonomous territories) participated in a cross sectional survey (CAWI). Age ranged from 25 to 65 years and HL was measured using the HLS-EU instrument validated to Portuguese (HLS-EU-PT). Each participant was allocated to one of the groups, either of satisfactory HL (when scores $\geq$30) or insufficient HL (when scores <30). In order to access the migrant condition, a proxy variable considered the participant's parents origin: at least one of the parents was born in a foreign country.

Results:

Out of the 748 participants, 4.1% (n = 31) were considered migrants. Of the migrant participants, 6.9% have inadequate, 51.7% problematic, 24.1% sufficient and 17.2% excellent HL (HLS-EU-PT). Migrants have lower levels of HL when compared with nationals in this sample (respectively 58.6% and 45.8% for insufficient HL) but this difference is not statistically significant.

Conclusions:

Although results didn't show an association between being migrant and lower levels of HL (when compared with nationals), it is nevertheless relevant to consider that more than 1 in every two migrants (58.6%) have insufficient HL levels. Special consideration should be given to this group to promote HL levels and further research is needed to better understand how HL and cultural sensitiveness may work for a better integration of migrants.

Communicating with migrants: children's health literacy, digital technology, health promotion tools

Contact: alcinda.reis22@gmail.com

Background:

Being a migrant can enact road blocks in the process of integration, if language barriers persist in the communication between health professionals and migrants. Moreover, health literacy levels (HL) can differ, based on different cultural contexts or conceptions of health and illness. This research aims at exploring migrants (digital) HL and the mediating role of migrant's children in primary health care setting. Health professionals' resort to migrants' children as interpreters and mediators has been highlighted with the younger generations' digital literacy, as critical tools to overcome such barriers. Assessing and promoting migrant's HL is a public health mandate in the promotion of individual and family health to establish a common ground base for communication.

Methods:

A qualitative and ethnographic study based on narratives, participant observation, focus group and ethno biographic interviews with nurses, migrants, medical doctors and intercultural mediators, involved 52 participants in a primary health care setting in Santarém district, Portugal. Partnership with the Observatory for Migration, the High Commission for Migration (ACM) and with migrant associations, enabled the completion by migrants of an online questionnaire focusing on digital HL.

Results:

Migrants' children were identified as facilitators in the clinical setting at three levels: the communication, HL promotion and adherence to continuity of care.

Conclusions:

Improve migrant's HL and health decisions is feasible when considering several strategies to overcome cultural barriers. Migrants' children are potential mediators in the process of communication between health professionals and adults. Awareness of their potential allows adjustments in the primary health care sector. The need to further investigate migrants' HL and digital HL (e.g. telephone translation services, Internet-based tools for scheduling health appointments) are some tasks that need further research.

Health literacy and physical activity as buffers to counter act work related stress

Luís Saboga-Nunes

L Saboga-Nunes[1,2], *P Madaleno*[1], *T Ferreira*[1], *R Guerra*[1], *I Mata*[1], *B Barros*[1]

[1]Public Health Research Centre, National School of Public Health, Universidade NOVA de Lisboa, Lisbon, Portugal

[2]Institute of Sociology, University of Education, Freiburg, Germany

Contact: saboga.nunes@gmail.com

Background:

Stress health problems affect 47.8% of the work force in Portugal. It is predicted that, in the next decade, these problems will overcome musculoskeletal disorders, the first cause of employee's withdrawal from work. Research indicates connections between stress and dimensions of the work place (like job satisfaction). Nevertheless the conceptual understanding of these relationships is sparse. In order to better understand these relationships, this research focus on the use of job–specific models of stress, associating them with health literacy (HL) - in the context of the European Health Literacy Survey framework (HLS-EU) - and physical exercise.

Methods:

A total of 748 participants from the different offices of a company in the financial sector (Portugal, main land and autonomous territories) participated in a cross sectional survey (CAWI). Age ranged from 25 to 65 years and HL was measured using the HLS-EU instrument validated to Portuguese (HLS-EU-PT). Each participant was allocated to one of the groups, either of satisfactory HL (when scores ≥ 30) or insufficient HL (when scores <30).

Results:

Out of the 748 participants (58.7% males, average age of 39 years), 80.4% sometimes and very often experience stress and tension in the workplace. Less than one in every two (44.4%) practice physical activity several times a week. Of the participants, 7.1% have inadequate, 39.0% problematic, 36.6% sufficient and 17.3% excellent HL (HLS-EU-PT). Employees that are more active are those who experience lower levels of stress.

Conclusions:

The research of the effects of HL combined with physical exercise, as buffer variables to problems related to the effects of work stress, is a new area of research that may help understand patterns of adherence to activities that can help workers deal with everyday working conditions. More research is needed to integrate HL strategies in the work place.

7.A. Workshop: Capacity building in public health in Northern Africa. A common effort to develop training programmes

Organised by: Babes-Bolyai University

Chair persons: Razvan M Chereches - Romania, Arja Aro - Denmark

Contact: elena.bozdog@publichealth.ro

Background:

In the years that have followed the overthrow of the former autocratic regime and the democratization of the country, the CONFIDE partner country, Tunisia, has experienced positive political and economic changes. These changes have driven important reforms in the field of public health, yet this country is facing important challenges in building a modern health system and finding an integrate approach to the main national public health problems. In terms of health research system, in Tunisia there is little coordination between stakeholders and the institutions in charge of public health. Moreover, there is no specific mechanism for informing the Ministry of Health about the progress of research in Tunisia and overall there is no structure responsible for the dissemination of research results to the public. To this end, the European and Tunisian members of this consortium have designed together the present capacity building project which aims to inform public health policies in Tunisia based on evidence and contribute to the development of public health research. The CONFIDE project is contributing to the development of the public health field in Tunisia and provides knowhow and tools to the Tunisian public health professions to better collaborate with the local stakeholders.

Aim of the workshop:

The aim of this workshop is to share the experience of the capacity building process in the public health field in Northern Africa. The workshop will discuss and analyse the structure of opportunities for change and reform and the local needs of the public health domain in Tunisia and will identify the main challenges. We will present the processes used and challenges faced, but also the ways to overcome these challenges.

This workshop will contribute to the European Public Health field by increasing the visibility at European level of the efforts directed to capacity building interventions and at transferring knowhow outside Europe, specifically Northern Africa.

Program:

The introduction to the workshop will be made by Prof. Razvan Chereches MD, PhD, Professor of Public Health and coordinator of the CONFIDE project. He will describe the methodology used for the capacity building in public health trainings programme in Tunisia. The development of the Centre for Evidence Based Public Health in Tunisia and their impact on the Tunisian local and regional levels will be presented by Prof. Fatma Cheikhrouhou. The link between the knowledge transferred to the young professionals and the policy decision makers will be described by the Tunisian coordinator of the dissemination activities, Prof. Kalthoum Kallel. MScPH Maria Palianopoulou will follow with presenting the evaluation results of the capacity building process and lessons learnt. Last but not least, the sustainability of the trainings and the local effort to integrate the knowledge into the Medical University curricula will be presented by Assistant Prof. Mohamed ben Rejeb.

Key messages:

- Discussing lessons learnt can contribute to better tools for the development of public health.
- Partners̀ perspective and culturally adapted tools are important for high quality learning process.

Strengthening public health research capacity to inform evidence-based policies in Tunisia / CONFIDE

Elena Maria Bozdog

ME Bozdog[1], MA Coman[1], O Oltean[1], RM Chereches[1]
[1]Department of Public Health, Babes-Bolyai University, Cluj-Napoca, Romania
Contact: elena.bozdog@publichealth.ro

Introduction:

Over the past 15 years, Tunisia has experienced considerable development in the political and economic areas. In this context, important reforms in the field of public health have been made, with the Tunisian universities (University of Sfax, University of Tunis el Manar, University of Sousse) on their way to educate the public health professionals who can contribute to the modernization of the health system. Funded by the EC through Erasmus+ programme, the CONFIDE project (coordinated by Babes-Bolyai University, having European partners the Southern Denmark University and Trnava University) has 3 major objectives: develop Centres for Evidence into Health Policy (C4EHPs) designed to ease future collaborations; strengthen institutional capacity to deliver state-of-the-art research into policy training program; consolidate national and local partnerships between the public health academic and non-academic sector.

The progress:

The partners have jointly contributed to the following activities: development of the Centre for Evidence into Public Health Policy, 3 train-the-trainer sessions, 9 train-the-trainees sessions, internships for trainees, one policy game. To this date, 18 trainers have been trained by European partner universities and they trained 29 Tunisian trainees in the field of public health research, health promotion and evidence-based public health policy. The trainees will participate in internships in local and regional health institutions, to practice what they have learned. A policy game will be organized, to simulate collaboration between researchers and policy makers, for public health policy elaboration.

Conclusions:

The Research into Policy training program has been implemented in all 3 Tunisian partner universities. The expected long-term changes are: young workforce trained into public health and evidence-based policies fields; university curricula modifications by introducing public health courses and developing of Masters of Public Health.

Centres for Evidence-base Public Health in Tunisia-development, tasks and opportunities

Cheikhrouhou Fatma

C Fatma[1], A Mokni[1], A Ayadi[1], F Ghorbel[1], N Bouthelja[1], A Mseddi[1], E Elleuch[1], J Trabelsi[1], A Mustapha[1]
[1]Faculty of Medicine, Sfax University, Sfax, Tunisia
Contact: fatima_cheikhrouhou@yahoo.fr

Introduction:

As a part of the CONFIDE project, 3 Centres for Evidence into Health Policy (C4EHPs) were established in the Universities of Sfax (Head Office), of Tunis El Manar and of Sousse in Tunisia. The tasks of the C4EHPs include development of training programs, establishment of a national network of public institutions and NGOs, which will offer internship placements for the centres' trainees as well as enhance public health development in Tunisia in general.

The progress:

The 3 Centres were established, each with the necessary infrastructures of specially designated rooms equipped with computers, books, etc. A communication platform was launched and is regularly updated. Partnership agreements with NGOs and private institutions have been signed. The C4EHPs have supported three Train-the-Trainer modules for 18 Tunisian trainers ran by the 3 European CONFIDE partners, autumn 2018. The centres have each further trained 29 Trainees under the supervision of the European partners, spring 2019.

Conclusions:

The 3 C4EHPs will act as an open source for all trainees interested in enhancing their practical work experience, networking between academic and non-academic environment and facilitating the implementation of the trainee internships. They will also market the CONFIDE products in Tunisia with the aim to sustain the public health development also after CONFIDE. In addition, the centres will search for further international funding for both training and collaborative research, according to the research domain of each faculty. The C4EHP of Sfax will be specialized in the areas of addiction, obesity, emerging infectious diseases and the quality of public health management in rural areas. The challenges of this work include lack of infrastructure and economic resources in Tunisia, lack of multi-level and cross-sectorial collaboration in public health as well as lack of stakeholder collaboration with NGOs and other non-governmental actors in public health.

Dissemination of the capacity building results - tools adapted to the local context

Kalthoum Kallel

K Kallel[1], L Zakraoui[1], Y Ben Othman[1], M Jouini[1], F Selaouati[1]
[1]Faculty of Medicine, Tunis El Manar University, Tunis, Tunisia
Contact: kallelkalthoum@gmail.com

Introduction:

The Centres for Evidence into Health Policy created by the CONFIDE project are multidisciplinary; they are dedicated not only to health professionals but also to researchers, policy makers as well as other social, environmental and economic stakeholders. Good dissemination and awareness among all stakeholders are the basis of the success and sustainability of the project results.

The progress:

Since the start of the project in October 2017 and after developing a dissemination plan, the first and large-scale dissemination action was the creation of a communication platform and a website. Subsequently, we have setup Facebook, Twitter and LinkedIn pages targeting people more involved in the project. These pages are regularly updated (progress of the project, actions carried out). Two press conferences have taken place in order to reach all targeted audiences in Tunisia. Indeed, our press conferences attracted journalists as well as representatives of NGOs, and health decision-makers in the ministry. A poster and a portfolio were designed in order to introduce the project to partner organizations that provide the students̀ internships and field trainings. The project also includes a policy game as a tool to bring to the same table the policymakers, researchers and other stakeholders in the community that will further contribute to the dissemination of the CONFIDE project results. Due to the dissemination activities of the Tunisian partners, the academic community in Tunisia has been exposed to a different approach and understanding of public health. The dissemination activities of the CONFIDE results have shed a new light on public health in Tunisia.

Conclusions:

A good diffusion of the project, using tools adapted to the various audiences, will make it possible to reach a large and multidisciplinary target public and to associate them with the project. This is a key success factor for the sustainability of the Centres for Evidence into Health Policy.

How does capacity building in public health work? Insights from the midterm evaluation of the CONFIDE project

Maria Palianopoulou

M Palianopoulou[1], *L Eklund Karlsson*[1], *AR Aro*[1]
[1]Unit for Health Promotion Research, University of Southern Denmark, Esbjerg, Denmark
Contact: mpalianopoulou@health.sdu.dk

Introduction:

In an increasingly complex, rapidly changing world with a growing inequality gap, capacity building (CB) could function as an essential instrument for improving population health in a resilient and sustainable way. The PH community has been engaged in CB for decades, but there is little empirical evidence about the effectiveness of the efforts. Most evaluations focus on the individual level disregarding the complex, dynamic and multidimensional nature of CB. The aim is to provide an overview of CONFIDE's 4-level evaluation framework - individual, organizational, network and system - and to share the findings and learning from the first 18 project months.

The progress:

A participatory, multilevel evaluation approach is used in CONFIDE. Existing evaluation models/tools, adapted to the project needs, are used to evaluate the interventions; Kirkpatrick's 4-level model guides the assessment of the training program's effectiveness and impact, social network analysis for the networking interventions and organizational capacity and sustainability tools to evaluate the performance of the C4EHPs. Data collection has been conducted via surveys and document reviews at multiple time points.

The preliminary findings show that, on the individual level, the trainees perceived increased knowledge and skills in the three PH fields. On the organizational level, human resources to deliver PH-related training in the participating Tunisian universities have been developed. On the network level, challenges have been encountered in building partnerships beyond the medical field. On the system level, significant delays have occurred in the establishment of the C4EHPs mainly due to the centralized administrative processes in Tunisia.

Conclusions:

While the project's CB process is still at an early phase, the current findings indicate that the diversity of the activities used has contributed positively to the enhancement of the beneficiaries' existing capacities in PH.

Capacity building process – medical curricula implications on the long term

Mohamed Ben Rejeb

M Ben Rejeb[1], *H Said-Latiri*[1], *Ch Zedini*[1], *Th Nabli-Ajmi*[1], *L Dhidah*[1], *A Mtiraoui*[1]
[1]Faculty of Medicine, University of Sousse, Sousse, Tunisia
Contact: mohamed_benrejeb@yahoo.fr

Introduction:

Currently, the Tunisian medical schools are going through a transition period marked by the reform of medical studies. Their curricula must be adapted to globally recognized medical education guidelines. Aware of the importance of teaching scientific research and public health, they are making efforts to integrate this new approach of education within several levels (undergraduate, postgraduate and continuous professional development). In this perspective, the public health research centres (C4EHPs) created under the CONFIDE project provide an opportunity to support such integration.

The progress:

The Faculty of Medicine of Sousse was founded in the 70s to open up to its local and regional community. So, the public health topic was one of the top priorities. With the reform started in 2011, the importance of this topic has been further developed by integrating many modules that cover different aspects of public health throughout the curriculum. In this context, the materials, modules and information developed within the CONFIDE project complement the existing modules and bring a fresh perspective on the teaching methods. The faculty of Medicine of Sousse will integrate this information in the curricula to promote scientific production by allowing students to build up their scientific research knowledge, develop higher research competencies such as critical-thinking, problem-solving and data interpretation and analysis and train public health specialists to be health policy makers in the future.

Conclusions:

Integrating the new approach based on the achievements of the C4EHP is an essential step for our faculty to develop more training in public health, ensure good quality of its teaching process and participate in the development of health policies that will improve the health of the Tunisian population.

7.B. Workshop: Screening infectious diseases amongst migrants in Europe: The diversity of policies

Organised by: French National Institute of Health and Medical Research
Chair persons: Martin Duracinsky - France, Manish Pareek - UK
Contact: duracinsky.m@gmail.com

In Europe, the prevalence of several infectious diseases such as HIV, hepatitis B, hepatitis C and tuberculosis is higher amongst migrants. Late diagnosis of HIV, hepatitis B and C is a health issue that thwarts prevention efforts. Early diagnosis has obvious benefits, both for the individuals (i.e. earlier access to care with a better life expectancy) and for the community. As regard for HIV, treated patients with an undetectable viral load do not transmit the virus. This is in line with the UNAIDS 90-90-90 target that in every country 90% of people living with HIV should be aware of their positive status, 90% of them should be treated with antiretroviral and within 90% should have an undetectable viral load.

Widespread testing of HIV, HBV and HCV is recommended by European guidelines, such those from European Centre for disease Prevention and Control (ECDC). The ECDC recommends that screening for HIV, hepatitis B, hepatitis C and tuberculosis should be offered to every migrant from countries with a high prevalence ($\geq$1% for HIV and $\geq$2% for hepatitis B and C). Other recommendations include ensuring that screening and vaccination is voluntary and confidential, that migrants have a quick access to care, addressing barriers to screening, and taking into account the particular issues and needs of migrants. However, European countries have developed diverse guidelines and initiatives to address the issue of screening infectious diseases amongst migrants.

The objective of this workshop is to present several European initiatives to improve the screening of infectious diseases amongst migrants. Four initiatives will be presented and discussed: screening of active tuberculosis amongst asylum seekers with the use of a questionnaire in Switzerland; replacing the systematic chest X-ray with a screening questionnaire for active tuberculosis and introducing rapid tests for HIV, HBV and HCV for all legal migrants at entry point in France, adding HIV, HBV and HCV testing to the compulsory targeted tuberculosis test in the Netherlands and offering targeted tests for latent tuberculosis, HBV and HCV to migrants registering for primary care in the UK.

Key messages:

- Screening of infectious diseases should be targeted to migrants from high-incidence countries.
- European practices should be harmonized.

Community-based testing of migrants for infectious diseases in the UK (COMBAT-ID)

Manish Pareek

M Pareek

[1]Department of Infection and HIV Medicine, University Hospitals, Leicester, UK

Contact: manish.pareek@leicester.ac.uk

Background:

Migration is a major global driver of population change. Certain migrants may be at increased risk of infectious diseases, including tuberculosis (TB), HIV, hepatitis B and hepatitis C, and have poorer outcomes. Early diagnosis and management of these infections can reduce morbidity, mortality and onward transmission and is supported by national guidelines. To date, screening initiatives have been sporadic and focused on individual diseases; systematic routine testing of migrant groups for multiple infections is rarely undertaken and its impact is unknown. We describe the protocol for the evaluation of acceptability, effectiveness and cost-effectiveness of an integrated approach to screening migrants for a range of infectious diseases in primary care.

Methods and analysis:

We will conduct a mixed methods study which includes an observational cohort with interrupted time-series analysis before and after the introduction of routine screening of migrants for infectious diseases (latent TB, HIV, hepatitis B and hepatitis C) when first registering with primary care within Leicester, UK. We will assess trends in the monthly number and rate of testing and diagnosis for latent TB, HIV, hepatitis B and hepatitis C to determine the effect of the policy change using segmented regression analyses at monthly time points.

Concurrently, we will undertake an integrated qualitative sub-study to understand the views of migrants and healthcare professionals to the new testing policy in primary care. Finally, we will evaluate the cost effectiveness of combined infection testing for migrants in primary care.

Ethics and dissemination:

The study has received HRA and NHS approvals for both the interrupted time-series analysis (16/SC/0127) and the qualitative sub-study (16/ EM/0159). For the interrupted time-series analysis we will only use fully anonymised data. For the qualitative sub-study, we will gain written, informed, consent.

A new strategy for screening infectious diseases amongst migrants: the STRADA study

Martin Duracinsky

F Thonon[1], O Rousset Torrente[1], F Lert[1], D Zucman, S Dimi, O Chassany

[1]PRO unit, INSERM UMR1123, Paris, France

Contact: duracinsky.m@gmail.com

Background:

In France, the prevalence of HIV, HBV and HCV is high amongst migrants and widespread testing is recommended. All legal migrants in France undergo a mandatory medical check-up at the immigration center (OFII). This check-up is an opportunity to offer rapid HIV and hepatitis testing. A screening questionnaire for risk factors (TROD screen) has been developed and could help target the screening offer. The objective of the STRADA study is to evaluate the efficacy of a screening strategy for infectious diseases (Tuberculosis, HIV, HBV and HCV) based on risk-factor questionnaires amongst migrants during the medical check-up.

Methods:

STRADA is a prospective, multicenter, observational study with two parts: tuberculosis screening (evaluation of a screening questionnaire) and HIV, HBV and HCV screening. For that part we have created a risk-based questionnaire for those three infections. In the first phase of the study, all migrants eligible are offered a screening, the TROD screen questionnaire. In the second phase, the screening offered on the basis of country of origin will be compared to the screening offered on the basis of the risk factor questionnaire. Finally, a cost-effectiveness study will be performed. During the informed consent process, participants are informed that the study is voluntary and independent from the residence permit.

Preliminary results:

A risk-based questionnaire has been created and translated in 10 languages. The screening has been implemented in 20 immigration centers in France. In April 2019, 35,000 participants have answered the TB screen and 8,250 have been screened for at least one of the three virus.

Discussion:

This study will determine the acceptability, performance, utility, costs and impact of a targeted optimized screening strategy for migrants in France. The presence of infectious diseases amongst migrants is a major public health issue. STRADA is an innovative initiative that has the potential to improve screening.

Screening TB in asylum seekers in Switzerland: comparing chest X-ray and interview-based system

Jean Pierre Zellewegerjp

Y Jackson[1], JP Zellweger[1]

[1]Swiss Lung Association, Berne, Switzerland

Contact: zellwegerjp@swissonline.ch

Setting:

Mandatory initial screening of asylum seekers for tuberculosis (TB) in Switzerland, 2004-2005 and 2007-2008.

Objective:

To compare the yield of screening by chest radiography with an individual assessment based on geographic origin, personal history and symptoms.

Design:

Cross-sectional retrospective comparison of two 2-year periods.

Results:

The prevalence of detected TB cases was defined as the proportion of screenees starting antit tuberculosis treatment for culture-confirmed pulmonary TB within 90 days. TB prevalence was 14.3 per 10 000 asylum seekers screened (31/21 727) using chest radiography and 12.4 (29/23 402) using individual assessment. The sensitivity of radiography was 100% vs. 55% for individual assessment, but its specificity was lower (89.9% vs. 96.0%, respectively). The higher sensitivity of radiography meant shorter delays between screening and start of treatment (median 6 vs. 25 days). Its lower specificity led to a larger proportion of screenees needing further investigations for suspicion of TB (12% vs. 4%).

Conclusions:

The interview-based system initially missed more cases, but the ultimate 90-day yield was comparable for the two periods. The main difference is the delay until start of treatment, which potentially increases transmission and secondary cases. The radiograph system was more burdensome to both the health care system and the screenees, as more suspects required further investigations.

Integrating HBV, HCV and HIV screening in tuberculosis entry screening for migrants in the Netherlands

Janneke Bil

J Bil[1], PAG Schrooders[2], M Prins[1,3], PM Kouw[1], JHE Klomp[4], M Scholing[5], L Huijbregts[2], GJB Sonder[1,3], T Waegemaekers[6], A Tostmann[1,3], Health, Netherlands, EuroHealthNetChair persons: Yvette Shajanian Zarneh - Germany, Anne-Catherine Viso - France

[1] Department of Infectious Diseases, Public Health Service, Amsterdam, Netherlands

[2] Department of Infectious Diseases, Public Health Service of Noord- en Oost-Gelderland, Warnsveld, Netherlands

[3] Department of Internal Medicine, Amsterdam Infection and Immunity, Academic Medical Center, Amsterdam, Netherlands

[4] Department of Infectious Diseases, Public Health Service of Gelderland Zuid, Nijmegen, Netherlands

[5] Department of Medical Microbiology, Onze Lieve Vrouwe Gasthuis, Amsterdam, Netherlands

[6] National Coordination Centre for Communicable Disease Control, RIVM, Bilhoven, Netherlands

[7] Department of Primary and Community Care, Radboud University Medical Center, Nijmegen, Netherlands

Contact: jbil@ggd.amsterdam.nl

We evaluated uptake and diagnostic outcomes of voluntary hepatitis B (HBV) and C virus (HCV) screening offered during routine tuberculosis entry screening to migrants in Gelderland and Amsterdam, the Netherlands, between 2013 and 2015. In Amsterdam, HIV screening was also offered. Overall, 54% (461/859) accepted screening. Prevalence of chronic HBV infection (HBsAg-positive) and HCV exposure (anti-HCVpositive) in Gelderland was 4.48% (9/201; 95% confidence interval (CI): 2.37-8.29) and 0.99% (2/203; 95% CI: 0.27-3.52), respectively, all infections were newly diagnosed. Prevalence of chronic HBV infection, HCV exposure and chronic HCV infection (HCV RNA-positive) in Amsterdam was 0.39% (1/256; 95% CI: 0.07-2.18), 1.17% (3/256; 95% CI: 0.40-3.39) and 0.39% (1/256; 95% CI: 0.07-2.18), respectively, with all chronic HBV/HCV infections previously diagnosed. No HIV infections were found. In univariate analyses, newly diagnosed chronic HBV infection was more likely in participants migrating for reasons other than work or study (4.35% vs 0.83%; odds ratio (OR) = 5.45; 95% CI: 1.12-26.60) and was less likely in participants in Amsterdam than Gelderland (0.00% vs 4.48%; OR = 0.04; 95% CI: 0.00-0.69). Regional differences in HBV prevalence might be explained by differences in the populations entering compulsory tuberculosis screening. Prescreening selection of migrants based on risk factors merits further exploration.

7.C. Workshop: Best practice portals for public health policies and interventions

Organised by: Federal Centre for Health Education, Germany, National Institute of Public Health, Netherlands, EuroHealthNet

Contact: yvette.shajanian-zarneh@bzga.de

Background:

To support policy and practice with evidence-based information, several countries have best practice portals for public health interventions. Some of the portals were started recently (France) and other portals exist already for several years now (Netherlands). All the countries face the same challenges, which relate to how to identify the relevant practices, the assessment of the practices (how to achieve an inclusive portal while maintaining high quality), and the implementation and the use of the practices by professionals and policymakers (integrity vs. adaptation of the best practices). In addition to best practice portals the organisations are also working on the development of What works approaches.

Objective:

The organisers will share their experiences with the development and implementation of best practice portals, and discuss the successes and challenges with the workshop participants.

Three countries (the Netherlands, France and Germany) will present the successes and challenges of their best practice portal, and, as an example of a joint European approach, EuroHealthNet will discuss both joint and independent approaches from a European perspective. At the end of the workshop we will discuss the challenges and invite other countries to share their experiences and successes with best practice portals and providing evidence for policy and practice.

With the objective to:

- Present the procedure and the assessment criteria of evaluating practices for inclusion in the portals
- Present the implementation and the use of best practices as well as the acceptance of the portals
- Discuss the issues of integrity and adaptation and how to assess the core elements of effective interventions
- Discuss the development of what works approaches (description of evidence in a short and accessible way) and their added value to best practice portals
- Discuss the value added of best practice portals, including promotion of their use by professionals and policymakers

Key messages:

- This workshop will give participants insight into best practice portals developed across Europe.
- It will discuss how countries identify and select good practice and evidence-based preventive interventions as well as the successes and challenges of such portals.

The good practice portal in Germany and considerations towards integrating best evidence

Yvette Shajanian Zarneh

Y Shajanian Zarneh[1]

[1] Unit International Relations, Federal Centre for Health Education/BZgA, Cologne, Germany

Contact: yvette.shajanian-zarneh@bzga.de

The good practice portal of the Federal Centre for Health Education / BZgA consists of a nationwide collection of projects and interventions to promote the health of socially disadvantaged groups at the community/setting level. Currently the portal includes 3067 practices, out of them 124 fulfil the good practice criteria and have been identified as such.

The portal aims to disseminate (good) practice in Germany, promote its translation into action, create transparency in terms of quality criteria and make the diversity of practice more visible. A secondary aim is to promote regional networking and the exchange of experience. To this end, an exchange platform (inforo) is also offered via the operating agency, which however is still limited in use.

The portal does not intend to identify the most effective practices, but to be a database of well-described interventions that were feasible to implement in Germany. Therefore, the evaluation process was designed as a mutual advisory process: Standardized description of project owners according to 12 good practice criteria- review by experts from the responsible coordinating offices of Equity in Health - peer evaluation by another coordinating body in another federal state - and finally evaluation by an expert from the nationwide working group at the BZgA. Thus, the evaluation process is also set up to promote mutual learning with the goal of in turn increasing quality of the practice nationwide, with the advantage of being close to the implementation needs and the potential disadvantage of lacking objectivity.

At the moment, BZgA is assessing different possibilities to integrate evidence as criteria into its good practice portal. Therefore, this presentation will end with a discussion on possibilities to integrate the identification and selection of evidence-based/evidence-informed preventive interventions, including the use of evidence criteria and quality of evidence.

Innovative strategies for the implementation of best practices

Djoeke Van Dale

D Van Dale[1], *K Leenaars*[1]
[1]Centre for Healthy Living, RIVM, Bilthoven, Netherlands
Contact: djoeke.van.dale@rivm.nl

The Netherlands' best practice portal for health promotion interventions includes approximately 350 interventions. The aim of the portal is to support policy and practice with evidence based information. There are five different levels to indicate the strength of their evidence base. In 2014, a study on the implementation of the best practices included in the portal showed that health promotion practitioners often do not implement them. One of the arguments given to opt for other interventions than those listed in the portal was the assumption that the 'standard interventions' will not fit their particular local context, and that adjusting a best practice is not possible.

We will present the criteria and procedure of the assessment of the quality, effectiveness and the feasibility of health promotion interventions. There after we present two strategies to increase and improve the take up of best practice implementation. The first strategy is to describe and present the core elements of the interventions. This strategy facilitates the possibility for the sound adjustments of a best practice. The second strategy is to identify the common effective elements of a group of interventions, and present that information in an accessible way to policy-makers and practitioners. Effective elements were identified through systematic reviews in combination with focus group interviews with health promotion practitioners. The result is a What works document (What works, What probably works, What doesn't work and What's unclear).

An example of the second strategy is a synthesis of the effective elements of fall prevention interventions. These elements were translated into a practical user's guide, and illustrated with best practice interventions from the portal. Policy-makers and health promotion practitioners appreciated the new way of presenting the best practices.

Challenges to create an evidence-based programme register in France

Pierre Arwidson

P Arwidson[1], *C Verry-Jolive*[1]
[1]Public Health France, Paris, France
Contact: Pierre.ARWIDSON@santepubliquefrance.fr

The majority of health promotion and disease prevention interventions implemented in both targeted and general populations have unknown effectiveness. This contrasts with drug treatments which must be proven effective before they can be prescribed. The recent evaluation of four addiction prevention interventions chosen by public health implementers showed that two had positive impacts on addiction prevention and two had deleterious effects.

Despite over 50 years' worth of scientific literature on the evaluation of health promotion and disease prevention programmes, it is little known and little used by project promoters. These promoters cannot be blamed for not using this literature as it is often difficult to access, to read and to understand. Even if they successfully access and read the articles, interventions are often not described properly, rendering the text useless for implementers. It is therefore necessary to create interfaces that translate this literature into a form useful for funders and project promoters.

As a result, Public Health France has studied existing portals in both the United States and in Europe. An independent double-reviewing process comparable to the review process used by scientific journals for manuscripts as in the Norwegian portal was chosen for this reason.An expert committee has worked during more than one year to design and test a scoring grid that will be published soon.

The 80+ programme evaluations found in the scientific literature will now be reviewed with the approved grid.

Public Health France has also begun visiting each region in France to present the portal to local health authorities and NGOs to enable project promoters to submit their programmes soon and to promote the use of evidence-based or research-based programmes when possible.

Development and use of best practice portals: a European perspective

Alison Maassen

A Maassen[1], *A Maassen*[1]
[1]EuroHealthNet, Brussels, Belgium
Contact: a.maassen@eurohealthnet.eu

Across Europe, a number of best practice portals are in different stages of planning, implementation, and evaluation. At the European level, joint best practice initiatives are also underway, notably the Best Practice Portal of the Steering Group on Health Promotion and Disease Prevention managed by the European Commission's Directorate General of Health and Food Safety (DG SANTE), as well as topic-specific portals such as the Xchange portal managed by the European Monitoring Centre for Drugs and Drug Addiction (EMCDDA) and best practice databases from European projects (such as INHERIT on health and sustainability) or Joint Actions (CHRODIS). This presentation will look at how joint European initiatives such as these can successfully link with initiatives at the national level, as well as how they can support the achievement of international objectives such as the United Nations' Sustainable Development Goals (SDGs).

This presentation will also provide an overview of learnings and key takeaways from the Developing Health Promotion and Disease Prevention Best Practice Portals workshop, hosted by BZgA and EuroHealthNet in Cologne, Germany in June 2019. We will present further collaboration and learning conducted by participants subsequent to the June workshop.

Finally, the presentation will kick off the debate following the presentations on the value added of best practice portals and how to promote awareness, engagement, and uptake by professionals and policymakers - both of specific best practices and the portals themselves. This exercise will draw on examples from countries across Europe, as well as from European projects such as CHRODIS+, and look at ways to evaluate the success of portals, as well as practical concerns such as transferability, ownership and scalability.

7.D. Round table: The new EUPHA strategy 2020-2025: what are the new skills public health professionals need

Organised by: EUPHA
Chair persons: Dineke Zeegers Paget - EUPHA, Marieke Verschuuren - Netherlands
Contact: d.zeegers@euphaoffice.org

2019 is the last full year of the EUPHA strategy 2014-2020: Voicing knowledge. Enhancing capacity. The 2014-2020 strategy has allowed EUPHA to strengthen capacity building throughout Europe and has given our EUPHA sections and EUPHAnxt the visibility they deserve. Voicing knowledge has made big steps forwards with the help of our two presidents: Martin McKee and Natasha Azzopardi Muscat. But society has changed, new threats (fake news) are surfacing, old threats (measles) are coming back and EUPHA and its members need to adapt. In 2018, a working group was installed with representatives from our members, our sections, our Executives and EUPHAnxt to discuss what EUPHA should focus on in the next 5 years. The new strategy has (hopefully) been adopted by all our members in November 2019 (the day before the conference) and is presented here.

Next to the new strategy, EUPHA will have to develop a 5-year work plan to describe what needs to be done to achieve this strategy. More importantly, what is expected of the public health network. What skills do they need? How should the training, life-long education be shaped?

In this workshop, we will first present the changing environment (McKee), followed by a presentation on our new strategy (Azzopardi Muscat and Nagyova). We will than have a Round Table with representatives of our members and of our partners. Questions to be discussed/answered are: do they have these skills already, how can we move forward, what is missing.

Round Table members:

- Danijela Stimac, Croatian Public Health Association
- Yves Charpak, French Society of Public Health
- Jorid Grimeland, Norwegian Public Health Association
- Pasquale Cacciatore, EUPHAnxt
- Walter Ricciardi, Italian Society of Hygiene, Preventive Medicine and Public Health, president-elect of the World Federation of Public Health Associations
- Kasia Czabanowska, ASPHER immediate past president

Key messages:

- Public health will be stronger when we plan collaborative actions.
- Evidence to policy should focus on actionable recommendations.

The changing context of public health in Europe

Martin McKee

M McKee[1]
[1]Department of Public Health & Policy, LSHTM, London, UK
Contact: martin.mckee@lshtm.ac.uk

From a public health perspective there is much to celebrate. Europe enters the third decade of the 21st century with a population that has never been healthier. Advances in knowledge, from basic sciences to public health, have transformed our ability to tackle the diseases that afflict our populations. It would be easy to become complacent. Yet, at the same time, our world is transforming rapidly and profoundly. Changing demographics, globalization, technological developments, climate change, shifting public opinions on the value of scientific evidence, a political arena that increasingly seems to focus on highlighting differences rather than looking for common ground: all these trends result in massive and complex societal challenges, which will place great strain on our public health and health care services. In addition, deep and persistent health inequalities within and between countries continue to demand action. New threats (e.g. fake news) are surfacing, old threats (e.g. measles and TB) are coming back and EUPHA and its members need to adapt. This presentation will survey the changing public health landscape in Europe and globally, highlighting key issues for EUPHA to address.

EUPHA strategy 2020-2025: Achieving a triple A rating for health in Europe

Natasha Azzopardi Muscat

N Azzopardi Muscat[1,2], *D Zeegers Paget*[1], *M McKee*[1,3], *M Verschuuren*[1,4], *I Nagyova*[1,5]
[1]EUPHA, Utrecht, Netherlands
[2]University of Malta, Valetta, Malta
[3]Department of Public Health & Policy, LSHTM, London, UK
[4]RIVM, Bilthoven, Netherlands
[5]PJ Safarik University, Kosice, Slovakia
Contact: natasha.azzopardi-muscat@um.edu.mt

The challenges we face are complex in nature, and require multidisciplinary and intersectoral action at different governance levels. Therefore, EUPHA will reinforce its two-tier approach. On the one hand, we will support our members in providing high quality and efficient public health and health care services in European countries, regions and local communities. On the other hand, we will advocate for health and support evidence-informed health policy-making at the international level. Stimulating and facilitating mutual learning and the exchange of knowledge and experiences across experts, members and countries will be an essential element of EUPHA's approach. Not only with a focus on optimal support for our members, but also with an explicit focus on overcoming health inequalities within and between European countries.

Our new vision is to enable everyone in Europe to achieve the highest possible level of health by providing independent and authoritative analysis of the evidence, combined with targeted advocacy to achieve co-ordinated action by all key stakeholders. Our vision:

- builds on the commitments of our governments and international agencies to achieve the health-related Sustainable Development Goals;
- recognises the importance of placing Health in All Policies;
- draws on the Vienna Declaration to embrace the entire range of health determinants, including the biological, social, environmental, occupational, political, and commercial, the health care system, and everything that influences the health of our planet.

Our mission will be:

1. To ensure that there is a strong evidence base, built on sustained investments in data, research capacity, and knowledge translation in all parts of Europe that can inform policies that impact on health;
2. To identify, develop, and advocate for actionable policy recommendations to improve health;
3. and
4. To support capacity-building and collaborations that can achieve public health action.

7.E. Workshop: Everything you always wanted to know about EU health policy but were afraid to ask

Organised by: Observatory
Chair persons: Matthias Wismar - European Observatory
Contact: slgreer@umich.edu

Objective:

The EU is often criticized for being 'market-driven' and practicing a form of 'cold integration'. Any attempt, however, to strengthen solidarity and social integration in the EU is met by stakeholders in the member states with reservation and often outright refusal, arguing that health systems are national competence subject to the subsidiary principle.

This conundrum of asking for more but allowing for less has blocked a scientifically informed public debate about the EU and health policy.

The overall objective of this workshop is to discuss how health research can contribute to resolve this conundrum making the EU more conducive to the needs of health systems, public health (PH) and Health in All Policies (HiAP).

To this end we will review the following 4 specific topics

- What are is EU-health policy and what other policies are affecting health and health systems?
- What tells us the projected Brexit-impact on the UK health system and PH about the value of EU health policy?
- Are EU-trade policies shaping healthier commercial determinants of health?
- What is the added value of cross-border care at and beyond border regions?

This workshop is based on the update of the seminal volume "Everything you always wanted to know about European Union health policies but were afraid to ask" (2019, 2nd edition).

Key note Scott Greer:

In health and health systems the European Union is ubiquitous. Health systems in Europe are hard to figure without the cross border mobility of health professions. Patients going cross-borders. We have a European Medicines Agency that is regulating key aspects of the pharmaceutical market. Health systems have become part of the economic governance of the EU.

In PH we have the ECDC, a PH programme and policies on health related consumer protection and may mechanism that should protect European citizens from scourges that know no borders.

With health in all policies, the EU legislates literally on all known agents and, when in doubt, is using the pre-cautionary principle to protect citizens from health hazards.

All this is supported by a large EU research programme.

Panellist 1 N Fahy, the projected impact of Brexit on health system functions of the United Kingdom demonstrates how deep the integration goes and how beneficial it is for both health systems and public health.

Panellist 2 H Jarman: The discussion around the Transatlantic Trade an Investment Partnership (TTIP) have risen worries about privatization of health services and lowering of food standards. But TTIP is only the tip of the Iceberg given that the EU has several types of trade agreements with many countries and groups of countries, shaping the commercial determinants of health.

Panellist 3 W Palm: Cross-border collaboration is already taking place in many border regions. The European reference networks demonstrate the value of the cross-border collaboration beyond border regions, as does collaboration for joint purchasing and health workforce development.

Key messages:

- Health is important at the EU level and the EU level is important for health.
- Not shaping health and health systems at EU level will limit the perspectives of EU integration, health system development public health and HiAP.

7.F. Skills building seminar: How can data on adolescents' health behavior contribute to public health policies? Lessons from HBSC

Organised by: EHESP French School of Public Health
Chair persons: Emmanuelle Godeau - France
Contact: emmanuelle.godeau@ehesp.fr

Adolescents (10-19) are usually thought of as rather healthy and as low users of health care compared with other age groups. Nevertheless, adolescence is a crucial and challenging transitional journey towards adult life, a time when protective health behaviours and the value of a healthy lifestyle can be adopted, or not, depending on complex interactions between determinants and individual factors. Integration of young people's health in all policies and research agendas is crucial, beyond the health sector, and keeping in mind the needs to reduce health inequalities and to ensure equitable access to services, in a broad Public health perspective.

However, Public health policies targeting young people cannot be fully relevant and efficient if they do not rely on quality data collected among young people, on their health and their health behaviours.

Under the auspices of WHO, the Health behaviour in School-aged children (HBSC) survey collects data among 11-13 and 15 years-old students since 1982, in a growing number of mostly European countries, every 4 years, through anonymous self-completed questionnaires filled in in class, using shared validated instruments and methods.

Our workshop aims at showing how data collected among adolescents, by improving our understanding of their health and health behaviours as well as their determinants and settings, can be used to inform and improve policies at national level. HBSC will be used as an exemple, because of its longevity, breadth, expertise, reputation and uniqueness in the field of adolescent health.

Five contrasted experiences will be presented, illustrating the relevance of linking scientific evidence and policy relevance in a Public health perspective. They have been chosen to offer various perspectives in terms of countries (Ireland, Luxembourg, Israel, UK), topics (well-being, suicide, substance-use, school-health), and levels of links between research and policy.

All presenters are skilled researchers, have a longstanding experience of conducting the HBSC survey and they share a strong interest in linking with policy makers in advocating the improvement of the health and well-being of the adolescents in their country.

Because they all work on the same population (adolescents), and mainly work on the same survey (HBSC), the presentations and debates will start from a common ground, saving space and time to really illustrate how health behaviour data can inform Public health policies. The presenters should give contrasted perspectives, without denying their failures and difficulties, to engage with the audience for a wider discussion, towards a better partnership between research and policy.

Key messages:

- There are national examples that illustrate that research on adolescents' health behaviour can inform Public health policy targeted at this specific population and improve its health and well-being.
- Networking and exchanging on failures and success through case studies can provide perspectives to other teams and countries on how to better build the link between researchers and policy makers.

Using HBSC data as part of Ireland's key policy documents: the example of wellbeing

Michal Molcho

M Molcho[1]
[1]Department of Children's Study, National University of Ireland, Galway, Ireland
Contact: michal.molcho@nuigalway.ie

This paper examines the importance of understanding well-being in childhood and adolescence, and will present Ireland's efforts to develop a set of national indicators of wellbeing that are published every two year in the State of the Nation's Children Report. One of the main source of population based indicators of wellbeing in Ireland is the Irish Health Behaviour in School-Aged Children (HBSC). The HBSC Study in Ireland collects data from 10-18 year olds children since 1998, using a self-completion questionnaire. Data are collected every four years using standardised procedures for sampling and data collection. The same procedures are used since the initiation of the study in Ireland allowing for both cross-country comparison and time trend analysis. As part of the efforts to develop the Irish set of indicators of wellbeing, the HBSC group used a participatory research with children to identify what makes children happy, and the indicators identified by children are now routinely collected. The paper will present these indicators and how they were developed. Most recently, the HBSC study group was asked to develop indicators to the new National Policy framework for children and young people, Better Outcomes Brighter Future, to fill in the gaps in existing knowledge. This further expands the role that the HBSC study in Ireland has in informing policy and in providing data for assessing its success. The paper will present the indicators that are currently used for both national documents, as well as how these were developed.

Using data from the HBSC study for evidence-based suicide prevention in Luxembourg

Claire van Duin

C van Duin[1], *C Catunda*[1], *A Heinz*[1], *H Willems*[1]
[1]Inside Research Unit, University of Luxembourg, Esch-sur-Alzette, Luxembourg
Contact: claire.vanduin@uni.lu

Issue:

As suicide is the second leading cause of death for young people, WHO aims to reduce the suicide rate with 10% by 2020 worldwide. In Luxembourg, organization D'Ligue coordinates suicide prevention. Since suicide research has been carried out in the country for a few years only, data on adolescent suicidal ideation is lacking. Therefore, D'Ligue has contacted the Luxembourg team of the international Health Behaviour in School-aged Children (HBSC) study, to identify risk factors for suicide behaviour and derive recommendations from them.

Description of the problem:

First, our practice partner wanted us to provide them with basic data on the suicidal ideation of adolescents: How many adolescents are suicidal and what are risk factors? Second, recommendations for practice should be derived from the results. To this end, the HBSC data (2014) of 5262 pupils aged 12-18 were analysed.

Results:

15.1% of adolescents thought about suicide last year and 7% attempted suicide. Of the 24 risk factors examined, 12 were found to be significant, with three being particularly important: multiple health complaints (OR: 1.3 for each health complaint, $p < 0.001$, CI: 1.18 - 1.33), lower life satisfaction (OR: 1.3 for the loss of each life satisfaction point, $p < 0.001$, CI: 1.17 - 1.33) and frequent physical fighting (OR: 2.4, $p < 0.001$, CI: 1.57 - 3.74).

Lessons:

Risk factors for suicide behaviour known from research have been confirmed for Luxembourg. What is new is that the number of health complaints is the most important risk factor for Luxembourgish adolescents. Therefore, a list of 8 health complaints was validated as a screening tool for suicidal thoughts. In a further step, this tool could be used, for example, by school nurses. The HBSC data can be used to update the national suicide prevention plan.

Main messages:

HBSC data are used to:

- update the Luxembourgish national plan for suicide prevention.
- investigate a screening tool for adolescents at risk for suicide.

School Health Research Network Wales: Development, implementation & contributing to public health policy

Gillian Hewitt

H Young[1]
[1]DECIPHer, Cardiff University, Cardiff, UK
Contact: HewittG@cardiff.ac.uk

The School Health Research Network (SHRN) was launched in Wales in 2013 as a strategic partnership between Cardiff University, Welsh Government, Public Health Wales (part of the National Health Service) and Cancer Research UK (a research-focused charity). SHRN is led by a multidisciplinary team in the Centre for the Development and Evaluation of Complex Interventions for Public Health Improvement (DECIPHer) at Cardiff University.

SHRN aims to: 1) provide health and well-being data from a biennial survey for national, regional and local stakeholders, including schools; 2) co-produce school-based health improvement research for Wales; and 3) build capacity for evidence-informed public health policy and practice.

Building on and integrating with HBSC infrastructure, a transdisciplinary complex adaptive systems (T-CAS) approach has been employed to develop SHRN, for a national culture of prevention for school health improvement. The T-CAS approach focuses on key stages and activities within a continuous network cycle to facilitate systems level change. The five key stages involve establishing transdisciplinary strategic partnerships, resource investment and linkage, network development, coproduction activities and reciprocal outputs.

SHRN has successfully established new cross-sector stakeholder partnerships at multiple levels, and embedded network activity within national and local policy. It has established a programme of school engagement activities to secure membership of 212 (100%) secondary schools in Wales and building on HBSC systems and structures has developed a national data infrastructure with the biennial collection of student and school-level health and wellbeing data. SHRN has co-produced scientific evidence and established a new data-led planning system (e.g. 56 research studies co-produced). It has also secured sustainability funding from health and education, while developing research capacity to generate evidence and support professional practice.

Learning from success: implementation & evaluation of a national program

Yossi Harel-Fisch

Y Harel-Fisch[1]
[1]International Research Program on Adolescent Well-Being and Health, Bar Ilan University, Tel Aviv, Israel
Contact: harelyossi@gmail.com

The WHO - Health Behavior in School-Aged Children (HBSC) cross national survey, has monitored changes in youth alcohol use throughout the past 3 decades in over 45 countries in Europe and North America. While Israel has usually shown relatively low rates of adolescent smoking, drinking and drug use, the rates of problem drinking increased dramatically during the years 1994-2009. The rate of binge drinking in P30D for teens aged 11-15 tripled from 6.2% in 1994 to 20.6% in 2009. Findings were cleverly used to impact policy. The scientific evidence were disseminated to the press and targeted parliament and cabinet members. Consequently, the government funded the development and implementation of a comprehensive, long-term national program to reduce alcohol drinking among youth. The program was funded and implemented in three consecutive stages: 2010-12, 2012-14 and 2014-16 and was coordinated by the Israel Anti-Drug Authority. HBSC data were used as the monitoring system of the program. Activities included: implementing a comprehensive national strategy, building partnerships with relevant agencies, developing consistent and coherent messages, implementing national media campaigns, passing and enforcing a host of new legislation, implementing a wide variety of age and culture-specific school programs, and implementing community-based interventions. HBSC findings show that as a result of this national intensive program, binge drinking by Israeli youth dropped from 20.6% in 2009 to 12.4% in 2011, to 10.7% in 2014 and finally to 6.2% in 2019. All in all, binge drinking dropped to about one third of its magnitude in 2009, prior to the implementation of the national program. The paper discusses the unique role of HBSC in identifying a critical increase in binge drinking, influencing decision makers, providing base-line data for the national program and serving as its evaluation system.

Biosocial perspectives on adolescent wellbeing: time trends and cross-national patterns

Candace Currie

A Morgan[1]
[1]GCU, London, UK
Contact: Candace.Currie@gcu.ac.uk

Since 1985, the HBSC Study has conducted 9 quadrennial surveys. There has been a growing number of HBSC participating countries over the 3.5 decades - from 5 to almost 50, in Europe and North America. In total there have been 298 national HBSC surveys and data collected from more than 1.5 million 11, 13 and 15 year olds. This paper asks - 'What have we found out about adolescent mental health' from this enormous research endeavour?

1000 papers have been published from HBSC and of these, just over 10% (120) have a primary focus on mental health. Notwithstanding the complexity of how mental health is conceptualized in each case, the 120 abstracts were scanned and empirical evidence was organised according to Bronfenbrenner's bio-ecological model in order to synthesise key findings, in order to evaluate: where there were significant contributions to knowledge/understanding of mental health; where this was limited and where real gaps existed.

A vast array of topics was explored on adolescent mental health with a strong focus on the effects of bullying, the school environment and social and economic inequalities. There was a lack of attention to the importance of friendship and prosocial behaviour. Apart from parents, the role of family members, including grandparents and siblings, in supporting or negatively impacting mental health, was neglected. It was concluded that a deeper investigation is needed into behaviours and social contexts that support positive mental health. The use of the bio-ecological model helped to systematise the evidence to provide an overview of what HBSC has achieved in terms of progressing our understanding of adolescent mental health and where gaps exist.

The implications of this review for HBSC's future development are considered in addition to reflection on what contribution the research to date can make to policy development to improve adolescent health internationally.

7.G. Workshop: Implementing cost-effective policies to reduce the burden of alcohol in the European region: national and local experiences?

Organised by: MILDECA, WHO EURO
Moderators: Carina Ferreira-Borges - WHO EURO, Nicolas Prisse - MILDECA

Countries across the European region have very different approaches to alcohol policies and to their implementation. Presentations by different countries/local authorities will illustrate different interventions taken to reduce alcohol consumption and attributable harm, the effective operational strategy, and the various actors mobilised to promote the coherence and efficiency of inter-sectorial public action (i.e education, health, law enforcement, private sectors). This workshop will contribute to further enabling its participants to set or contribute to set efficient policies aimed at reducing the risks and damages related to alcohol consumption. Moreover, the workshop could result in triggering European synergies and contribute to the promotion and effectiveness of such initiatives.

7.H. Skills building seminar: Population health monitoring goes upstream to improve the uptake of the wider health determinants

Organised by: EUPHA (PHMR), EUPHA (URB)
Chair persons: Nicole Rosenkötter - EUPHA (PHMR), Claudia Costa - Portugal
Contact: nicole.rosenkoetter@lzg.nrw.de

Population health monitoring and reporting provides regular and up to date information on health outcomes, health behaviour, and parameters related to health care. If relevant and possible, information is stratified by sex, age and socioeconomic indicators. Finally, the outputs of routine population health monitoring and reporting aim to inform policy makers and other stakeholders to develop healthy public policies and implement health promoting actions.

However, does the processed data and information really help us to develop a strong and effective narrative on how to improve population health? Alternatively, this information might perpetuate a focus on health care and individualistic solutions for health and inhibits us to frame a narrative focussed on the social, political, and commercial determinants of health.

If we (1) aim to follow a Health in All Policies approach, (2) agree that changes in population health can best be reached if health determinants are tackled upstream, and (3) acknowledge that health is mainly determined outside the health sector, we probably miss parts of the picture with our current routine population health monitoring and reporting activities.

In this workshop, we aim to explore data and information sources that have the potential to expand our general monitoring and reporting focus. The first presentation will focus on the living environment and provides an overview on geospatial information like land use, road and rail networks, amenities, and air pollution, available online at EU level. The second presentation puts the focus on health promoting processes within Finnish municipalities. The tool, that follows a Health in All Policies approach, has emerged to a resource that collects and presents this information routinely. The third presentation will discuss methods for involving the community in making decisions about measuring what is important for their own health and wellbeing. It will also discuss taking their ideas forward and identifying validated tools that can be used to measure what the community want. The last presentation highlights the relevance of policy analysis, for example in the area of food and nutrition, and underlines how this analytical approach can be used to communicate actions needed upstream.

Experts from public health authorities and universities are invited to discuss during this skills building seminar how the focus on the wider health determinants and upstream prevention can be strengthened in routine population health monitoring and reporting. The presentations are followed by an interactive part of 30 minutes to discuss the applicability of the presented approaches and further possibilities to broaden the scope of population health monitoring and reporting.

Key messages:

- The data and information usually used for population health monitoring and reporting lacks information necessary to promote a Health in All Policies perspective and to push upstream prevention.
- To frame narratives that underline the importance of the social, political and commercial determinants of health, we need to expand our data and information sources and include policy analysis.

Geospatial data sources to produce new evidence for routine population health monitoring

Claudia Costa

C Costa[1]
[1]Centre of Studies in Geography and Spatial Planning, University of Coimbra, Coimbra, Portugal
Contact: claudiampcosta@gmail.com

Background:

Many public agencies collect geospatial data in relation to Environment and Territorial Planning. This data is harmonized, standardized, made available online, and it is often collected for a group of countries. These characteristics make this data particularly useful for population health studies, yet in public health there is a certain lack of knowledge with regard to this type of data. The large datasets, the data format and the ways to access this data all hamper their use. The aim of this work is to present an overview of geospatial databases that produce routinely available geospatial data able to support population health monitoring and interventions. The process of how to transform this data in evidence at the local scale will also be highlighted.

Methods:

First, we conducted a survey via the websites of international public institutes with relevant geospatial data gathered for Europe. Second, we identified how we could transform the data into evidence relevant to both, population health studies and decision makers, namely at the local level.

Results:

At the EU level, the European Territorial Observatory Network (ESPON), EUROSTAT, the Joint Research Centre and the Environment European Agency (EEA) are some examples of public agencies both producing and offering access to geospatial data. They are responsible for collecting data regarding, e.g., land use, road and rail networks, amenities and pollution.

Although geospatial data has been compiled all over Europe, it can be used to produce evidence at the local level. For instance, it is possible to extract information on the greenspace area at a local administrative level from the Corine Land Cover project, managed by the EEA, and then, measure the share of area per inhabitant.

Conclusions:

Geospatial data have much more to offer than the obvious location factor. It brings new evidence at the local level, supporting studies and empowering decision-makers at all levels.

TEAviisari – benchmarking health promotion capacity-building in Finnish municipalities

Vesa Saaristo

V Saaristo[1], *PES Hakamäki*[1], *JK Ikonen*[1], *NS Saukko*[1], *KK Wiss*[1], *TP Ståhl*[1]
[1]Welfare and Health Promotion Unit, Welfare Department, National Institute for Health and Welfare, Tampere, Finland
Contact: vesa.saaristo@thl.fi

Issue:

In Finland, municipalities are responsible for promoting public health on local level. However, there hasn't been comparable nationwide information on health promotion processes and resources in different municipalities available. In order to enhance evidence-based management, a nationwide online database and user interface called TEAviisari (http://teaviisari.fi/en/) was released in 2010.

Description:

TEAviisari is based on a generic health promotion capacity-building framework consisting of seven dimensions: commitment, management, monitoring and needs assessment, resources, common practices, participation, and other core functions. Each dimension consists of several indicators. TEAviisari aims to make measures taken by local authorities visible and to provide comparable and objective indicators for the management, planning, and evaluation of health promotion activities in different sectors of administration in all municipalities.

Results:

Most of the data are collected biennially with an electronic form by municipal informants, and complemented with register data. Sectors covered are primary health care; comprehensive, upper secondary and vocational education; sport and physical activity; culture; and municipal management. Exceptionally high coverage (76%-97%) supports the quality of the follow-up data. In order to simplify the interpretation, all data are displayed as summary scores ranging from zero to 100, where 100 stands for a desirable quality. It is possible to drill down into more detailed information, all the way down to single indicators.

Lessons:

Our work shows that it is possible to collect comparable data on health promotion practices and resources in municipalities. TEAviisari offers access to relevant, interpreted information for decision-makers on all levels, serving as an assessment and planning tool for the local government, making their actions transparent to the residents, and providing information for national policy-making.

Measuring health and well-being with the help of the community

Greg Williams

G Williams[1], *A Verma*[1]
[1]Division of Population Health, Health Services Research & Primary Care, The University of Manchester, Manchester, UK
Contact: greg.williams@manchester.ac.uk

Issue:

The Well North Programme is a multi-centre study focused on reducing inequalities in deprived communities through locally-led interventions and activities. As a locally driven project where the local stakeholders were involved in the programme of work, it was important to involve the community when deciding what to measure.

Description:

As part of the evaluation there was a need to produce a tool to capture health and wellbeing information that was relevant to the specific communities involved in the project. In order to do this, we established that we needed local people to define what they wanted to measure, and we would use evidence synthesis techniques to identify tools that could be used to measure it within the community.

Results:

We formulated the Well North Star, a bespoke spider diagram designed to capture individual level data. The Star is a quantitative tool used to collect individual-level data at an individual, organisational and geographical level. Each arm of the star represents an important theme, selected for measurement by local people. Identified local stakeholders (including residents, voluntary sector, police and councillors) were invited to workshops in order to decide what issues were important locally. After group discussions and thematic analysis, up to seven issues were highlighted as the most important in the community. Two of the main issues highlighted within local communities were aspiration and access to local information. After extensive literature search, tools to measure these were insufficient (e.g. aspiration tools focused on aspiration to become famous) and so bespoke tools needed to be created.

Lessons:

When conducting community driven research, it is important to involve representatives from the community in identifying issues that are important to them. There is a gap between what academics and researchers consider important in local communities and what the communities themselves consider important.

Monitoring upstream determinants of dietary health to increase action on nutrition: The INFORMAS initiative

Stefanie Vandevijvere

S Vandevijvere[1,2]
[1]Sciensano, Brussels, Belgium
[2]The University of Auckland, Auckland, New Zealand
Contact: Stefanie.Vandevijvere@sciensano.be

Background:

Efforts for tracking malnutrition in all its forms are increasing. The World Health Organization conducts regular surveys among Member States on implementation of policies to prevent non-communicable diseases (NCDs) through online databases and interactive maps. However, there are critical gaps. One of the main factors contributing to unhealthy diets is unhealthy food environments. Food environments are the collective physical, economic, policy and sociocultural surroundings, opportunities and conditions that influence people's food habits and nutritional status.

Methods:

The International Network for Food and Obesity/NCDs Research, Monitoring and Action Support (INFORMAS) was founded in 2013 and developed a new framework to monitor and benchmark the healthiness of food environments and policies in a standardized way internationally. The framework consists of 7 modules covering different aspects of food environments (e.g. food composition, labelling, marketing, provision) and two tools (focused on policies and business impact) to measure the extent of implementation of priority recommendations to improve food environments by governments and the private sector.

Results:

To date about 30 countries implemented one or several modules or tools of the INFORMAS framework. INFORMAS has conducted several multicountry comparisons and has developed a blueprint country profile for measuring progress on creating healthy food environments. The proposed country profile aims to supplement similar efforts by the Global Burden of Disease in monitoring health risk factors and outcomes.

Conclusions:

This monitoring fills a gap in the available evidence regarding food environments and policies internationally. Monitoring the healthiness of food environments using key indicators is important to strengthen accountability of governments and food companies, and evaluate the impact of their policies.

7.I. Workshop: Reaching out to engaging the risk groups: online respondent-driven methods for public health

Organised by: Netherlands National Institute for Public Health and the Environment
Chair persons: Aura Timen - EUPHA (IDC), Anna Thorson - Sweden
Contact: nora.hamdiui@rivm.nl

Hard-to-reach populations (i.e. those stigmatised, marginalised, underrepresented, or otherwise disadvantaged) such as men who have sex with men and immigrants are at higher risk for infectious diseases. Reaching these populations, studying their behaviour and/or testing individuals for infectious diseases is essential for developing effective prevention programmes and disease surveillance. These populations, however, lack sampling frames making it difficult to collect representative quantitative data using common probability-based sampling methods. Respondent-driven sampling (RDS), a variant of snowball sampling, is an effective method to recruit these populations and to make unbiased population estimates using a statistical model. RDS starts with recruiting a convenience sample of the target population (so-called "seeds"). These seeds are then asked to recruit a number of other eligible individuals of their social network. This process continues which leads to chains of recruitment, with several waves of recruits.

The process of respondent-driven recruitment is very similar to the way infectious diseases such as influenza and mumps transmit through populations. This provides opportunities to use the method with a different aim: the detection of cases within networks. Finding infectious cases is an essential element for prevention of further spread in the population and individual health consequences. Essential as it is to public health, conventional contact tracing is a rather timely, costly and, up to a certain degree, really frustrating activity. Studying and making use of social networks may help to understand and control the spread of infectious diseases transmitted via direct contact. These diseases do not spread at random through a population, but follow the underlying patterns of contact networks. This entails that cases tend to cluster by time and space, and their contact persons are at a higher risk for infection. Same as with RDS, respondent-driven detection (RDD) starts with individuals being asked to recruit relevant contact persons from their network. These contact persons are then asked to do the same, resulting in successive waves of contact persons. A case is reached through contact with a known case, similar to pathogens spreading through these contact relationships. RDD may therefore enhance conventional contact tracing, providing further insight in the extent of outbreaks, in a quick and less laborious manner for public health professionals.

Using three examples from public health practice, this workshop provides participants insights in the methodology of online respondent-driven methods (RDS and RDD), how these provide behavioural and epidemiological knowledge on networks and the spread of infectious diseases, and highlights pre-requisites for successful implementation in practice. Lastly, an interactive discussion will be held with the audience on how attendees can apply these methods for their own public health challenges.

Key messages:

- RDS is used to sample hard-to-reach populations to collect their social, sexual and behavioural information, and to make unbiased population estimates.
- RDD is used to detect infectious cases or clusters of disease.

Example A: Using online respondent-driven sampling among men who have sex with men in Vietnam

Luis Rocha

AE Thorson[1], LEC Rocha[2]
[1]Department of Public Health Sciences, Karolinska Institutet, Stockholm, Sweden
[2]Centre for Business Network Analysis, University of Greenwich, London, UK
Contact: lecrocha@yahoo.com

Men who have sex with men (MSM) represent a key population at enhanced risk of sexually transmitted infections including HIV. HIV incidence rates are increasing amongst MSM in Vietnam. The last prevalence rates estimates range between 4% and 12% in major cities (2014). High rates of syphilis, chlamydia and gonorrhoea have also been reported, including drug resistant gonorrhoea. MSM face a strong cultural stigma, especially predominant in rural areas, which make them hard-to-reach in relation to preventive activities. In this context, respondent-driven sampling (RDS) becomes an efficient solution for sampling as well as for testing health promotive interventions. The high Internet penetration rate makes web-based RDS to enable sampling as well as testing risk reduction interventions, an appealing alternative to reduce costs, increase data reliability and to facilitate project management of complex study designs. In this talk, we will present and discuss the implementation of a nation-wide webRDS study of MSM in Vietnam aiming to collect self-reported sexual health and risk behaviour information. Using the same web-RDS system, we combine RDS with a double-blinded randomised controlled trial to implement an online intervention based on the participants own responses to encourage self-reflection. The system allows us to follow up respondents for several months after the initial intervention to check the consequences of the intervention on individual behaviour over time.

Example B: Using online respondent-driven sampling among Moroccan immigrants in the Netherlands

Nora Hamdiui

N Hamdiui[1], JE van Steenbergen[1,2], A Thorson[3], LEC Rocha[4], A Urbanus[1], A Meiberg[1], A Timen[1,5], M van den Muijsenbergh[6,7]

[6]Program Prevention and Care, Pharos: Dutch Centre of Expertise on Health Disparities, Utrecht, Netherlands
[7]Department of Primary and Community Care, Radboud University Medical Center, Nijmegen, Netherlands
Contact: nora.hamdiui@rivm.nl

The Dutch Health Council recommended chronic hepatitis B (HBV) screening for first-generation immigrants originating from intermediate/high HBV endemic countries. The Council proposed two screening strategies; individual case finding by general practitioners and local screening programmes. Our aim was to explore knowledge and information needs regarding chronic HBV and its screening among Moroccan immigrants in the Netherlands, in order to provide Dutch Municipal Health Services insights on how to inform immigrants. We also studied a randomized recruitment method using respondent-driven sampling (RDS) for a better understanding on how to reach and recruit immigrants for an online questionnaire.

First- and second-generation Moroccan immigrants were asked to fill in an online questionnaire and forward this to four Moroccan contacts. Participants were randomized to one of three recruitment strategies; no incentive for filling in the questionnaire nor for successfully recruiting each contact, an incentive for filling in the questionnaire and for successfully recruiting each contact, and a gamified element as non-monetary incentive to stimulate peer-recruitment.

Preliminary analyses show a sample of 59 Moroccans (17-59 years), of which 63% was second-generation and 76% was female. Of these, 46% would like to have information about chronic hepatitis B, while the average knowledge score was 5.02 (0-10). Over 60% of the participants intends to participate in chronic HBV screening, and would also recommend this to their (grand)parents. Using a monetary incentive seemed to be the best recruitment strategy in terms of the number of waves (max: 3). A gamified non-monetary incentive was least effective in stimulating peer-recruitment (max: 0).

Despite the limited level of knowledge and information need, the majority of Moroccan immigrants had a positive screening intention. The next step is to determine whether our methodology could be applied to reach other immigrant groups.

Example C: Using online respondent-driven detection for communicable disease control

Yannick Helms

YB Helms[1,2], N Hamdiui[1], R Eilers[1], CJPA Hoebe[3,4], N Dukers[3,4], H van den Kerkhof[1], A Timen[1,2], ML Stein[1]

Contact: yannick.helms@rivm.nl

Online respondent-driven detection (online-RDD) is a novel method of case-finding that may enhance contact tracing (CT). However, the opportunities and barriers of online-RDD for public health practice have not yet been investigated from the perspective of public health professionals (PHPs). Therefore, it is unclear what the potential strengths and limitations of online-RDD for CT are.

We conducted a sequential exploratory mixed methods research. First, we conducted semi-structured interviews with Dutch PHPs involved in CT. Questions were derived from the diffusion of innovations theory. Second, we distributed an online-questionnaire to 260 Dutch PHPs to study the main findings in a larger population. We used hypothetical scenario's (scabies, shigella, and mumps) to elicit PHPs' perceptions of online-RDD.

Twelve interviews were held. Response rate to the online-questionnaire was 31% (n = 70). Four themes related to characteristics of online-RDD that influenced PHPs' intention to adopt online-RDD emerged: advantages over traditional CT, task conflicts and opportunity costs, public health risks, and situational compatibility. PHPs believed online-RDD may enhance CT through increased reach, low-key communication options, and saving time. Limitations were foreseen in the delivery of measures, supporting patients and contacts, missing information and contacts, and causing unrest. Online-RDD may be particularly applicable in situations with digitally skilled and literate target populations, low urgency, low time-pressure, and a simple perspective for action. A majority of PHPs (70%) had a positive adoption intention towards online-RDD.

PHPs perceived online-RDD as beneficial to public health practice. Further development of online-RDD should focus on facilitating opportunities for personal contact between PHPs, patients and contacts. A comparative study of 'traditional' CT and online-RDD could yield further insights in the potential of online-RDD for public health practice.

7.K. Workshop: Leaving no one outside: strategies for improving delivery of care undocumented migrants in Europe

Organised by: Platform for International Cooperation on Undocumented Migrants (PICUM)
Chair persons: Alyna Smith - Belgium
Contact: alyna.smith@picum.org

A number of recent publications, including WHO's Report on the health of refugees and migrants in the WHO European region: no public health without refugee and migrant health (2018) and the report of the UCL-Lancet Commission on migration and health have underscored the ways in which vulnerability to poor health outcomes can be exacerbated due to factors related to migration and migration status.

This workshop will explore opportunities to improve delivery of health care, using a practical tool intended to support the design of inclusive health services. This checklist has been elaborated by a coalition of organisations (''Nobody Left Outside'' platform) centred on the situation and needs of underserved populations, including the homeless, sex workers, prisoners, people who use drugs and undocumented migrants. This workshop will aim to test and validate the tool, looking at a particular population: people who are undocumented.

The workshop will aim to:

- Improve understanding of factors that undermine delivery of health services to severely underserved groups, focusing on the specific example of people with insecure residence status.
- Promote understanding of service-design strategies that broadly benefit these groups, applying and validating a practical tool to support inclusive service delivery.

Format: The workshop will aim to be as interactive as possible. Following opening interventions from experts, participants will be invited to share their insights and expertise to validate the service delivery design checklist that will be shared with them, and to identify the necessary policies and practices that wold ensure its effective implementation.

Key messages:

- Test a solutions-based model for the design of health services that addresses underserved groups, focusing on undocumented migrants.
- Identify policies and actors needed to enable effective delivery to ''left behind'' populations.

Santino Severoni

S Severoni[1]

[1]Public Health and Migration Division, WHO EURO, Copenhagen, Denmark
Contact: severonis@who.int

Dr Severoni will present perspective from the World Health Organization on its priorities on UHC and the SDGs, and how these intersect with its work on migrant health at the European and global levels; and the opportunity of the NLO checklist as a tool to support these goals at the national and local levels.

Jeffrey Lazarus

J Lazarus[1,2]
[1]Barcelona Institute for Global Health, Barcelona, Spain
[2]Hospital Clinic, University of Barcelona, Barcelona, Spain
Contact: jeffrey.lazarus@isglobal.org

Professor Lazarus will provide an introduction to the NLO checklist, the rationale for its creation, its intended application, including advancing the Sustainable Development Goals and countries' commitments to achieving universal health care, and its grounding in the WHO Health System's Framework.

Daniel Lopez-Acuña

D Lopez-Acuña[1]
[1]Andalusian School of Public Health, Granada, Spain
Contact: lopezacunad@gmail.com

Dr Lopez-Acuña will present opportunities to advance health equity by making health systems more accessible for people in situations of heightened vulnerability, including due to irregular status, through actions at the local, regional and international levels.

Alyna Smith

A Smith[1]
[1]PICUM, Brussels, Belgium
Contact: alyna.smith@picum.org

Ms Smith with discuss the range of structural barriers confronted by people who are undocumented, in accessing health services, at the policy and practical levels, including intersectional challenges (e.g., for undocumented sex workers, homeless, users of drugs, etc.).

7.L. Workshop: Making progress in Health Impact Assessment: from theory to practice

Organised by: EUPHA (HIA), EUPHA (ENV)
Chair persons: Piedad Martin-Olmedo - Spain, Peter Van Den Hazel - EUPHA (ENV)
Contact: piedad.martin.easp@juntadeandalucia.es

Nowadays, it is widely accepted that the causal pathway leading to an adverse health outcome does not depend on isolate risk factors but on the intricate relation of those elements with broader socioeconomic, cultural, environmental, and political conditions. This comprehensive approach was already acknowledged in the preamble of the constitution of the World Health Organization (WHO) when referring to the concept of ''health''. The so-called social view of health generated under this new framework place also a great emphasis in addressing health inequalities within a population.

Impact assessment (IA) is a discipline involving specific methods and technical tools for analysing the consequences of a planned intervention previously to the implementation phase. Its purpose is to support the decision-making process. Environmental Impact Assessment (EIA) is a form of IA applied to a wide range of public or private projects that are likely to pose a significant impact on the environment.

The EIA Directive (2011/92/EU) was amended in 2014 (2014/52/EU), including explicitly ''population, and human health'' in the list of topics to be considered in an EIA. However, the amended directive does not provide a specific definition for any of the two terms, nor guidance on how to assess the potential health effects related to a project, or the necessary qualifications of professionals tasked with the assessment of these effects. To this respect, public health professionals are not likely to be routine contributors to EIA. In this sense, under a business-as-usual coverage, environmental specialists are the professionals developing standards and methods to assess all topics in EIA, including for population and human health. This runs the risk that EIA practice will lose much of its potential for improving human health.

The International Association for Impact Assessment (IAIA) together with the European Public Health Association (EUPHA), and the WHO European Centre for Environment and Health (WHO-ECEH) are working on a reference document to support public health authorities and other health stakeholders in addressing human health within EIA as required by the Directive 2014/52/EU.

The aim of this workshop is to present that document and discuss with participants about the above-mentioned gaps, for ensuring a consistent coverage of population and human health within the EIA process.

Elements to be discussed:

- -Description of major changes introduced by the amended EIA directive, and its impact on public health
- -Institutional/political support needed for the institutionalization of health assessment within EIA
- -Role of the Public Health sector, and description of what likely or significant effect on health should be considered within EIA
- -Competencies required for assessing population and human health in EIA.
- -Gaining strength from the 'Family of health assessments' approach''

Key messages:

- A comprehensive approach to population and human health should be incorporated in the EIA procedure.
- Raise awareness for involving public health sector in addressing population and human health in EIA.

The amended EIA directive creates opportunities for public health

Environmental Impact Assessment (EIA) is conducted by the developer as part of the process of seeking consent to proceed with the project. The developer may be a public authority or a private company. The Directive for Environmental Impact Assessment (EIA) (2011/92/EU) was amended in 2014 (2014/52/EU). The changes are now transposed into national regulations across European Union Member States. These changes have an influence beyond EU borders, for example, through the policies of the European Investment Bank and the European Bank of Reconstruction and Development. The amendments to the Directive create both opportunities and challenges for public health. The opportunities stem from the changes that have been made to the Directive. Population and human health are now on the list of core topics that must be considered in an EIA. The other core topics to be assessed are each 'determinants of health', for example: biodiversity; land, soil, water, air and climate; and material assets, cultural heritage and the landscape. The Directive now requires the interaction between these factors to be considered. The amended Directive includes other issues that are relevant to human health, for example, climate change and vulnerability (exposure and resilience) to major accidents and/or disasters. The developer's assessment must be prepared by Competent Experts. The changes also pose challenges. These are technical. For example, human health needs to be assessed within the framework of EIA. The changes also pose challenges to the public health workforce. There is a need to ensure there is capacity to participate in EIA. The EIA is typically prepared by the developer and reviewed by the competent authority. There is a role for public health expertise in these complementary activities. This presentation will focus on the opportunities created by the changes to the Directive and the opportunities this creates. It will also touch on the challenges.

Political support for the institutionalization of health assessment within Environmental Impact Assessment

Francisco Javier Rodríguez Rasero

L Moya Ruano[1], *FJ Rodríguez Rasero*[1], *E Madrid Verdugo*[1], *J Vela*[1]
[1]Department of Environmental Health, Regional Ministry of Health, Goverment of Andalusia, Seville, Spain
Contact: francisco.rodriguez.rasero@juntadeandalucia.es

Health Impact Assessment (HIA) as a stand-alone report integrated in environmental impact assessment has been compulsory for the last 5 years in Andalusia. In this time, it has been proven as a successful tool for implementing the Health in All Policies strategy, delivering consistently better outcomes for the examined projects.

The effective implementation of HIA required huge institutional and political support as this choice was very controversial and sparked opposition from developers. They alleged it would worsen the adverse socioeconomic situation and made claims about how it would generate unfair competition for companies in the region.

Nevertheless, the main source of opposition was located within administrations, unaccustomed to collaborative work. There were also fears about the increased bureaucracy and lack of coordination in procedures. It was a major challenge, as it seemed conflicting with other political objectives as achieving economic growth and job creation, while offering doubtful political gains due to difficulty in achieving results in the short term.

The support implied assuming a political leadership focused on the inclusion of health in the government's list of priorities, advocating for the population value as a strategic element. It also meant raising awareness among all sectors by searching for strategic alliances and being prepared to compromise and reach agreements.

It needed technical and organisational leadership too. First, by defining a feasible model of HIA, and then by building bridges between the different sectors. Regarding coordination, several joint instructions have been drawn up to clarify the activities that each organization must undertake, including deadlines and persons in charge. Finally, other successful strategies have been the development of facilitation mechanisms and the provision of specific training courses for developers and administrative staff.

Role of the health sector in EIA

Marco Martuzzi

M Martuzzi[1], *J Nowacki*[1], *B Cave*[2,3], *O Mekel*[4,5], *F Silva*[2,6], *P Martin-Olmedo*[4,7], *Y Xiao*[8], *Th Claßen*[5]

Contact: martuzzim@who.int

EIA is an obligation for many projects in many countries. Consideration of human health within EIA is also an obligation. This results in an invaluable opportunity for early consideration of a variety of environmental health determinants, leading to minimization of noxious exposures and promotion of the salutogenic factors involved in plans and projects in many sectors. In other words, EIA can be an extremely powerful vehicle to scaling up primary prevention - by far the most effective strategy in public health. This opportunity is further enriched by the recent revision of the EU Directive on EIA, which makes better provision for human health considerations in EIA, in particular referring to the need to address "significant" health effects of plans and projects - without elaborating further.

The health sector can play a key role in EIA by: recognizing the opportunity and its potential, so far under-exploited; engage in dialogue with other sectors, on specific applications; make institutional arrangements so as to secure manpower and competences to contribute to EIA; advocate for a high level of human health consideration in EIAs on the ground.

This process requires careful consideration of needs and constraints of EIA, including a need to establish a common language with other sectors, the identification of realistic, achievable goals, as well as long-term objectives, the consolidation of available methods and tools and a need to engage in possibly unfamiliar conversations. A pragmatic, operational decision on what constitutes significant health effects in the context of EIA may be a good starting point to measure the readiness of the health sector to undertake this journey.

Skills and knowledge to facilitate competence for health and wellbeing in Environmental Impact Assessment

Liz Green

L Green[1]
[1]Wales Health Impact Assessment Support Unit, Public Health Wales, Cardiff, UK
Contact: Liz.Green@wales.nhs.uk

Within Environmental Impact Assessments (EIA) any health impact assessed has routinely focused on environmental and socio-economic health determinants i.e. air quality/ emissions. However, the WHO recognises that health is much wider than this and health is influenced by a broad range of determinants, contexts, inequalities and experiences. Proposed development can affect a wide range of population groups and their health and well-being in diverse and significant ways.

The revised EU EIA Directive contains amended wording in relation to health consideration but also now requires 'competent' persons to undertake assessments. Competency can mean different things to different people but a clear set of standards, criteria and appraisal tools, training and professional competence and abilities are needed in order to be explicit to measure this and articulate how competence should be demonstrated in practice.

Findings:

This paper describes a clear set of expected skills and knowledge outcomes that competent practitioners and multidisciplinary teams need to exhibit; which policy makers and commissioners need to seek; and which reviewers should expect see applied, in order to ensure that high quality, fit for purpose EIAs are carried out which include the widest interpretation of health, wellbeing and inequalities. It discusses the work of the Wales HIA Support Unit to train and mentor practitioners and organisations and presents resources to enable this such as its Skills and Knowledge Development Framework, which provides a pathway to develop and support competence in practice, and the Quality Assurance Review Framework for HIA.

Conclusions:
To enable competent broad holistic assessments to be carried out a clear set of criteria, tools, resources and training opportunities are needed in order to enable and facilitate a wide range of personnel to deliver a wide and inclusive health appraisal as part of EIA.

Health in Environmental Impact Assessment (EIA): Gaining strength from the 'Family of health assessments' approach

Rainer Fehr

R Fehr[1], *J Nowacki*[2], *P Martin-Olmedo*[3,4], *Th Claßen*[5], *Th Fisher*[6], *M Martuzzi*[2], *O Mekel*[3,5]
[1]Department of Public Health, University of Bielefeld, Bielefeld, Germany
[2]WHO European Centre for Environment and Health, WHO EURO, Bonn, Germany
[3]EUPHA (HIA), Utrecht, Netherlands
[4]Public Health, Andalusian School of Public Health, Granada, Spain
[5]Division Health Data and Assessments, Campus Development, NRW Centre for Health – LZG.NRW, Bochum, Germany
[6]Public Health, University of Liverpool, Liverpool, UK
Contact: rainer.fehr@uni-bielefeld.de

Background:
For connecting health-related ''scientific knowledge'' and ''policy-making'' with each other, there is a range of approaches, including health reporting, health needs / impact / technology / systems performance assessment as well as evaluative activities. The improved understanding of their communalities and differences provides opportunities for mutual learning and synergetic practice.

Goal and method:
The goal is to strengthen the coverage of health within EIAs. We apply the ''Family of health assessments'' approach, as worked out by the EUPHA ''health assessments'' working group (EJPH 2017, pp.609-16), for connecting EIA to other approaches used to support decision-making.

Results:
Applying this ''family'' approach leads to various insights, including the following: (i) Existing local health (or environmental) reports provide baseline information, as required in impact assessments. (ii) An existing Health Needs Assessment (HNA) can point to vulnerable populations, Health Systems Performance Assessment (HSPA) to specific weaknesses of local health care, potentially relevant for expected impacts. (iii) Where other impact assessments beyond EIA, e.g. Social Impact Assessment (SIA), are conducted, assessors need to be aware of potential overlap or even contradictions which could irritate decision-makers and the public. (iv) Ex-post evaluations of similar projects can inform prospective EIA. (v) The competencies required for assessing human health in EIA overlap with those required for other types of health assessments, e.g., health reporting or evaluation. Therefore, teaching modules might jointly be developed.

Lessons:
The ''family'' perspective helps to make best use of existing (local) knowledge (which is often embedded in diverse forms of health assessments); and to assure consistent practice across assessments. The inter-relationship of health assessments is a reason to reconsider training courses and to develop more integrated approaches.

7.M. Workshop: Cohorts: coordinated tools for decision support

Organised by: French National Institute of Health and Medical Research
Chair persons: Charles Persoz - France
Contact: jean-marie.gagliolo@inserm.fr

Longitudinal cohorts, by allowing to follow over the time a group of persons with common characteristics to identify the occurrence of health events, have proven to be very valuable instruments in medical and public health research. For instance, it is possible to investigate links between exposures (demographic, biological, behavioral, environmental, or genetic) and the occurrence of observed health events. And indeed the applications of the cohorts are multiple: besides public health research (links between risk factors or exposures and disease, health effects of unusual or still unknown exposures), it is possible, for example, to investigate the impact of a therapeutic strategy or complex healthcare intervention on the population status. Therefore, observations resulting from cohort studies are now often at the heart of public policy decision-making.

In addition, health-data collections are increasingly broad in our societies (data from research, care, patient communities, or using personal initiatives such as smartphone applications and connected objects) and heterogeneous (genomic, physiological, biological, clinical, social and environmental). However, the efficiency of these epidemiological studies is limited by many factors, while resources required to develop them are very important. The lack of knowledge of the European landscape, the lack of harmonization of practices or governance or the lack of communication between various stakeholders, have an impact on the strategy to adopt. It would be essential to consider procedures to optimize resources, harmonize methodologies and coordination between structures, in such a context where epidemiological expertise is sometimes scarce and under-resourced. Furthermore, possibilities of international cross-cohorts linkages and collaborations could allow for unique and fruitful research opportunities, impossible to achieve in the setting of a stand-alone cohort.

During this workshop, we propose to present different European initiatives and coordination models, but also to highlight collaborations between these cohorts. This brainstorming would allow us 1) to expose methodologies and best practices, which are developed by the various stakeholders; 2) to identify common or transposable procedures in order to participate in sustainable European strategy and at last, to address the challenges of developing future cohorts and using personal health data. For this purpose, four speakers will present the French landscape developed over the past ten years and three models of cohort coordination and data mining in Europe: the French cohort Constances, the Swedish consortium Cohorts.se and the German National Cohort.

Each participant will speak for 15 minutes. Then the chairperson will lead the workshop's joint discussion with the four speakers and the audience.

Key messages:
- cohorts are one of the reference instruments for epidemiological and public health research, and represent a significant advantage in decision support.
- efforts are need to improve the coordination of these cohorts, both nationally and internationally, to sustain these expensive instruments and foster the development of international collaborations.

Development of a French ecosystem to support cohorts

Sylvain Durrleman

SD Durrleman[1]
[1]Public Health Department, French National Alliance for Life Sciences and Health, Paris, France
Contact: sylvain.durrleman@gmail.com

For a long time, the usual research funding mechanisms in France limited the development of very large databases (funding too low or too short for example). Over the past decade, new measures provided unprecedented momentum in our country to structure large cohorts.

Due to their very broad scope, cohorts are one of the reference instruments for epidemiological and public health research. Cohorts also help to inform decision-making on risk prevention action, enhance the health system or patient care. For these reasons, the French Ministry of Research identified in 2008 cohort as research infrastructures. With this decision, the Ministry recognizes their usefulness for the public health research community, and more broadly for biomedical research. To fund this ambition, a call for proposal was launch in 2010 by the government as part of the 'Investments for the Future>>. A dozen patient or general population cohorts are funded through this process, such as Constances, E4N or others.

The creation of the National Health Data System in 2017 also reinforces the strategic aspect of cohorts. This system is unique in Europe. He allows cohort data to be linked with data from health insurance, hospital data, causes of death, disability data and supplementary health insurance organizations. The challenge of artificial intelligence also follow the analysis of this data flow.

This model is part of a national strategy with several initiatives: joint coordination, shared services (France Cohortes), the France Médecine Génomique plan and the Health Data Hub, as well as the recently announced launch of 4 Institutes for Artificial Intelligence, three out of them having exploitation of health data at the heart of their development strategy. The objective of this intervention will be to present this french integrated model, and mechanisms developed, in terms of tools, resources or staff, at the service of cohorts and researchers.

The Constances cohort

Marie Zins

MZ Zins[1,2,2]
[1]UMS 11, Inserm-USVQ, Villejuif, France
[2]Université de Paris, Paris, France
Contact: marie.zins@inserm.fr

The overarching objective of CONSTANCES is to constitute a research infrastructure based on a large population-based cohort to serve as a versatile, high quality and efficient platform for population health research. Constances is designed as a representative sample of 200,000 adults aged 18-69 at inception living in different regions of France. CONSTANCES, which is accessible to the national and international research community, enables the conduct of valid and well-powered studies in a wide range of scientific domains. For each participant, it combines detailed data collection at baseline, englobing lifestyle, environmental, social, and medical history information, with medical examinations, neuropsychological testing with the added advantage of linkage with two major national administrative data bases (SNDS and CNAV). Further, CONSTANCES collects information about changing lifestyles, environments, health behaviors and health conditions on a prospective ongoing basis. A biobank of blood and urine samples is in the process of being constituted. As of April 2018, 85 nested projects designed by French and international teams in many areas of biomedical and public health research were initiated. Constances participates in several French and international consortiums. We established relationships with public health institutions and industrial companies. In the next years, we plan to continue longitudinal follow-up CONSTANCES along the same lines by extending the follow-up of the cohort and by developing innovative new themes prioritizing the strengthening of certain ''niches'' where CONSTANCES can have international leadership.

The Sweden cohort consortium (Cohort.se)

Johan Sundstrom

JS Sundstrom[1]
[1]Department of Medical Sciences, Uppsala University, Uppsala, Sweden
[2]Uppsala Clinical Research Center, URC, Uppsala, Sweden
Contact: johan.sundstrom@medsci.uu.se

The scientific literature is continuously flooded with non-replicable results from underpowered studies. The insight that very large sample sizes are needed in order to generate robust results has led to the establishment of very large cohorts and cohort consortia in the last decades. Sweden is a country with unique opportunities for epidemiological research. Sweden has a large number of carefully collected population-based cohorts that have been followed for decades, ongoing recruitment into several cohorts, and a variety of high-quality national socio-demographic and medical registries covering the whole population since many decades. However, Swedish cohort research is poorly coordinated. Many research projects are underpowered by using only one cohort at a time, leading to uncertain results with little benefit to patients and the public. We have proposed a coordination of all Swedish cohorts in a common national infrastructure, the Swedish Cohort Consortium (Cohorts.se), aiming to facilitate greater use of Swedish cohorts for better-powered research. Coordination of all Swedish prospective population-based cohorts in a common infrastructure would enable more precise research findings and facilitate research on less common exposures and outcomes, leading to better utilization of study participants' data, better return of funders' investments, and higher benefit to patients and populations. A standing Swedish cohort consortium may drive development of epidemiological research methods and strengthen the Swedish epidemiological competence, community, and competitiveness.

The German National Cohort: aims, study design and current status

Wolfgang Ahrens

WA Ahrens[1]
[1]Leibniz Institute for Prevention Research and Epidemiology, BIPS, Bremen, Germany
Contact: ahrens@leibniz-bips.de

The German National Cohort (GNC) is a joint interdisciplinary endeavour of the Helmholtz and the Leibniz Association, universities, and other research institutes. It focuses on the causes of major chronic diseases, i.e. cardiovascular diseases, cancer, diabetes, neurodegenerative/psychiatric diseases, musculoskeletal diseases, respiratory and infectious diseases, and their sub-clinical stages or related functional health impairments. Less frequent disorders may be investigated by pooling studies. Random samples of regional populations were drawn by 18 study centres, including a total of 200,000 women/men aged 20-69 years. Starting in 2014, the baseline assessments included an extensive interview and self-completion questionnaires, a wide range of medical examinations and the collection of blood, urine, stool and nasal swabs stored in a central biorepository. A random subgroup of $\geq$ 40,000 participants participated in an intensified examination (''Level 2'') programme. Also, about 30,000 participants, who were in addition invited to Level 2, participated in a magnetic resonance imaging examination programme. In 2018 we began to invite all participants for a re-assessment that will be completed in 2023. Information about chronic disease endpoints is obtained through a combination of active follow-up (mailed questionnaires every 2-3 years) and record linkages with cancer registries, healthcare databases, the statutory pension fund and other social insurance data. The examination and questionnaire modules are partly harmonised with those of other large European cohorts to facilitate collaboration. Data access requires a formal application by researchers and will be granted according to the use-and-access regulation of the GNC. The GNC is planned for an overall duration of at least 25-30 years. It will provide a major epidemiological resource, and will help to identify new and tailored strategies for early detection, prediction, and primary prevention of major diseases.

7.N. Workshop: Health literacy: an asset to public health policy

Organised by: EUPHA (HP), Bielefeld University, NIVEL, CAPHRI at Maastricht, University, Newcastle University, Global Health Literacy Academy, M-POHL Network WHOChair persons: Orkan Okan - EUPHA (HP), Jany Rademakers - Netherlands
Contact: orkan.okan@uni-bielefeld.de

Health in all Polices (HiAP), the Sustainable Development Goals (SDGs), the social determinants of health, and health equity all have been recently linked with health literacy. Therefore, it comes as no surprise that health literacy has taken a place in many policy documents in the European Union`s member states. Several national, regional and local health literacy strategies are proof that many governments consider health literacy to be important for their national public health goals. The policy interest in health literacy is also well-documented within countries of the WHO Euro Region, where the political commitment to address health literacy is currently rapidly increasing. Accelerated by the WHO and several of its departments, the uptake of health literacy on policy agendas led to various new activities, such as two policy-related ''Action Networks'' and a ''European Roadmap''. In the light of those recent events, the relevance of health literacy for public health, health promotion and digital health has attracted further NGOs and cross European networks to include health literacy to their working programmes and policy agendas.

In this context, our aim is to: (1) present empirical findings from health literacy policy research projects conducted on European and national levels in the WHO Euro Region and (2) initiate a critical discussion among the audience and the presenters.

The 1st presentation will provide a general overview on health literacy policy initiatives in the EU and the WHO Euro Region, showing interesting results on how most policies focus on health care rather other important arenas of everyday life. The 2nd presentation will compare data from two different European health literacy studies and share in-depth knowledge on the specific policy strategies European countries use, such as national, regional and local level policies, or if countries don`t use health literacy in their health policy frameworks. The 3rd presentation will build upon these presentations and provide results from a health literacy policy analysis regarding children. This is to see if and how health literacy policies address children and what kind of policies and policy instruments are used. The 4th presentation will explore how health literacy is applied in context of cancer. The study will discuss results of systematic analysis of National Cancer Control Plans (NCCPs), which is a public health strategy, regarding cancer literacy and the improvement of quality of life of cancer patients. The 5th presentation will introduce the WHO action network for measuring population and organizational health literacy (M-POHL) and its health literacy survey 2019 (HLS19), an initiative that emerged in context of European health literacy policy making and already comprises 24 European countries.

This workshop offers a forum for people interested in public health policy making with a specific focus on health literacy and will allow discussing results, facilitate exchange, and support further synergies.

Key messages:

- Health literacy policy is an important brick in the Health in All Policies strategy.
- This workshop will address health literacy policy development on national, European and global levels in different populations.

Health literacy policy to promote public health in Europe

Gill Rowlands

G Rowlands[1]
[1]Institute of Health and Society, Newcastle University, Newcastle, UK
Contact: Gill.Rowlands@newcastle.ac.uk

Background:

Health literacy is gaining increasing attention as a means of promoting individual- community- and population-level health, and is key to delivery of the European Health 2020 policy. European policy frameworks promote a holistic approach to policy at multiple levels in society and across multiple arenas in every-day life.

Methods:

An evidence synthesis was undertaken to describe health literacy policies in the WHO European Region: their distribution, organizational levels, antecedents, actors, activities and outcomes, along with the factors influencing their effectiveness. Evidence was obtained by a scoping review of academic literature in English, Dutch and German and of grey literature in English, Dutch, German and Italian, supported by a Region-wide expert enquiry. Emerging findings were presented to representatives from 19 Member States of the Region to check for accuracy and omissions.

Results:

The report highlights much good health literacy policy-related activity, mostly in the health and education sectors. Fewer policy-related activities were identified in other areas, such as the lived environment, employment, the media, and digital health. Robust evaluation of policy-related activities was identified in some, but not all, policies.

Conclusions:

Suggestions are made for policy-makers to share good health literacy policy practice, and to further develop policy aims and activities across all societal areas. An additional need is the development of robust health literacy metrics to direct resources and monitor the effectiveness of policy activities.

Health literacy policies and activities: developments in the past five years

Jany Rademakers

J Rademakers[1,2]
[1]Research Department, NIVEL, Utrecht, Netherlands
[2]Care and Public Health Research Institute (CAPHRI), Maastricht University, Maastricht, Netherlands
Contact: j.rademakers@nivel.nl

Background:

In the past five years, two inventory studies have been performed in which health literacy policies throughout Europe were described and analyzed: the 'Study on sound evidence for a better understanding of health literacy in the European Union'(HEALIT4EU, 2015) and the recent HEN-synthesis report on the evidence on existing policies and linked activities and their effectiveness for improving health literacy (2018). In this presentation, data from these two studies will be compared to identify current developments regarding health literacy policy.

Methods:
The descriptive data of both studies were, amongst others, compared with respect to the number of countries with policies or activities regarding health literacy, the geographical distribution over Europe, the content of the policies and level of implementation.
Results:
More countries have developed policies and activities in the domain of health literacy, or are currently in the process of doing so. However, gaps remain in the geographical distribution of policy, and evidence on the effectiveness of policies and activities is still marginal.
Conclusions:
Health literacy is more prominent on the European policy agenda. Rigorous evaluation is needed to demonstrate possible benefits of the policies for individuals, communities and society as a whole.

Health literacy policy-making regarding children and adolescents

Orkan Okan

O Okan[1,2]*, K Sørensen*[3]*, U Bauer*[1,2]
[1]Faculty of Educational Science, Bielefeld University, Bielefeld, Germany
[2]Interdisciplinary Centre for Health Literacy Research, Bielefeld University, Bielefeld, Germany
[3]Global Health Literacy Academy, Aarhus, Denmark
Contact: orkan.okan@uni-bielefeld.de

Background:
There is an on-going and a well observable uptake of health literacy in the national and international agenda setting pertaining the development of new policy strategies to address the issue of promoting health literacy in whole societies. Even though children have been declared to be a priority target, no research is available that has analysed if and how children are addressed by these policy approaches. Therefore, the aim of this research is to analyse those policies on how they address children.
Methods:
Policy documents on national levels that have been published by February 2019 were retrieved by using a two-pronged strategy comprising of (1) systematic review methods (database and online search) and (2) expert consultation.
Results:
The search has identified 26 policies for 19 countries including case-laws and enacted statues, governmental strategies, polices driven by national key experts, and educational policies. No policies on children's health literacy were found for South America and Africa. The policies differ in many ways, such as their embedding into general health policy making, policy and implementation processes, rationality and networks, and influence of governance. Children are either addressed by (1) specific programmes, (2) school health approaches, (3) their parents, (4) healthcare action, or (5) using a combination of those areas. However, there is almost no evaluation data available nor are these policies underpinned by health literacy evidence generated within the childrenˋs population. Most policies are designed for adult populations rather than children.
Conclusions:
Health literacy has developed into an important health policy-making target. While almost all policies address children somehow, several limitations make it difficult to evaluate the quality of the different policies. To secure and sustain more effective, child-focused policies, current knowledge gaps regarding research on childrenˋs health literacy should be addressed.

Cancer literacy applied in national cancer control plans – from policy to strategic guidelines in the EU

Kristine Sørensen

K Sørensen[1]
[1]Global Health Literacy Academy, Aarhus, Denmark
Contact: contact@globalhealthliteracyacademy.org

Background:
The study concerned a systematic analysis of National Cancer Control Plans (NCCPs) regarding cancer literacy. A national cancer control programme (NCCP) is a public health strategy designed to reduce cancer cases and improve quality of life of cancer patients. Cancer literacy is critically important for cancer patients who must make a complex set of diagnostic and treatment-based decisions at times of physical and emotional distress. Yet, it is unclear to what extent cancer literacy is reflected in cancer strategies such as the NCCPs.
Methods:
The aim was to identify NCCPs from the EU to explore if health literacy or cancer literacy was included as a strategic priority. The NCCPs were retrieved in August to November 2018 from online portals as well as through key informants specialised in public health and health literacy.
Results:
The data collection yielded 45 NCCPs of which 31 originated from the EU Member States. The document analysis revealed that six out of 45 NCCPs specifically included the term health literacy. The countries concern Austria, Belgium, Germany, Portugal, New Zealand and Maryland, the U.S. In addition, only one NCCP entailed the term 'cancer literacý, namely the plan from Maryland focusing on 'oral cancer literacý, specifically.
Discussion:
Although, it is politically recognized that improving the health literacy of the population can be an effective strategy to promote a more (cost)-effective use of the healthcare services and population health the study of NCCPs revealed that 'health literacy' in general and 'cancer literacý in particular, have not yet been commonly implemented as part of NCCPs. The countries who have actively mentioned health literacy, were all countries where health literacy is on the political health agenda in various ways.

The action network for measuring population and organizational health literacy (M-POHL) and its Health Literacy Survey 2019 (HLS19)

Dietscher Christina

C Dietscher[1]*, J Pelikan*[2]
[1]Federal Ministry of Labour, Social Affairs, Health and Consumer Protection, Austrian Government, Vienna, Austria
[2]The Austrian Public Health Institute, Vienna, Austria
Contact: christina.dietscher@sozialministerium.at

The first European comparative survey of population health literacy (HL), HLS-EU, triggered a lot of health policy and health systems responses. In the sense of ''What doesn't get measured doesn't get done'', data seem important to capture the attention of decision makers and to support evidence-informed policy and practice. This is one of the reasons why the WHO publication ''Health Literacy - The Solid Facts'' (2013) demands regular internationally comparative surveys of HL.

Building up on initiatives by HLS-EU researchers and the German-speaking WHO member states, the Action Network on Measuring Population and Organizational HL (M-POHL) under the umbrella of WHO Europe's Health Information Initiative (EHII) was founded in 2018 to achieve this aim. M-POHL's objectives are to support regular measurements of population HL and of organizational HL and to use the results to support evidence-informed policy and practice. A unique feature of M-POHL is that it brings together research and policy: countries typically participate with a research and a policy representative. Experiences so far show that policy representatives in M-POHL find the continuous collaboration with research extremely valuable for maintaining momentum around HL in their respective countries. So far, 24 countries have been involved in M-POHL.

M-POHL uses projects to meet its objectives. Its first project will be the next European comparative survey of population HL, abbreviated as ''HLS19''. This will build up on HLS-EU by using a standard short form of the survey tool for all participating countries, completing it with optional packages on new topics (digital HL, communication and orientation in health care), and allowing for a few country-specific items. Data collection for HLS19 will start in autumn 2019 and last until March 2020. Based on current expressions of interest, between 10 and 14 countries will participate in the survey. An internationally comparative report will be available in 2021.

7.O. Round table: Academic institutions and regional governments: two worlds apart?

Organised by: WHO RHN, Østfold University College, Norwegian University for Life, SciencesChair persons: Francesco Zambon - WHO EURO
Contact: zambonf@who.int

Partnerships can be described as voluntary, equal and binding agreements between different stakeholders about cooperation and efforts towards a common goal. Partnerships are especially seen as a necessary and important factor within governance and for solving complex ''wicked problems''. This is reflected both in the European health policy framework Health 2020 and in the 2030 Agenda for Sustainable Development, where the development of partnerships is described as an important tool for achieving goals and obtaining sustainability. Partnerships between regional governments and academic institutions could be especially important, as many countries in Europe delegate power and responsibility for public health to the regional and local level. As regional academic institutions have local knowledge, they might be in a better position for adding more value into collaboration with the health professionals and policy makers working in regional governments.

However, public health partnerships between regional governments and academic institutions are not straight forward, as the operationalization, conceptualization, and prioritization of public health issues varies across sectors. Several pitfalls for successful partnerships have also been identified, such as hidden unwillingness to share information or resources, rapid policy and organizational shifts, resistant 'silo mentality', and difficulties to establish evidence of impact. When partnerships are made between academic environments and the practical level in the public sector, different views upon what is actually knowledge and evidence, and how to translate knowledge into practice, lead to challenges.

In this workshop, the complex relationships between academia and practice are discussed, both by examining advantages and by taking a critical stance. The results from a survey of 31 regions within the WHO Regions for Health (RHN) on partnerships will be presented, describing the occurrence of partnerships, how public health partnerships are formalized and organized, important enablers, how collaborations are carried out in practice, perceived benefits and success, and experienced challenges. This will further be elaborated on in a panel discussion between representatives from four regions with longstanding experience with public health partnerships between regional government and academic institutions, sharing examples, experiences and good advice.

Key messages:

- Despite representing different worlds, partnerships between regional governments and academic institutions are powerful and effective structures to address public health challenges.
- Sustainable partnerships should patiently be developed through building mutual understanding and trust between motivated individuals representing both academia and regional governments.

Joining two worlds - When academia meets real life and vice versa

Jo Ese

J Ese[1], C Ihlebak[1,2]
[1]Østfold University College, Østfold, Norway
[2]Norwegian University of Life Sciences, Ås, Norway
Contact: jo.ese@hiof.no

Partnerships between academic institutions and actors outside of academia have for some time been considered a universal remedy for solving complex issues in a wide range of fields; ranging from themes as different as commercial developments in innovation clusters to reducing social inequalities or working against climate change. Such partnerships are strongly encouraged by governing bodies, and are sometimes prerequisites for being eligible as applicants for funding schemes like H2020. A proof of the impact this model of cooperation has had, is the fact that partnership is the only organisational structure that has been elevated to be part of the UN17 goals for sustainable development.

Throughout history, academia has had a complex relationship with the society to which it belongs. On the one hand, academia depends on being seen as valuable, often through visible and concrete impact on society. On the other hand, within academia there is a strong norm of academic freedom stating that such freedom is best accommodated for through a certain degree of insulation between academia and society. This way of understanding academic freedom is an important cornerstone of the Humboltian university ideals as well as in the Mertonian CUDOS norms. Practice and policy actors may also find partnerships with academia complex to navigate. However, such partnerships can be valuable through ensuring that policies and developments are based on research findings and best practices. Furthermore, academics may educate and train practitioners, and evaluate and do research on their initiatives. However, partnerships can also be challenging for practitioners, as academics have to follow strict principles for research design and have little room for holding back results that may put the practitioners in a bad light. In this presentation the complex relationships between academia and practice are presented, both by examining advantages and by taking a critical stance.

Partnerships for public health between regional governments and academic institutions – status quo in European regions

Camilla Ihlebaek

C Ihlebaek[1,2], J Ese[2], F Zambon[3]
[1]Norwegian University of Life Sciences, Ås, Norway
[2]Østfold University College, Østfold, Norway
[3]WHO Office for Investment for Health and Development, WHO, Venice, Italy
Contact: Camilla.ihlebak@nmbu.no

The development of partnerships is described as an important tool for achieving goals in the 2030 Agenda for Sustainable Development. Partnerships between regional governments and academic institutions could be important for solving public health issues, as they are often complex, and both academic and practice-related knowledge is necessary. Such partnerships at the regional level might be especially important as many sub-national regions in Europe have considerable responsibility and power in decision-making on important areas such as prevention, health promotion, and health care. The overall aim of this project was to provide more knowledge about public health partnerships between regional governments and academic institutions in different regions within WHO's Region for Health Network (RHN). Through a mixed methods research design, we wanted to identify and describe good examples of existing partnerships, and to investigate enabling factors, challenges, and lessons learned. Information on ongoing partnerships were collected by sending an electronical questionnaire to contact persons of the 43 members regions in the RHN. Based on the mapping, four regions were selected for group interviews with different stakeholders within regional universities and regional government. There were 31 regions (72%) who answered the questionnaire, and group interviews were carried out in Østfold (Norway), Varna (Bulgaria), Utrecht (the Netherlands), and Saskatchewan (Canada). In this presentation the results from the survey will be presented; describing the occurrence of partnerships, how public health partnerships are formalized and organized, important enablers, hindrances, how collaborations are carried out in practice, perceived benefits and successes, and experienced challenges.

7.P. Workshop: Digital quality assurance of equitable public health interventions: why, how and examples

Organised by: Region Västra Götaland
Chair persons: Per-Olof Östergren - Sweden, Maria Magnusson - Sweden
Contact: maria.b.magnusson@vgregion.se

Objectives are to highlight knowledge and experiences of follow-up and evaluation of public health interventions with a focus on health equity. A digital instrument for planning, documentation and quality assurance, used in several Swedish settings, will be presented.

Health inequity emerges from structural issues. Public health interventions generally widen the health gap which is maintained and enforced by mechanisms on many levels in the societies. Interventions that aim to counteract health inequity need to take this into account and broaden the perspective to include not only life style habits but also discrimination, stigmatization, control, influence and power. Critical reflection is necessary to prevent interventions from consolidating current positions of power and to assure that communities and individuals - can influence goal-setting and measures taken. The Swedish Commission for Equity in Health highlighted the importance of methodological development and knowledge-based efforts including better follow-up, evaluation, research and dialogue. Mediators between measures taken and effects need to be clarified.

Health promotion needs to be evaluated systematically with a focus on how interventions function in relation to the task of closing the gap. However, interventions are often merged into other activities and the impact of a continuously changing society cannot be controlled for. Use of evidence-based methods including influence from participants are fundamental, as is critical reflection. Documented by a digital instrument, measures taken and reflected upon can form a database for continuous summative and formative evaluation, aiming at developing methods for effective public health work.

Added value

Presenting and discussing a digital instrument for planning, documentation and quality assurance will increase the potential for public health efforts to close the health gap. We use it for formative and summative evaluation. For 2018, 222 activity reports were launched and discussed by team members, leading to professional development. Issues for future development included the importance of giving time for shared values to consolidate and trust to emerge. Quantitive goals were reached.

Coherence

Presentation 1 will clarify why control, power and influence must be taken into consideration in interventions that aim at counteracting health inequity.

Presentation 2 will describe the instrument and how it draws on theories of health and critical reflection.

Presentation 3 will tell the story of an example from a Swedish dental public health care setting where the instrument has been used and point at strengths and areas for development.

Format

Presentation 15 minutes each. Followed by short discussions (5 minutes) in the audience who will then be asked to present short inputs on post-it notes that will be collected by the organizers. During the last 30 minutes there will be a general discussion using the post-it notes as starting point.

Key messages:

- A digital instrument for planning, documentation and quality assurance, with focus on health equity, will increase the positive impact of public health efforts.
- Public health interventions that use the instrument will be better equipped to increase health equity.

Ground pillars of a method for quality assurance of public health work

Maria Magnusson

M Magnusson[1,2], M Hallmyr[1], K Wretlind[3]
[1]Public Health Unit, Angered Hospital, Region Västra Götaland, Sweden
[2]School of Health and Education, University of Skövde, Region Västra Götaland, Sweden
[3]Public Dental Service, Region Västra Götaland, University of Malmö, Sweden
Contact: maria.b.magnusson@vgregion.se

Socioeconomic position, expressed in terms like educational level, income, wealth or origin, is a strong predictor of most health outcomes. Sustainable efforts for good and equitable health need to draw on theories that consider power relations as well as scientific methods for health promotion, prevention and /or treatment. Systematic planning and documentation is required. The perspective should include not only life style habits but also issues like discrimination and stigmatization. Control and influence from participants are necessary to assure that goal-setting and measures taken are adequate.

Health inequity emerges from structural issues and is mediated by mechanisms on different levels, mechanisms of which some are difficult to describe and analyze. Regrettably, health care systems, including public health interventions, in many cases reinforce this inequity. Health care staff's personal perspectives and prerequisites (e.g regarding education and income) often differ from the corresponding ones in groups with the less favorable health outcomes. That is one reason why efforts for equitable health need to involve perspectives, prerequisites and health motives of ‘‘targeted’’ individuals and groups as salient parts of interventions, from the planning stage and throughout. A complementary way to prevent intervention procedures from consolidating current positions of power is to allow for professionals to continuously perform critical reflection of their own presuppositions and prejudices in relation to actions and results.

The use of determinants from Social Cognitive Theory (SCT) (self- efficacy, observational learning, facilitating, expectations of outcome, reciprocal determination) enables planning that consider not only individuals and groups but also their social context. Systematic use of strategies from SCT, critical reflection and formative as well as summative evaluations allow for quality assurance and knowledge development.

Health Equilibrium Methodology (HEM), a digital tool in public health work for health equity

Moa Hallmyr

M Hallmyr[1], *K Wretlind*[2], *M Magnusson*[1,3]
[1]Public Health Unit, Angered Hospital, Region Västra Götaland, Sweden
[2]Public Dental Service, Region Västra Götaland, University of Malmö, Sweden
[3]School of Health and Education, University of Skövde, Skövde, Sweden
Contact: moa.hallmyr.lewis@vgregion.se

HEM draws on theories for health behavior and power relations. The methodology contains a structured documentation for formative and summative purposes. Strive for a high level of participation, control and influence from individuals and community members is a foundation pillar. Systematic use of theories allows for answering the fundamental question ‘‘in what way do we anticipate the planned intervention to contribute to closing the health gap?’’ Social Cognitive Theory (SCT) considers social and physical environment. HEM currently involve several SCT determinants in planning and evaluation; self- efficacy, observational learning, facilitating, expectations of outcome, reciprocal determination. The qualitative procedure is described below. Numeric data are also collected.

Step one (before action, e.g. a dialogue-meeting): Consider which determinant(s) may be affected by the planned action, and by what mechanisms.

Step two: Carry out the action.

Step three: Describe what happened, based on input from the participants and the anticipated determinants and mechanisms.

Step four: Systematic self-critical review based on common grounds for discrimination. Examples: Was it difficult to engage or include participants because of language, gender, function variation, national background or other factor? In retrospect, can you identify stereotypes in the examples you used? Did anybody else at the event act to maintain prejudice or exclusion?

Step five: consider implications for methodological development.

Step six: Formative collective evaluation based on reflections from step four and implications from step five.

Stakeholders using HEM gather regularly for workshops based on their HEM-reports, aiming at developing tools for increasing health equity. HEM is implemented in public health work of Angered Hospital and the Dental Public Health, Region Västra Götaland, and is used by 20 different stakeholders. A web-application has been developed to facilitate documentation and spread.

Implementing HEM in the assessment of oral health promotion to families in underserved areas

Katharina Wretlind

K Wretlind[1], *M Magnusson*[2,3], *M Hallmyr*[2]
[1]Public Dental Service, Region Västra Götaland, University of Malmö, Sweden
[2]Public Health Unit, Angered Hospital, SV Hospital Group, Region Västra Götaland, Sweden
[3]School of Health and Education, University of Skövde, Skövde, Sweden
Contact: katharina.wretlind@vgregion.se

The aim was to, in an oral health promoting setting in low socioeconomic areas, implement a method aiming at improving quality of work by assessing both formative and summative results. The overall aim is to decrease health inequity.

Methods:

Five teams of dental hygienists (n = 5) and dental nurses (n = 3), who operated in socioeconomic low-status areas, participated. The teams were performing health promoting activities on arenas as for example family-centrals. These teams were introduced on how to report health promoting activities according to the Health Equilibrium Methodology (HEM), which is based on Social Cognitive Theory. Following questions were put and answered in every report: Which health determinants were targeted? Did any person seem to perceive him-/herself excluded? Did anything unexpected happen? What to think about next time? Quantitative data were also documented: Almost six-hundred individuals were included in a total of 36 reports. Of these 50% were adults/parents and the rest children, most of them between 1-6 years old. The reports were written directly into a database after every activity and then processed by a facilitator and later discussed with the teams in workshops every third month.

Results:

Analysis of the reports shows that the implementation of health promoting activities according to HEM included the following: -Identification of important health determinants. -Attention on how to get everyone involved and if anything unexpected happened. - Suggestions for change for the next time. Throughout the workshops the team-members exchanged experiences.

Conclusions:

The HEM-method facilitates depicting and discussing the process of health promotion with focus on health equity. Thereby the method has a potential to support development of high-quality health-promoting activities in populations with low socioeconomic status. It may also lead to a better professional self-confidence.

7.Q. Workshop: Care4Care: the migrant care workforce in Europe

Organised by: EUPHA (HWR), EUPHA (HSR), EUPHA (PHPP)
Chair persons: Ellen Kuhlmann - EUPHA (HWR), Judith de Jong - EUPHA (HSR)
Contact: kuhlmann.ellen@mh-hannover.de

Background:

Foreign trained health workers increasingly fill the care gaps caused by labour market shortage and governance failures. As doctors, nurses and carers they make a crucial contribution to health system performance and the health of the population. These contributions are likely to increase in future, especially in high-income countries, where demographic change and NCDs reinforce the gap between demand for care and labour market supply. However, health system demands for migrant carers do not sit easily with the new wave of nationalism and populist movements in Europe and globally; they may also reinforce the ‘care drain’ in less well-resourced sending countries. There is an urgent need for more inclusive health workforce governance in order to take ‘care’ for the migrant health workforce both nationally and globally and ensure ‘health for all’.

Objectives:

This workshop addresses these questions and fosters critical debate. It has three major aims: to make the migrant carers visible as important part of the health workforce and health system performance, to unmask the threats of growing nationalism and populist movements to healthcare systems and universal healthcare coverage, and finally to critically discuss how to govern the migrant care workforce in ways that improve both integration in the host country and solidarity across Europe and globally. The workshop brings together knowledge and expertise from the areas of health workforce, health services, and health policies and systems. It is organised as round table discussion, facilitated by an overview of migrant care workforce patterns and policies in selected European Union (EU) high-income countries and two in-depth country cases, namely Italy and Austria, both known for growing populism and nationalism and strong anti-migrant policies in the EU. The three panelists will discuss the role of migrant care workers and explore, from different perspectives, how to build capacity for new forms of health workforce governance that move beyond narrowly defined national/regional interests of health systems. The workshop will foster a wider debate on migrant careers and health workforce needs, and how public health can contribute to better take 'care' for the human resources for health.

Key messages:

- Migrant carers form an important part of the health workforce in European countries.
- Health systems must take care of the migrant health workforce and counteract growing nationalism.

The migrant health workforce in European countries: does anybody care?

Ellen Kuhlmann

E Kuhlmann[1,2], *SL Greer*[3,4], *V Burau*[1,5], *M Falkenbach*[3], *H Jarman*[3], *E Pavolini*[6]

[5]Department of Political Science, Aarhus University, Aarhus, Denmark
[6]University of Maccerata, Maccerata, Italy
Contact: kuhlmann.ellen@mh-hannover.de

Background:

Data and knowledge on the migrant health workforce are poorly developed, and we do not understand which institutional contexts may foster responsible governance. This introduction seeks to set the scene for critical debate by placing the structure and composition of the migrant health workforce in the context of health systems and policy. The aim is to confront growing nationalism and populism with the important contribution of migrant carers to health system performance and the health of the population.

Methods:

A comparative approach was applied and a rapid review of available data and research undertaken. Five EU countries were selected which represent different healthcare systems, health workforce patterns and political contexts in high-income countries, comprising Austria, Denmark, Germany, Italy, UK.

Results:

The migrant workforce pattern show high variation. The number of physicians is highest (around 28%) in the UK, and low in Austria, Denmark and Italy (below 5%) while Germany is in a middle position (around 10%). The picture turns when looking at nurses and carers, where Italy and Germany for instance are placed in higher ranks. The results suggest three things: no coherent patterns of health system types and composition of the migrant care workforce can be identified. There is also no clear connection between the size of the migrant health workforce and the relevance of populist movements. And finally, the migrant carers remain largely absent in the policy debates; none of the health systems has develop a comprehensive governance model that 'cares' for the migrant carers and that could help to highlight their contribution against the threats of growing nationalism and populism.

Conclusions:

There is a need for comprehensive European monitoring and research to develop more inclusive health workforce governance and to identify institutional conditions that improve capacity and capability for 'care' 'of the migrant health workforce.

Italy: nationalist anti-migrant policies and emigration of Italian health professions

Emmanuele Pavolini

E Pavolini[1]
[1]University of Maccerata, Maccerata, Italy
Contact: emmanuele.pavolini@unimc.it

Background:

Traditionally Italy has been characterised by a limited investment in healthcare personnel, apart from physicians. The outcome has been a low health worker to population density; especially nurses and long-term care personnel face shortages. The outcome has been, at least until 2010 an increasing presence of migrant care workers. However, the situation has changed for several reasons. On one hand, since austerity policies have been implemented, the whole healthcare system has registered a freeze in new healthcare personnel hiring. One the other hand, in more recent years policies have started to be implemented, especially by the latest government (where one of the two governing parties is a radical right one) to make it more difficult for migrants to access the country.

Methods:

The study draws on an analysis of administrative data and previous researches in the field, matched by qualitative interviews with key informants at the national level.

Results:

Shortage of skilled workers in the health sector is likely to increase in future. It is becoming more difficult for foreigners to get access to work in this sector, while Italian healthcare workers are leaving the country. In recent years there has been a strong increase in healthcare professionals' emigration toward North America and other EU countries.

Conclusions:

Italy needs both a new effective strategy of health workforce governance and a more migrant-friendly policy to manage incoming and outgoing flows of health professionals.

Austria: target country for care workers despite increased anti-migration policies

Michelle Falkenbach

M Falkenbach[1]
[1]School of Public Health, University of Michigan, Michigan, USA
Contact: michfalk@umich.edu

Background:

Austria is facing workforce shortages in long-term care making the country an important destination for migrant care workers, particularly from Eastern European countries. Many of them are working in low-status positions as carers in 24-hours care, although they are often qualified professionals. These 24-hour care positions are often in private households with no regulated workplace safety or standard minimum salaries. Despite this steady flow of migrant carers, shortage of nurses and carers in the country persists and is likely to increase.

Methods:

A rapid review of available data and research was undertaken.

Results:

The migration of nurses to Austria has played a significant role for many years, as the training of certified nurses within the country has only risen marginally. The annual inflow of foreign trained nurses reached a high in 2016 as did the number of 24-hour care workers, most of which are women. The recent cuts by the government towards family allowances for children not living in Austria will hit this population hard. Current anti-migration policies thus take the risk of reducing the numbers of migrant carers, although the government does not have a plan in place on how to fill the gaps and develop more effective health workforce planning and management.

Conclusions:

Growing nationalism, a government pushing towards stricter migration laws and a restrictionist policy stance of unions relative to migrants, all create new threats to a health system heavily dependent on migrant carers.

Panel: Care4Care: what is it about the migrant care workforce and how to improve inclusion?

Gabrielle Jacob

A round table comprising three panelists will discuss the topic from different perspectives.

- Gabrielle Jacob, WHO: The WHO Global Code of Practice on the International Recruitment of Health Personnel. How far have we come, where are we now and what's next?
- Natasha Azzopardi-Muscat, EUPHA President: The role of public health in raising awareness on the contribution of migrant workers to health systems
- Scott L Greer, European Observatory on Health Systems and Policies: Governance4Care of the migrant care workforce: what matters?

8.A. Women's health

''People expect you to work like you don't have a child but be a mum like you don't have a job'

Lynne Rush

L Rush[1], *S Hilton*[1], *L McDaid*[1]
[1]Social and Public Health Sciences Unit, University of Glasgow, Glasgow, UK
Contact: l.rush.1@research.gla.ac.uk

Background:

Recent UK campaigns that aim to increase awareness of sepsis have been accompanied by high profile media reporting about deaths in children resulting from misdiagnosis. Parents have been urged by the Sepsis Trust to have a low threshold for suspecting sepsis when their child is unwell and to follow 'gut instincts', challenging health professionals if necessary. This study aims to explore how parents enact this advice in the context of everyday life.

Methods:

Thematic analysis of 16 focus groups comprised of parents and carers of pre-school children and 4 groups with individuals affected by sepsis.

Findings:

Participants encountered various barriers and conflicts of interest when endeavouring to do the 'right' thing in managing acute childhood illness. Gaining access to healthcare was often challenging, with parents weighing up the need for reassurance against fears of over using scarce health care resources. Despite knowledge of recent sepsis awareness campaigns, parents frequently reported that the diverse symptoms described were too non-specific to be of practical use. 'Knowing your child' and being able to detect subtle deviations from normal was seen as key to decision-making about the need to escalate care. However, for parents in paid employment, the obligation to be present with their sick child to monitor symptoms closely was often in conflict with their duty to employers. The capacity to work flexibly, while highly valued, was inconsistent and frequently based on discretion of line managers rather than supported by official workplace policies.

Conclusions:

Recent awareness campaigns have highlighted the need for parents to be alert to the possibility of sepsis when their child is acutely unwell. However current campaign materials do not enable parents to confidently identify when to seek help. Lack of access to primary care appointments and unsupportive employment policies may act as barriers to acting in accordance with sepsis awareness messages.

Key messages:

- Recent sepsis awareness campaigns focus on the importance of 'parental instinct' in managing risk.
- Parents often experience conflicting obligations towards their child and employer which can act as a barrier when monitoring risk during episodes of acute illness.

Risk factors associated with repeated voluntary termination of pregnancy in Tuscany, Italy

Margherita Napolitani

M Napolitani[1], *L Kundisova*[1], *A Serafini*[2], *D Lenzi*[2], *G Messina*[1,3], *N Nante*[1,3]
[1]Post Graduate School of Public Health, Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
[2]Hospital Misericordia, Local Health Unit Tuscany South-East, Grosseto, Italy
[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
Contact: napolitani1005@hotmail.it

Introduction:

In Italy, voluntary termination of pregnancy (VTP) was introduced in 1978 with law n°194, it guarantees autonomy of choice and avoids the practice of unsafe abortions, health complications and death. The aim of this work was to analyse variables associated with repeated VTP.

Methods:

A cross-sectional study was realized, with data relative to VTP acquired in the period 2016-2018 in Tuscany South-East area (Italy). Data on age, nationality, civil state, education level and n° of living children were extracted from the information system in April 2019. A descriptive analysis was conducted using Stata.

Results:

The sample consisted of 3451 females (65% Italian). The average age was 31.1±7.3 years. The majority of females (53%) had medium-high education level (non-Italian females had more frequently low education level: 48% vs. 28%, chi-2; $p<0.001$). The 57% were unmarried, mostly Italian (64% vs. 43%). The majority (62%) already had child (26% one, 36% two or more). Females with repeated VTP represented 25% and were significantly older (32.1 ±6.4 vs. 30.7±7.6; $p<0.001$). The non-Italian females (OR = 2.15; 95%CI 1.8-2.6; $p<0.001$) and females that already have children (OR = 2.4; 95%CI 2.02-2.9; $p<0.001$) had higher probability of having a VTP in the past. The multivariate analysis showed lower probability of repeated VTP for married women (OR = 0.49; 95%CI 0.42-0.64) and women with higher education level in confrontation to those with an elementary education (OR = 0.3; 95%CI 0.18-0.62). The variables associated with higher probability of VTP were age (OR = 1.02; 95%CI 1.01-1.04), nationality (OR = 2.0; 95%CI 1.7-2.4) and children (OR = 2.4; 95%CI 1.9-3).

Conclusions:

Females with repeated VTP were older, have already children and were more frequently of non-Italian nationality. The reduction of VTP should be one of major objectives of public health as in has negative consequences on women's health. The targeted public health intervention could be a solution of this situation.

Key messages:

- Females with multiple VTP were older, already had children and were more frequently of non-Italian nationality.
- Targeted public health interventions could be effective in reducing the number of VTP.

Nation-wide profile of women using hormonal contraception in Finland in 2017

Elena Toffol

E Toffol[1,4]*, A But*[1]*, O Heikinheimo*[2]*, A Latvala*[1,3]*, T Partonen*[4]*, J Haukka*[1]

[1]University of Helsinki, Helsinki, Finland
[2]University of Helsinki and Helsinki University Hospital, Helsinki, Finland
[3]Institute for Molecular Medicine Finland, Helsinki, Finland
[4]National Institute for Health and Welfare, Helsinki, Finland
Contact: elena.toffol@helsinki.fi

Background:

Up to 69% of European women use contraception. Nordic countries have traditionally high levels of contraception use, of welfare and social equality. However, the uneven population distribution across the Finnish territory makes the easiness of access to health care structures and trained professionals an important issue in relation to effective contraception use. Understanding the patterns of contraception prescription and their underlying determinants is crucial to guarantee the best contraceptive option for each woman.

Methods:

In Finland, users of hormonal contraception (HC) can be identified from register records only starting from 2017. This nationwide, register-based study includes all women with at least one HC prescription in 2017, and a reference cohort of non-users, matched by age and municipality. Through linkages to Finnish National Registers we retrieved sociodemographic data. We calculated national and regional rates and distributions, and compared distributions with t-test, Kruskal Wallis or Chi-squared test.

Results:

The HC cohort included 294445 women aged 15-49 years (mean 28.9, SD 8.6), 25.8% of Finnish women of that age range. The majority of them were unmarried (71.8%) and employed (71.6%). Compared to non-users, HC users were more often unmarried, a cohabiting couple without common children, employed, had upper secondary or bachelor level education, and higher annual income ($p < 0.001$). Differences between HC users and non-users were non-homogenous across 70 Finnish regions.

Conclusions:

These preliminary results show different sociodemographic correlates of HC use across Finnish regions. Our findings will guide public health strategies aimed at guaranteeing the best contraceptive option for each woman across the whole country.

Key messages:

- Sociodemographic correlates of HC use differ across Finnish regions.
- These differences may reflect differences in access to health care services, in prescribers' characteristics and in HC methods.

Reproductive and contraceptive healthcare for vulnerable people in the Netherlands: Pregnant not now!

Connie Rijlaarsdam

CW Rijlaarsdam[1]*, DWM van Sambeek*[1]*, L Rust*[1]

[1]GGD GHOR Nederland, Utrecht, Netherlands
Contact: crijlaarsdam@ggdghor.nl

Issue/problem:

Unplanned and unwanted pregnancies are an important issue in public health. Especially when parents already are in complex or vulnerable situations, for example being homeless, having an addiction, serious psychiatric- or financial problems or intellectual disabilities. Although most of these parents are in contact with several professionals, family planning and contraceptives are rarely discussed.

Description of the problem:

In 2014 a pilot programme was developed to support vulnerable adults on family planning and adequate use of contraception. In a qualitative explorative case study the pilot was evaluated.

Results:

The pilot showed a significant increase in postponed pregnancies by using appropriate contraceptives. Over eighty percent of this population started contraception on a voluntary basis. The study showed 5 determinants influencing contraception use: responsibility, knowledge, finance, emotion and social environment. If needed, the programme played a role on all different determinants. The method of working was the key element in the success: addressing family planning and contraceptive use through an outreach practise orientated presence approach and empowerment. Another important factor for success was the collaboration between public health and medical doctors.

Lessons:

The successful pilot became regular care for vulnerable (potential) parents in Tilburg. The pilot was replicated in two other cities, Rotterdam and Nijmegen, with similar results. In 2018-2021 the programme will be implemented nationwide with financial support of the Ministry of Health, Welfare and Sports, coordinated by GGD GHOR Nederland (the Association of GGDs (Regional Public Health Services) and GHOR-(Regional Medical Emergency Preparedness and Planning) offices in the Netherlands).

Key messages:

- 'Pregnant not now!' successfully supports vulnerable people with family planning and contraceptives, helping them to gain control over their future and preventing unplanned and unwanted pregnancies.
- The programme is unique and preventive, its innovative character is applicable in other communities in the Netherlands and possibly across Europe.

Health situation and health care of women aged 50 years and older in rural regions in Germany

Franziska Prütz

F Prütz[1]*, L Krause*[1]*, E Nowossadeck*[1]*, M Thißen*[1]*, L Dini*[2]

[1]Department of Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
[2]Institute of General Practice, Charité - Universitätsmedizin Berlin, Berlin, Germany
Contact: PruetzF@rki.de

Background:

In many countries demographic changes and regional differences lead to inequalities in healthcare provision. In Germany, this applies especially to rural regions and could affect the healthcare situation of middle-aged and older women in particular. Our study, which is part of the project "Frauen 5.0", explores the health and healthcare situation of women 50 years and older in Northeastern Germany, with focus on outpatient gynaecological and general medical care and reasons for healthcare utilisation.

Methods:

Our analyses comprise the health situation of women aged 50 years and older, their utilisation of outpatient gynaecologists and general practitioners (GPs), reasons for utilisation, access barriers to outpatient care, the demographic situation and the spatial distribution of gynaecological and GP practices in Northeastern Germany. We use a variety of data sources; main data source is the German Health Interview and Examination

Survey for Adults (DEGS1, 2008-2011), which was carried out by the Robert Koch Institute and is representative of the German adult population.

Results:

There is an unequal distribution of gynaecologic and GP practices in Northeastern Germany, with the highest density in and around Berlin. About 30% of gynaecologists and GPs in the study region are aged 60 years and older. Whereas in all age groups at least 80% of women used GP services in the last 12 months, the use of gynaecologic services declines from 80% in 18- to 29 year-old to 45% in 70- to 79 year-old women. Most important reasons for seeking gynaecological treatment are menopause and early detection of cancer.

Conclusions:

The analyses show that there is need to ensure adequate health care for women aged 50 and over in rural regions in Germany. Based on the results, within the project ''Frauen 5.0'' innovative solutions for this task, e.g. interprofessional cooperation, will be identified.

Key messages:

- Analyses of outpatient healthcare services show an unequal distribution of gynaecologic and GP practices in Northeastern Germany; about 30% of the gynaecologists and GPs are aged 60 years and older.
- Whereas in all age groups at least 80% of women used GP services in the last 12 months, the use of gynaecologic services declines from 80% in 18- to 29 year-old to 45% in 70- to 79 year-old women.

Health service provision for women 50+: the ''Frauen 5.0'' project in the north-east region in Germany

Lorena Dini

L Dini[1], *F Pruetz*[2]
[1]Institut of General Practice, Charité Univesitätsmedizin Berlin, Berlin, Germany
[2]Epidemiology and Health Monitoring, Robert Koch-Institut, Berlin, Germany
Contact: lorena.dini@charite.de

Background:

A higher life expectancy for women in Germany coincides with shortages in health professionals. Besides gynecologists (Gyn), the main providers of ambulatory healthcare services for women 50+ are general practitioners (GPs), which are not providing any gynecological services. The project ''Frauen 5.0'' aims to identify strategies for improving health care provision for women 50+ in three north-east states of Germany by analyzing health system indicators and exploring the perspective of service providers, users, practitioners and policy makers.

Methods:

Mixed-methods combined with participatory research including 1) secondary data analysis (Robert Koch-Institute and Zentralinstitut); 2) postal quantitative survey of all Gyn (n = 1.031) and of a randomized sample of 66% of GPs (n = 3.514); 3) qualitative interviews of women 50 + (n = 25); and 4) round tables with practitioners and policy makers.

Results:

In Germany 25% of the population are women 50+, from which 41% do not use Gyn services. Users expressed the need that GPs/Gyn actively address women's health issues during consultation. The survey (response rate 51% Gyn; 25% GPs) revealed a high willingness to collaborate among GPs and Gyn. Barriers and synergies in organizational, professional and user aspects were identified. Task-sharing between GP and Gyn, delegation to non-medical personnel and the introduction of financial incentives showed to be a key element to improve health care services for women 50+.

Dissusion:

In the SDG era of ''leaving no one behind'' acknowledging and addressing the unmet needs of women 50+ is from a public health perspective an issue of utmost urgency as is closing the gap between research, policy and practice.

Conclusions:

New strategies to improve health care services for women 50+ were developed by integrating the evidence from actual data in meaningfull dialogues between research, policy and practice.

Key messages:

- New models of health care provision are required to adress and improve the health of women 50+.
- Closer collaboration between research policy and practice can be achieved by participatory methods.

Mothers' Oral Health Literacy and children's oral health: study in the department of Pikine, Senegal

Serigne Name Dieng

S Dieng[1], *P Lombrail*[1], *D Cissé*[3], *S Azogui-Levy*[1,2]
[1]Santé Publique, Laboratoire Education et de Pratiques en Santé (LEPS), Bobigny CEDEX, France
[2]Santé Publique, UFR d'odontologie – Université Paris Diderot, Paris, France
[3]Santé Publique, Département d'Odontologie – Université Cheikh Anta Diop, Dakar, Senegal
Contact: serigneddas@gmail.com

Background:

Several studies have shown that social conditions in which children are raised and family psychosocial factors affect their oral health. Oral health literacy (OHL) has been shown to be associated with prevalence of dental caries, access to care and prevention of oral diseases. No studies have addressed this issue in Senegal.

Objective: To study the characteristics of the mothers' OHL and its association with children's dental health.

Methods:

Cross- sectional study in the district of Pikine, a suburb of Dakar including 16 municipalities. Two-stage cluster sampling and a sample comprising 315 children from 3 to 9 years old and their mothers. Data on oral health status were collected from clinical examinations, sociodemographic and OHL (Sistani et al' OHL-AQ) data were collected during face-to-face interview.

Results:

More than half of the mothers (56.5%) had a low OHL, but 68.9% had an adequate score for the communication/interactive dimension. The level of OHL increased significantly with education level, household wealth and dynamism of the social support. Prevalence of dental caries was 64.8%, following a social gradient and significantly associated with the mothers' OHL level (OR = 5.2) CI[2.2-14.1]. The oral health behaviour of families was significantly associated with the level of OHL and children's dental health. A structural equation model showed the OHL was a mediating factor between social characteristics and oral health behaviours.

Conclusions:

The OHL of mothers is an important variable to be included in the study of social inequalities in oral health. The communication/interactive dimension seems to be decisive in the African context of an oral culture and dynamic social support which makes it possible to provide better knowledge and preventive behaviour.

Key messages:

- High maternal OHL should be reinforced to lessen oral health inequalities among Senegalese children.
- The communication/interactive dimension seems to be decisive in the African context of an oral culture and dynamic social to enhance OHL.

8.B. Welcoming refugees: from monitoring to practice

Surveillance of health and primary care of asylum seekers in reception centers: concept and results

Rosa Jahn

R Jahn[1], *K Bozorgmehr*[1,2]
[1]Department of General Practice and Health Services Research, UniversitätsKlinikum Heidelberg, Heidelberg, Germany
[2]Faculty of Health Sciences, Universität Bielefeld, Bielefeld, Germany
Contact: rosa.jahn@outlook.com

Background:

Reliable data on health and primary care among asylum seekers in reception centers are essential for the planning and provision of medical services, but haphazard care provision and lack of standards for health information systems in these centers preclude routine health monitoring. We aimed to establish a routine surveillance system in reception centers for asylum seekers in Germany, generating multi-center data on key health indicators.

Methods:

To enable routine health surveillance, we established an electronic medical records system (RefCare©), a research network, and an IT-infrastructure for the automated analysis of health data in German reception centers. Within the network, 64 health and health care indicators on morbidity, care processes, quality of care and syndromic surveillance were identified. In November 2018, we analyzed 33 indicators using routine health data from nine centers in three federal states. We calculated single-center prevalence and pooled estimates for selected morbidity indicators stratified by age and sex, and process and quality indicators stratified by center.

Results:

A total of 8,406 patients and 39,449 patient contacts were analyzed, with mean utilization of health services ranging from 2.33 (Standard deviation, SD: 2.0) to 11.49 (SD: 22.82). The morbidities with the highest prevalence were respiratory, digestive and certain infectious diseases, followed by consequences of external causes, musculoskeletal and mental health conditions. Irrational use of antibiotics was below the threshold for primary care settings.

Conclusions:

For the first time in Germany, a harmonized infrastructure for the automated, anonymized surveillance of the health and health care of asylum seekers in reception centers was established in several federal states. The analysis of morbidity indicators shows a primary care-typical disease profile, with special needs regarding mental health and consequences of external causes, such as physical trauma.

Key messages:

- Routine health surveillance of asylum seekers in reception centers can be achieved through an innovative harmonized, cross-regional, multi-center, anonymous and automated surveillance system.
- Health issues of asylum seekers in reception centers in Germany mainly consist of primary care conditions with special vulnerabilities regarding mental health and consequences of external causes.

The health of asylum seekers in Finland: a total population health examination survey (TERTTU)

Natalia Skogberg

N Skogberg[1], *P Koponen*[2], *E Lilja*[1], *K-L Mustonen*[1], *F Garoff*[1], *A Ahmed*[1], *AE Castaneda*[1]
[1]Equality and Inclusion, National Institute for Health and Welfare, Helsinki, Finland
[2]Public Health Solutions, National Institute for Health and Welfare, Helsinki, Finland
Contact: natalia.skogberg@thl.fi

Background:

There is scarcity of representative population-based data on the health and wellbeing of asylum seekers in Europe. The Asylum Seekers Health and Wellbeing Survey (TERTTU) was launched to provide the evidence-base for developing services for asylum seekers as well as for planning and allocation of healthcare resources at a national level.

Methods:

A sample of all first-time asylum applicants between 19.2-30.11.2018 was drawn from the Finnish Immigration Services electronic asylum database. Altogether 784 adults aged 18 years and older took part in the standardised health examination and face-to-face interview with participation rate of 79%. Interviewed health measures included the Minimum European Health Module, conditions previously diagnosed by a physician, permanent injury due to violence or accident and somatization.

Results:

Self-rated health was good among 66% (95% CI 62,5-69,1) and 42% (95% CI 38,5-45,4) reported having some self-reported long-term illness or health problem. The most common previously diagnosed conditions were diseases of the circulatory system (19%, 95% CI 16,5-22,0), musculoskeletal system (18%, 95% CI 15,6-21,1), mental and behavioural disorders (13%, 95% CI 10,9-15,6) and diseases of the respiratory system (10%, 95% CI 8,0-12,2). Nearly half (47%, 95% CI 43,7-50,8) reported having a permanent injury due to violence or accident. Somatisation was common: 23% (95% CI 20,3-26,2) reported having headache, 23% (95% CI 19,9-25,8) back ache and 13% (95% CI 10,8-15,6) other pains at least several times a week.

Conclusions:

The overall health of newly-arrived asylum seekers was poorer compared with the general Finnish population and migrant origin populations from similar countries of origin permanently living in Finland. Significant differences in asylum seekers health were found by sex and region of origin. Survey data will be used for developing the national initial health assessment protocol for asylum seekers during 2019.

Key messages:

- The TERTTU Survey is the largest population-based health examination survey among newly-arrived asylum seekers in Europe to date.
- The extensive data gathered over the course of the survey will be used for developing services for asylum seekers at a national level and is of high relevance also to other European countries.

Health monitoring among refugees: a state-wide, cross-sectional, population-based study in Germany

Louise Biddle

L Biddle[1], *N Menold*[2], *M Bentner*[1], *S Nöst*[1], *R Jahn*[1], *S Ziegler*[1], *K Bozorgmehr*[1,3]
[1]Working Group on Social Determinants, Equity and Migration, University Hospital Heidelberg, Heidelberg, Germany
[2]Methods in Empirical Social Research, Technical University Dresden, Dresden, Germany
[3]Working Group on Population Medicine and Health Services Research, University Bielefeld, Bielefeld, Germany
Contact: louise.biddle@med.uni-heidelberg.de

Background:

Health monitoring in Germany falls short on generating timely, reliable and representative data among migrants, especially transient groups such as asylum seekers and refugees (ASR). We aim to advance health monitoring approaches and obtain reliable estimates on health status and access to health services among ASR in Germany's 3rd largest federal state.

Methods:
We conducted a state-wide, cross-sectional, population-based health monitoring survey in nine languages among ASR in collective accommodation centres. Questionnaire items capturing health status, access to care and sociodemographic variables were taken from established surveys and translated using a team approach. Random sampling on the level of 1,938 accommodation centres was employed to draw a balanced sample. Multilingual field teams recruited eligible participants using a "door-to-door" approach.

Results:
Fieldwork was conducted in 58 centres, obtaining a response rate of 42.2% (n = 412). Age, sex and nationality of the included sample were comparable to the population of asylum applicants in Germany. Adults reported longstanding limitations (16%), bad/very bad general health (19%), pain (25%), chronic illness (40%), and depressive (46%) and anxiety symptoms (45%). 52% utilised primary and 37% specialist care services in the previous 12 months, while reporting unmet needs for primary (31%) and specialist care (32%). Younger and male participants had above-average health status and below-average utilisation, in contrast to older and female ASR.

Conclusions:
Our health monitoring survey yielded reliable estimates on health status and health care access among ASR, revealing relevant morbidities and patterns of care. Applying rigorous epidemiological methods in linguistically diverse, transient and marginalized populations is challenging, but feasible. Integration of this approach into state- and nation-wide health monitoring strategies is needed to sustain this approach as a health planning tool.

Key messages:
- Applying rigorous epidemiological methods in linguistically diverse, transient and marginalized populations is challenging, but feasible.
- Sustainable integration of multi-lingual epidemiological methods is required in state- and nation-wide health monitoring to capture health status and access to health services for ASR.

Treatment gap and mental health service use among Syrian refugees in Turkey

Daniela Fuhr

DC Fuhr[1], C Ataturk[1], M McGrath[2], Z Ilkkursun[2], A Woodward[3], E Sondorp[3], B Roberts[1]
[1]Public Health and Policy, LSHTM, London, UK
[2]Department of Psychology, Istanbul Sehir University, Istanbul, Turkey
[3]KIT, Royal Tropical Institute, Amsterdam, Netherlands
Contact: daniela.fuhr@lshtm.ac.uk

Introduction:
Turkey hosts the highest number of Syrian refugees in Europe. Refugees are often vulnerable to situational forms of psychosocial distress as a consequence of exposure to war and violence which may result in more profound mental health problems if no treatment is sought. The aim of this study is to report evidence on mental health and psychosocial support (MHPSS) needs, access and barriers to MHPSS care among Syrians refugees living in Istanbul, Turkey.

Methods:
A cross-sectional survey was conducted among Syrian refugees aged 18 years or over in Istanbul (Sultanbeyli) between February and May 2018. Data among 1'678 Syrian refugees were collected on mental health outcomes using the Posttraumatic Stress Disorder (PTSD) Checklist (PCL-5) and the Hopkins Symptoms Checklist (HSCL-25) for depression and anxiety. We also collected data on health care utilization, barriers to seeking and continuing care as well as knowledge and attitudes towards mental health. Descriptive analyses were used.

Results:
The prevalence of PTSD, depression and anxiety was 19.6%, 34.7% and 36.1% respectively. The treatment gap was 89% for PTSD, 90% for anxiety and 88% for depression. 249 respondents (15%) screened positive for either PTSD, depression or anxiety in our survey and self-reported emotional/behavioural problems since arriving in Sultanbeyli. Several structural and attitudinal barriers for not seeking care were reported.

Conclusions:
To overcome the treatment gap, mental health care programmes need to be more responsive to the needs of Syrian refugees. Barriers to seeking and continuing care can be overcome by providing MHPSS services in the community which facilitate access to care. Community-based programmes of care should be supported by activities which increase awareness about mental health issues and tackle negative attitudes towards mental illness.

Key messages:
- This study provides the first nationally representative data on the mental health of Syrian refugees in Turkey, and shows that refugees have high mental health needs.
- Syrian refugees do not seek mental health care despite availability of mental health services in the community.

Participatory practice with queer refugees in Germany

Tanja Gangarova

T Gangarova[1]
[1]Structural Prevention, Deutsche AIDS-Hilfe e.V. (DAH), Berlin, Germany
Contact: tanja.gangarova@dah.aidshilfe.de

Evidence shows that queer refugees in Germany neither have equal access to the health system, information, HIV-Testing and treatment, nor are they involved in HIV-Prevention. The community-based participatory health approach provides a valuable tool for building capacity and enabling queer refugees to create knowledge and develop appropriate prevention tools for their communities.

"Your health, your rights" (2017-2018) is a 2-year community-based participatory health project, which aims to improve the involvement of queer refugees in HIV-Prevention, as well as to create appropriate prevention media in collaborative way. It is conducted by the National AIDS Organization in collaboration with partners from different immigrant organisations, queer refugees and AIDS service organisations - all based in Berlin.

The components of the project include a multilingual participatory need assessment workshop, a series of capacity-building methodological workshops, a community-led art-based project and a participatory evaluation.

12 queer refuges choose to take part in the project and have been supported to document their lived experiences using community and concept mapping. Key topics and needs connected to sexual health have been jointly identified. Based on these results and in the framework of an art-based workshop participants created a design of multilingual website for queer refugees which delivers helpful information in appropriate way (www.queerrefugeeswelcome.de).

The involvement of queer refugees in HIV-Prevention is possible, if it is enabled. The usage of participatory visual methods has opened up ways of participation of even highly traumatised refugees who otherwise are not able to verbally express their thoughts and enabled the communication between participants who don't share the same language.

Key messages:
- The resources of queer refugees are identified and mobilised and community building processes are supported. The participants improved their competencies (empowerment).
- Service providers are able to tailor their services better to the needs of queer refugees.

8.C. Digital technologies: future in care

Establishment of Centre of competence ''Leonardo Da Vinci'' in Medical University of Pleven, Bulgaria

Silviya Yankulovska

S Yankulovska[1]*, Sl Tomov*[2]
[1]Faculty of Public Health, MU-Pleven, Pleven, Bulgaria
[2]Faculty of Health Care, MU-Pleven, Pleven, Bulgaria
Contact: silviya_aleksandrova@hotmail.com

Issue/problem:

In 2016 Ministry of education and science initiated a call for projects for establishment of centres of competence aiming to increase the level and market orientation of the research activities in Bulgaria and to support the development of innovation capacity. The center of competence on personalised medicine, 3D and telemedicine, robotic and minimally invasive surgery in Medical University of Pleven is to be developed from 2018 to 2023.

Description of the problem:

The objectives are: 1) To create a high-tech research and educational product with long-lasting tendencies to improve the community's scientific development and level of public health; 2) To set up research teams of young researchers to write modern PhD theses and publications in high impact scientific journals; 3) Ð¢Ð¾ integrate research results into the business.

Methods:

classical and virtual microscopy, computer-assisted morphometry, clinical-genealogical method, functional endoscopic sinus surgery, laparoscopic transanal total mesorectal excision, hysteroscopic morcellation and others.

Results:

About 2500 patients will be treated in the centre for 5 years. Diagnostic panels will be developed for different cancer types and the most common hereditary diseases within Bulgarian population. Individual orthotics suitable for 3D printing will be developed and patented. Tissue transplants will be created for body models that will be used for training on robotic surgical simulator. The telemedicine center will allow distant consultations with other centers, specialized training and research in virtual reality. The teams are experienced in the genetic testing and robotic surgery. Till 2015 all robotic surgeries in Bulgaria were performed in Pleven. The proportion for 2016, 2017 and 2018 was respectively 81.1%, 71.5% and 32% due to the increase of number of robotic surgery centres. Pleven's centre has strong training traditions to guarantee the high quality of planned 72 workshops and seminars.

Key messages:

- The introduction of new technologies requires new models of training of health professionals to develop the necessary skills to take full advantage of their benefits.
- Better dissemination of innovations increases the access of population to health care of good quality and the achievement of highest attainable standard of physical health.

Final Products: a regional integrated output assessment in Public Health services, 2017-19 Italy

Cecilia Smaniotto

C Smaniotto[1]*, F Del Bianco*[2]*, E Giardinelli*[2]*, G Bravo*[1]*, C Oppi*[3]*, C Campanale*[3]*, L Cinquini*[3]*, S Brusaferro*[1,4]
[1]Department of Medicine, University of Udine, Udine, Italy
[2]West Friuli Hospital, Pordenone, Italy
[3]Institute of Management, Scuola Superiore Sant'Anna, Pisa, Italy
[4]Udine Healthcare and University Integrated Trust, Udine, Italy
Contact: smaniotto.cecilia@spes.uniud.it

Issue/problem:

The classification of Public Health services (PHS) and related healthcare information systems (HIS) in Friuli Venezia Giulia, Italy, are complex and non-homogeneous. Since 2017 the Region has been realigning HIS according to the new Final Products (FP) System to classify PHS. The aim is to implement an integrated FP-based HIS, easing data transmission and improving the quality of planning, scheduling and expense reporting activities.

Description of the problem:

From June 2017 to October 2018 68 Public Health professionals (PHP) from 10 Public Health areas outlined 102 PF from HIS through flowcharts and technical dossiers. Afterwards (10/5th-10/29th 2018) they assessed HIS through a questionnaire of 24 items. Statistical analysis was performed with Fisher's Exact Test, stratifying 4 categories (physician, veterinarian, prevention technician, other professional). In June-July 2019, through a matrix-based assessment, PHP of regional PHS were invited to weight each FP activity on the basis of involved personnel and possible required transfer (valorisation phase).

Results:

The questionnaire got 45/68 responses (66%). Among responders, 27% reported a HIS for their PHS not being available at all; 65% of responders agreed on the usefulness of an integrated regional HIS for PHS. Fisher's Test showed significant differences in HIS features according to profession, as interoperability with national/regional databases ($p = 0.0144$), mobile usability for external activities ($p = 0.0302$), real correspondence between monitored data and performed activities ($p = 0.0215$). Valorisation was performed by 445/557 PHP (80%).

Lessons:

PHS currently often deal with functional flaws or inappropriateness of HIS when compared to real activities. Valorisation data will be submitted to the attention of policymakers in October 2019 in order to apply an integrated classification of PHS considering both effectiveness and generation of value of activities performed in Public Health.

Key messages:

- Healthcare is a multilayered product and measuring healthcare outputs requires managerial skills and tools, to assess need of resources and to plan activities.
- The regional Final Products project defines a uniform classification of Public Health services and implements a standardised accounting system for activities performed in Public Health.

European network staff eXchange for integrAting precision health in the health Care sysTems'' project

Marco Mariani

M Mariani[1,3]*, R Pastorino*[1,3]*, W Ricciardi*[1,2,3]*, S Boccia*[1,2,3]
[1]Sezione di Igiene, Università Cattolica del Sacro Cuore, Istituto di Sanità Pubblica, Rome, Italy
[2]UOC Igiene Ospedaliera, Fondazione Policlinico Universitario A. Gemelli IRCCS, Rome, Italy
[3]On behalf of the ExACT consortium, Italy
Contact: marcomariani1990@hotmail.it

Background:

Precision health aims to prevent and predict illness, maintaining health and quality of life for as long as possible, by drawing on the new technological and data science tools to translate volumes of research and clinical data into information that citizens, patients and doctors can use.

Objective:

The ExACT consortium, funded by the Marie Curie Research and Innovation Staff Exchange (RISE) 2017 - Horizon 2020, is aimed at building a community of academic and non-academic institutions that generates high quality, multi-disciplinary collaboration by exchanging knowledge in research and training activities on precision health.

Results:
From 2019 to 2023, 74 secondments are foreseen; staff involved will be trained on precision health research topics unavailable at their home institutions. The research topics include 5 domains: Integration of Big Data and digital solutions into healthcare systems; design and promotion of innovative citizen engagement models; education of healthcare professionals and leadership; HTA in precision health; Ethical-legal, social, organisational and policy issues surrounding precision health.

Conclusions:
Secondees will produce key reports, policy recommendations, scientific papers, and informative materials for citizens, fostering public-private interplay and fostering integration of precision health in the EU health systems, contributing to better health for EU citizens.

Key messages:

- Once the secondees are back in their home institution, they will use competences acquired during the secondment to advance the research, and transfer the knowledge to the home organization.
- Sharing knowledge,building synergies and expertise and encouraging best practices,among top-level institutions,will stimulate translational effort for implementing precision health in EU health system.

International, inter-university transferability of a student health surveillance system (SuSy) tool

Ralf Reintjes

R Reintjes[1], M Holt[2], A Kalbus[1], S Powell[2]
[1]Faculty Life Sciences, Department Health Sciences, Hamburg University of Applied Sciences, Hamburg, Germany
[2]Manchester Metropolitan University, Manchester, UK
Contact: Ralf.Reintjes@haw-hamburg.de

Introduction:
While university students are known to face major life transition challenges with the risk to engage in potentially undesirable health-related habits, there are very few attempts to monitor students' health behaviour on a regular long-term basis. Even in cross-sectional designs, students from the field of Public Health and/or Health Sciences are rarely investigated. Here, a cross-university students' health behaviour surveillance system is presented.

Methods:
A students' health and health behaviour surveillance system (SuSy) has been implemented in Hamburg University of Applied Sciences in 2014, collecting and analysing data of health sciences students twice a year since. After Manchester Metropolitan University joined the project and adapted SuSy to its specific context in 2016, data of both SuSy settings were compared using logistic regression models. In addition, focus groups were carried out in both universities in order to assess the perception and acceptance of the tool.

Results:
After eight elicitations with total sample of 1366 responses, a decreasing trend of smoking and increasing trend of cannabis consumption can be observed among Hamburg students. In comparison, Manchester students tend to smoke significantly more (OR = 3.74, 95%CI 1.95-7.17), but consume less cannabis (OR = 0.51, 95%CI 0.14-0.9). Trends in physical activity and healthy food consumption complete the overview. Focus groups revealed that SuSy is perceived as an appealing, useful and recognisable tool among students from both universities.

Discussion:
While being easily adapted in content and delivery, SuSy allows for the provision helpful, comparable information about students' health behaviours as well as for the observation of time trends. These findings underline SuSy's potential in promoting university students' health.

Key messages:

- The student health surveillance system (SuSy) tool allows comparable information about students' health behaviours as well as the observation of time trends.
- SuSy is perceived as an appealing, useful and recognisable tool among students from both universities.

Medical records completeness: can Link Professionals improve quality in a Rehabilitation Hospital?

Enrico Scarpis

E Scarpis[1], M Poletto[1], I Guardini[2], O Dal Bo[2], MR Maestra[2], GP Tea[2], A Zampa[2], L Lattuada[2], L Castriotta[2], S Brusaferro[1,2]
[1]Department of Medicine, University of Udine, Udine, Italy
[2]Udine Healthcare and University Integrated Trust, Udine, Italy
Contact: scarpis.enrico@gmail.com

Background:
The completeness of Medical Record (MR) is an indicator of the quality of care provided. IMFR (Medical and Physical Rehabilitation Institute), a hospital part of the Udine Healthcare Trust with 400 discharges yearly, launched at the end of 2017 a MR-quality program based on the involvement of Link Professionals (LP): doctors, nurses and therapists specifically trained. The main aim of this study is to determine if involving LP would improve MR completeness and would keep it over time. The second aim is to describe the 1-year experience of MR completeness and professional attitude toward recording medical information in it.

Methods:
In December 2017 a new MR was introduced at the IMFR and its completeness was evaluated in January 2018. From January to April 2018, 17 LP educated all colleagues on the recording behavior through periodic meetings and focus groups. Then, LP peer-reviewed 20 inpatients paper-based MRs, assessing completeness, in April 2018 and then quarterly until January 2019. The evaluation was performed with a tool including a total of 73 items, divided in pertinence to the three professional figures involved. Feedbacks on MR completeness were given to professionals by LP in two-weeks. External data validation was performed to ensure data consistency. Significance ($p < 0.01$) was assessed by Cochran-Armitage test for trends.

Results:
The overall completeness of MR improved significantly from 59.6% (552 items out of 926; Jan-18) to 77.0% (738/959; Apr-18), settling to 78.3% (696/889) in January-19, with an overall trend of + 18.7%. Items pertaining to doctors improved significantly from 56.4% (217/385) to 81.4% (1173/1441), nurses' from 60.7% (165/272) to 78.6% (740/941), therapists' from 79.0% (79/100) to 91.7% (277/302). External validation results in 75% of agreement.

Conclusions:
The involvement of LP proved effectiveness in encouraging professionals behavior, supporting the MR completeness improvement and keep it over one year time.

Key messages:

- Professionals involvement and short-term feedbacks contribute to the healthcare quality improvement.
- Peer-reviewing medical records improves professionals attitude in recording behavior.

Educational requirements for Health Information Systems: A scope review of the literature

André Beja

A Beja[1], P Nogueira[2], LV Lapão[1]
[1]GHTM, IHMT-UNL, Lisbon, Portugal
[2]DGS, UM-UL, Lisbon, Portugal
Contact: andre.beja@ihmt.unl.pt

Background:
Sound and reliable information is fundamental to decision-making across all health system. New information technologies can contribute to a more accurate and efficient public health action, requiring new and more sophisticated skills to support this change. Considering the European context, where public health professionals vary by country and cover different areas, and the need for a skilled workforce, the objective of this study is to identify the basic educational components required for a public health information specialist. This study is part of the ongoing research under INFACT Joint Action.

Methods:

A scope review (Pubmed/Ebsco, free access texts, no time restrictions) was carried out in order to answer the following question: Considering the set of activities of public health, what are the main topics and trends of the literature on both Human Resources and Health Information Systems (HIS) training? Abstracts were read by two reviewers and the select texts analyzed using HOT-FIT framework for HIS.

Results:

Among the 53 records, it was possible to identify different study designs and elements related to different contexts and HIS. There is a trend for new publications, with a significant increase since 2014. The content analysis showed more frequent themes in three main categories - Human, Organization and Technology, allowing identifying a wide range of public health professionals and their educational needs.

Conclusions:

Results reinforce the link between information systems and public health, showing the importance of regular HIS as data source for monitoring population health, specific events and determinants, management and research activities and during the stages of the planning cycle of public health activities. The proper workforce capacitation emerges as a success factor for HIS implementation, as well as several professional profiles that carry out public health activities and the areas where it is necessary to strengthen their training.

Key messages:

- There's growing interest in the use of technologies for the development of public health information systems.
- Workforce needs to develop specific skills for the technological challenges in Public Health.

Using technology and cross-cultural teams to deliver trauma-informed medication management

Thomas Buckley

T Buckley[1]*, T Kuoch*[2]*, M Scully*[2]
[1]Pharmacy Practice, University of Connecticut, Storrs, CT, USA
[2]Khmer Health Advocates, West Hartford, CT, USA
Contact: thomas.e.buckley@uconn.edu

Issue/Problem:

Cambodian Americans have high rates of mental health conditions, diabetes and cardiovascular disease. Unique risk factors include history of malnutrition, torture, social isolation, and poor social determinants of health. Community CARES is a trauma-informed model applicable to any trauma community with complex chronic health and mental health problems.

Description of the problem:

High-touch, high-tech approaches can improve access to culturally and linguistically appropriate medication therapy management (MTM) services. Over 12 months, pharmacists teamed with community health workers (CHWs) to provide MTM services in Connecticut and California. Face-to-face consultations occurred in Connecticut, while patients and CHWs in California used teleconferencing with the pharmacist in Connecticut. Project goals: improve drug therapy outcomes, reduce inappropriate medication use, improve medication adherence, display cost savings.

Results:

96 patients, average age 69, completed the project. Patients averaged 6.6 medical conditions and 10.3 medications. Pharmacists identified 604 medication-related problems, resolving 93%. Drug therapy outcomes increased 35%, medication adherence improved 23%, inappropriate medication use decreased 35%, and depression screening scores improved 25%. Return on investment ratio was 6:1, a savings of $3032/patient/year. Health improvements from face-to-face and telehealth MTM consultations were similar.

Lessons:

Healthcare workforce is optimized by linking CHWs with pharmacists and technology to deliver cost-effective MTM services. The approach is generalizable to populations challenged by distance, disability, language, or culture. Public health care policies need to reflect team approaches and value-based payment models.

Main messages: The virtual cross-cultural team MTM model for underserved populations has the potential to meet the triple aim goals of better care, better health, and lower costs in multiple settings.

Key messages:

- Virtual cross-cultural team MTM model for underserved populations.
- Meets the triple aim goals of better care, better health, and lower costs in multiple settings.

8.D. Infectious disease surveillance and control in the African region

Community hygiene against lassa fever disease and its predictors in a Nigerian rural settlement

Abdulrazaq Gobir

A A Gobir[1]*, CL Ejembi*[1]*, AA Aliyu*[1]*, MB Garba*[2]*, CJC Igboanusi*[2]*,*
B Usman[2]*, ZZ Umar*[2]*, IA Istifanus*[2]
[1]Department of Community Medicine, Ahmadu Bello University, Zaria, Nigeria
[2]Department of Community Medicine, Ahmadu Bello University Teaching Hospital, Zaria, Nigeria
Contact: aagobir@yahoo.co.uk

Background:

Lassa fever disease (LFD) is a viral haemorrhagic fever that is endemic in some West african countries where an estimated 300,000 to 500,000 cases and 5000 deaths occur yearly. The World Health Organization described it as a global health threat. At community level, its prevention relies on promoting good ''community hygiene''. This study was conducted to assess practice of community hygiene measures against LFD and its associated factors.

Methods:

A cross-sectional, community based descriptive study conducted during a LFD epidemic in a a rural community of Nigeria. An interviewer-administered questionnaire was used to collect data from 556 adult respondents, selected using systematic random sampling technique. Data was analyzed using SPSS.

Results:

A majority of the respondents were females (52.9%). Educational attainment was significantly associated with safe food storage at the multivariate level (aOR = 1.31, 95% CI: 1.10-1.54,P = 0.002) while having a good knowledge of LFD was a significant predictor of maintaining good housing standards (aOR = 3.73, 95% CI: 1.09-12.80,P = 0.036).

Conclusions:

Predictors of practice of community hygiene against LFD include education and having an excellent knowledge of LFD. To improve community hygiene practices in the community, there is need for a comprehensive LFD behavior change communication intervention.

Key messages:

- Cubing the global threat of LFD depends on its effective prevention in endemic West African communities.
- This study shows that such preventive measures are poor and there is need for more response to address the problem.

Asymptomatic malaria: building bridges with communities through patients in Côte d'Ivoire

Annita Hounsa épouse Alla

A Hounsa[1], D Yao[1,2], AR Attia[1], M Gokpéya[1], KJ Sackou[1], L Kouadio[1]
[1]Public Health Department Hydrology Toxicology, University Felix Houphouet Boigny, Abidjan, Cote d'Ivoire
[2]Assuefry Urban Health Centre, Tanda Health District, Assuefry, Cote d'Ivoire
Contact: allannita@gmail.com

Background:

In malaria-endemic areas, asymptomatic carriers are a reservoir of parasites that contribue to the persistence of malaria transmission. In Côte d'Ivoire, this situation is poorly documented. The objective of our study was to assess the frequency and socio-environmental factors associated with asymptomatic malaria in the town of Assuefry, located in the northeast of Côte d'Ivoire, a region where malaria prevalence remains high.

Methods:

A cross-sectional study in two stages was conducted from October to December 2018, first at the Urban Health Center (UHC) in Assuefry and then in the households. The sample size calculated for patients was 162 extrapolated to 201 people. All persons received at the CSU who had clinical symptoms of malaria and a positive Rapid Diagnostic Test (RDT) were included. In the households of these index subjects, a follow-up survey allowed active RDT screening for malaria among all household members with no clinical signs of malaria. The socio-environmental factors taken into account were: the area of residence (urban or peri-urban), domestic animals husbandry, water storage at home, nearby garbage dump, wastewater collection and disposal system, type of housing and number of people in the household.

Results:

The frequency of asymptomatic malaria was 341 (38.8%) out of 879 household members visited. Both female and male gender was concerned (51% vs. 49%). The 5 to 25 years old group concentrated nearly 82% of all cases. Only domestic animals husbandry was associated with asymptomatic malaria at the household level (p = 0.021).

Conclusions:

The high frequency of asymptomatic malaria found in this study is a challenge for the National Malaria Control Program in Côte d'Ivoire. This should be taken into account while organizing control strategies.

Key messages:

- The frequency of asymptomatic malaria in Côte d'Ivoire is high. Control strategies must take into account in the guidelines the challenges of detecting and treating asymptomatic malaria.
- For the judicious use of antimalarial drugs, any subject with a positive RDT without clinical signs of malaria should receive a 'Drop - Thick' before treatment.

Surveillance of dengue: evolution of surveillance strategies during a large outbreak, Réunion, France

Jamel Daoudi

L Menudier[1], P Vilain[1], E Robinson[2,3], E Balleydier[1], J Daoudi[1], H Thébault[4], MC Jaffar-Bandjee[5], V Muriel[1]
[1]Indian Ocean Regional Office, French National Public Health Agency, Saint-Denis, Réunion, France
[2]European Programme for Intervention Epidemiology Training, European Centre for Disease Prevention and Control, Stockholm, Sweden
[3]Department of Infectious Diseases, French National Public Health Agency, Saint Maurice, France
[4]Vector Control Unit, Indian Ocean Regional Health Agency, Saint-Denis, Réunion, France
[5]Department of Microbiology, University Teaching Hospital of La Réunion, Saint-Denis, Réunion, France
Contact: jamel.daoudi@santepubliquefrance.fr

Issue:

After a period of low-level circulation of a few cases per week during 2017, La Réunion experienced an outbreak of dengue in 2018 followed by a second and ongoing larger epidemic wave in 2019. Various surveillance systems have been progressively implemented to monitor and characterize the outbreak.

Methods:

All laboratory diagnoses of dengue are routinely notified to the regional health authority (RHA) for investigation. With the outbreak onset additional programmes were implemented including the monitoring of presentations to emergency departments (EDs) and hospitalisations of dengue cases. In addition, all death notifications to the RHA which cite dengue are reviewed by an expert committee and the cause of death classified as directly, indirectly or unrelated to dengue. Finally, weekly data from a sentinel network of general practitioners is used to estimate the number of community consultations with dengue-like illness across the island.

Results:

In 2017, 97 dengue cases were notified, with low level circulation continuing through the austral winter. In 2018, 6,679 cases (exclusively serotype 2) were notified. Western and southern regions of the island were most affected. The supplementary surveillance identified over 500 ED presentations for dengue-like illness and 160 hospitalisations. Three deaths were determined to be directly due to dengue, while 3 were indirectly related. Finally, there was an estimated 26,000 consultations for dengue-like illness in the community. After a second winter of persistent circulation, a second epidemic wave commenced in December 2018, and is still ongoing.

Lessons:

The implementation of additional surveillance systems enabled a better understanding of the magnitude and impact of the outbreak. The use of sentinel network allowed the estimation of the number of people affected in the community without a laboratory diagnosis. The ongoing viral circulation since 2017 suggests a high risk of endemisation of dengue on the island.

Key messages:

- The outbreak has had a significant impact of health and community health services, and on the wider population.
- The second consecutive austral winter with interrupted transmission suggest a high risk of endemisation.

Influenza-associated morbidity and mortality in Tunisia

Hind Bouguerra

H Bouguerra[1], A Hechaichi[1], L Bouabid[1], R Yazidi[2], N Abdeddaiem[3], L Maazaoui[3], A Moussi[4], J Ben Khelil[5], A Ben Salah[2], N Ben Alaya[1,3]
[1]Epidemiology, National Observatory of New and Emerging Diseases, Ministry of Health, Tunis, Tunisia
[2]Epidemiology, Pasteur Institute of Tunis, Tunis, Tunisia
[3]Public Health, Primary Healthcare Direction, Ministry of Health, Tunis, Tunisia
[4]Microbiology, Charles Nicole Hospital, Tunis, Tunisia
[5]Intensive Care Unit, A. Mami Hospital, Tunis, Tunisia
Contact: hind_296@hotmail.fr

Background:

Influenza is a highly contagious viral infection representing a public health problem worldwide with more than 10% of the population affected each year. In addition, severe complications and deaths may occur especially among high-risk groups. Our objectives was to assess the severity of influenza in Tunisia from 2015 to 2017 and to identify the isolated circulating viruses.

Methods:

Basedon the network of ILI (Influenza-like illness) and SARI (Severe acute respiratory infection) Sentinel Sites and the National Influenza Center, we conducted a descriptive analysis of all data collected from 2015 to 2017. The case definitions of ILI and SARI were those recommended by WHO. Data entry was using Epi-Data and data analysis using SPSS-20.

Results:

The total number of SARI cases during 2016-17 season was 614. The hospitalization rate was 0.7% which was higher than the 2015-16 season (0.19%). The majority of these severe cases were males (60,3%) and the group aged more than 65 years was the most affected. Comorbidities were reported in 58,7% of the cases, especially cardiovascular diseases, obesity and asthma. In 2016-17, the viruses identified in SARI cases were type A(H3N2) (47,7%), type B (40,9%) and type A (H1N1) pmd09 (4%). The lethality rate was lower than in the previous season (0.32% vs 20%) with two deaths reported in February. These deaths were due to virus B and virus AH3N2, comparing to 77% of deaths due to virus A (H1N1) pmd09 the season before.

Conclusions:

Influenza severity vary from a season to another. The 2016-17 season was marked by higher rates of hospitalization but a lower lethality rate. This may be due to a lower circulation of the type A (H1N1) pmd09 virus, which virulence is much discussed. Influenza surveillance remains essential to detect any emerging novel pathogen and to guide decision-makers for future strategies.

Key messages:

- Seasonal influenza epidemics continue to have significant morbidity and mortality.
- Epidemiological and virological surveillance are highly essential for an early detection of epidemics and novel strains.

Hepatitis B vaccination status and vaccine immune response among children in rural Senegal

Lauren Perieres

Contact: lauren.perieres@etu.univ-amu.fr

Background:

Hepatitis B vaccination during childhood is key to reduce the prevalence of Hepatitis B virus (HBV) infection. In Senegal, a highly endemic country, the three-dose hepatitis B vaccine and the birth dose vaccine were introduced in the Expanded Programme on Immunization (EPI) in 2004 and 2016 respectively. This study aimed to determine chronic HBV infection prevalence, hepatitis B vaccination status and vaccine immunity among children in Senegal.

Methods:

A cross-sectional study including HBV screening was conducted at home among children aged 6 months to 15 years (i.e. born after the introduction of the HBV vaccine in the EPI) in the rural zone of Niakhar. Dried Blood Spot (DBS) samples were collected for the detection of HBsAg, anti-HBc Ab and anti-HBs Ab using chemoluminescence. Vaccination status was assessed using information on vaccination cards. Detectable vaccine immunity was defined with an adjusted DBS threshold of $DOI \geq 0.36$ IU/mL (corresponding to 10 IU/mL in venous blood sampling).

Results:

Between October and December 2018, 455 children were enrolled. Preliminary results show that 7/455 (1.5%) had been in contact with HBV (positive anti-HBc Ab) and 5/455 (1.1%) had chronic HBV infection (positive HBsAg).

Only 161/455 (35.4%) children had a vaccination card available. Among those, 150/161 (93.2%) received at least 3 doses of hepatitis B vaccine, of which 83/150 (55.3%) had detectable vaccine immunity. The proportion of children with detectable vaccine immunity was significantly higher in children <5 years than in children aged 5-9 and 10-15 (72.3% versus 47.3%, $p = 0.006$ and 72.3% versus 14.3%, $p < 0.001$).

Conclusions:

Preliminary results suggest a low prevalence of HBV chronic infection among children born after the introduction of HBV vaccination in Senegal. However, detectable vaccine immunity rapidly decreases with age among vaccinated children, signalling a need for further studies on the immune response to HBV vaccination in this context.

Key messages:

- HBV chronic infection is low among children born after the introduction of HBV vaccination in Senegal.
- Further studies on the immune response to HBV vaccination in this context are needed.

Multiple interventions to strengthen immunization services in an Angolan district

Mattia Fattorini

M Fattorini[1], *G Raguzzoni*[2], *C Cuccaro*[1], *N Nante*[1,3], *C Quercioli*[4], *JMN Ndilimondjo*[5], *C Caresia*[6], *G Putoto*[7]

[1]Post Graduate School of Public Health, Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
[2]Post Graduate School of Public Health, University of Bologna, Bologna, Italy
[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
[4]Hospital Val d'Elsa, Local Health Unit Tuscany South-East, Siena, Italy
[5]Hospital Management, Catholic Mission Hospital of Chiulo, Chiulo, Angola
[6]Local Health Coordination, Doctors with Africa CUAMM, Padua, Italy
[7]Operational Research Unit, Doctors with Africa CUAMM, Padua, Italy
Contact: fattorini7@student.unisi.it

Background:

Immunization represents one of the most effective intervention in public health. In the Sustainable Development Goals era, adequate vaccination services are still crucial for the prevention of infectious diseases and the reduction of under-5 mortality. However, in 2017 WHO estimated that children <1 year who did not receive the third dose of Diphtheria-Tetanus-Pertussis (DTP3) vaccine were 19.2 million globally, and 600000 of these were located in Angola, a Sub-Saharan country with an estimated DTP3 coverage of 52%. Since 2000, Italian Non-Governmental Organization (NGO) Doctors with Africa CUAMM supports the activity of the hospital of Chiulo in the commune of Mucope (district of Ombadja, south of Angola). Aim of the study is to describe the interventions implemented to strengthen the immunization services performed by the hospital Public Health Staff (PHS).

Methods:

In May 2018 the NGO started to implement multiple interventions to enhance the number of vaccine doses administered. Firstly, outreach immunization sessions were reorganized and reinforced, for example involving local Community Health Workers in the identification of villages with a high burden of unvaccinated children. Other actions were the continuous training of the PHS in data collection and the increased collaboration with the Ombadja District Health Department in order to develop a more efficient vaccine supply chain at local level.

Results:

In 2018, among children <1 year the PHS administered 19746 doses, with a 22.3% growth compared to 2017 (15349 doses). Doses administered during outreach sessions increased by 35.4% (6597 versus 4259 doses). Estimated DTP3 coverage in Mucope commune was 71% (2017, 59%).

Conclusions:

The WHO "Reaching Every Community" strategy emphasizes the importance of high quality immunization services in hard-to-reach areas. The organisation of well-functioning immunization services requires a multifaceted approach by the involved stakeholders.

Key messages:

- In 2017, globally 19.2 million of children <1 year did not receive the recommended three DTP doses. Six-hundred thousand were located in Angola.
- To obtain and sustain an adequate vaccination coverage, especially in hard-to-reach areas, multiple and well-coordinated actions should be implemented by all the involved stakeholders.

Sentinel physicians network in Reunion: an essential and key actor for epidemiological surveillance

Jamel Daoudi

J Daoudi[1]
[1]Indian Ocean Regional Office, The French Public Health Agency - Indian Ocean Regional Office, Saint-Denis, Reunion, France
Contact: jamel.daoudi1@gmail.com

Issue/Problem:

The surveillance of seasonal infectious diseases in Reunion is based on a Sentinel physician's network of 52 volunteers, which is coordinated by the Indian Ocean regional office.

Description of the problem:

The main objectives are to identify and monitor outbreaks of infectious diseases like influenza-like-illness (ILI) gastroenteritis, dengue, and conjunctivitis. A virological surveillance set up to characterize circulating respiratory viruses from a nasal swab collected by the physicians. Swabs are tested by RT-PCR for influenza in the reference laboratory.

Results:

The surveillance demonstrated that the influenza season during the 2018 austral winter ran from September to October. More than 55 000 consultations related to ILI were estimated. The virological surveillance confirmed the circulation of A (H3N2) principally in 2018. The physician's network identified the first cases of chikungunya in Réunion Island in 2005 and data collected by this physician's network provide the epidemic trends with weekly estimation's of total numbers of consultations in the Reunion Island. More than 25 000 community consultations of dengue-like-illness have been estimated. The physician's network took part in the surveillance of conjunctivitis outbreak in 2016 and identified an outbreak of norovirus gastroenteritis in Reunion Island in 2007 and 2012.

Lessons:

This network is an essential tool for disease surveillance and control activities.

Key messages:

- The network provides provisional virological and severity data on circulating influenza several months before the onset of influenza season in mainland France.
- The network is engaged and active which enables the early detection of any emergent diseases.

8.E. Informing the health policy process

Health and healthcare in the year 2040 – Facts for planning a complex and uncertain future

Birger Forsberg

T Funk[1], *B Forsberg*[1]
[1]Region Stockholm, Stockholm, Sweden
Contact: birger.forsberg@sll.se

Background:

In the Stockholm region, a regional political assembly is responsible for health care services for a population of 2.3 million. In November 2017, the political leadership decided on a programme to project health and healthcare developments in the Stockholm region until 2040 as a basis for a longterm health plan. This presentation aims to describe the methodology used, share some results and raise some questions for further work. Through the presentation we also seek collaboration with European partners involved in similar health planning work.

Methodology:

Six perspectives for analysis were defined and under each a set of areas for deeper analysis identified. It was agreed that the planning should be fact-driven. Under the constraint of availability, data covering the period 2000 to 2017 was collected for around 90 variables. Data was gathered from various publicly available databases and was analysed in Microsoft Excel.

Results:

Stockholm's population increased continuously since the millennial shift and could increase by another 28% until 2040. Since 2000, life expectancy increased by 2 years for women and 3 years for men. More than 85% of the burden of disease is caused by chronic diseases. However, the overall disease burden per 100 000 population has been decreasing over the years. In 2017, more than 21 million outpatient care visits were done. Extrapolations of these trends show that the disease burden per capita will continue to decrease, but the total burden of disease as well as demand for health care will continue to increase.

Discussion:

A fact-based analysis of future health and healthcare proved to be an efficient base for planning and discussions of future health care services. Results confirmed some well-established perceptions of developments but also pointed to some misconceptions and established "facts" that proved to be false. New digital services make prediction of the future health service mix dynamic and challenging.

Key messages:

- To meet future health care needs, future health and health care trends should be planned for and considered in decision making processes.
- Forecasts and health care planning should be fact-based to have an as accurate picture of future health and health care trends as possible.

The Public Health Implications of Brexit in Wales: A Health Impact Assessment (HIA) approach

Liz Green

L Green[1]
[1]Public Health Wales, Wrexham, UK
Contact: liz.green@wales.nhs.uk

On March 29th 2019, the United Kingdom was due to exit the European Union (EU) in a process known informally as 'Brexit'. The 2 years before this time (and ongoing) experienced a period of unprecedented political and social upheaval with many unknowns and much uncertainty attached to the outcomes and future impact of withdrawal and transitionary period.

Public Health Wales commissioned the Wales Health Impact Assessment (HIA) Support Unit to carry out a HIA of Brexit in Wales to assess the potential impact, extent and nature of 'Brexit' on health and wellbeing in Wales which would to inform its planning, future work and support other bodies decision-making, planning and policymaking.

A comprehensive HIA was conducted over a 6 month period in 2018/19, steered by a Strategic Advisory Group. Methods included; a literature review; stakeholder workshop; interviews with policy leads, a community health profile, and report with evidence synthesis.

Trade agreements, economic impacts, changing relationships with EU agencies, uncertainty and loss of regulatory alignment were key pathways for health impacts to occur. Potential impacts included; food standards/safety; environmental regulations; working conditions; and health and social care. Many impacts will affect the whole population. Vulnerable populations included; children/young people; those at risk of unemployment;Welsh areas receiving significant EU funding. Potential indirect impacts were identified on mental wellbeing.

Brexit has the potential to impact significantly on the determinants of health.The HIA has informed and influenced cross-sector planning and policy in response to the short/long-term implications of Brexit to ensure that health and inequalities are considered at every juncture.This unique work demonstrates continued leadership by Wales in the field of impact assessment and 'health in policies' and has been positively received. It has transferable learnings for many nation states and health policy leads.

Key messages:

- Brexit is a major policy change with major health impacts.
- HIA is an informative and influencing process to support planning and future policy making.

Danish policymakers and research evidence in public health policy process

Natasa Loncarevic

N Loncarevic[1], *M Bertram*[1], *P Tanggaard Andersen*[1]
[1]Unit for Health Promotion, Department of Public Health, University of Southern Denmark, Esbjerg, Denmark
Contact: nloncarevic@health.sdu.dk

Background:

Evidence-informed policymaking in public health, understood as interaction of the best available research evidence and ''other types of evidence'', is known to have sound influence on population well-being. However, lack of using and producing research evidence by public health policymakers has been well documented. The aim of this study was to assess policymakers' research involvement in the research process as well as motivators and barriers for the use and production of research evidence.

Methods:

A cross-sectional online survey was carried out in the period of Dec 2018 - Jan 2019 using a pre-tested, self-administrated questionnaire. Participants were Danish policymakers' members of the Danish Society of Public Health (DSPH) and with practical experience being involved in a health policy-making process. The questionnaire was distributed through the DSPH members email list. Reported outcome variables; for this abstract are parts of the larger study: health policymakers' research involvement in the last 12Mo; policymakers' motivators and barriers to use and produce research in policy-making.

Results:

Response rate: 100/480 (15%). 78% were involved in critical evaluation of research for policy-making; 77% were able to identify relevant research literature; 41% did not use research evidence; 40% did not conduct any surveys; 57% did not write research reports; 65% never used reference systems; 46% did not analyze any research data. The three motivators reported to use and produce research in the last 12Mo were: identification of the problem that needs to be addressed; development of research skills; and job satisfaction. The three main barriers were: other job-related priorities; lack of time for research; lack of research funding.

Conclusions:

This study reinforced that public health policymakers need more practical knowledge and skills as well as organizational support and management to use and produce research evidence for evidence-informed policy-making.

Key messages:

- Successful evidence-informed policymaking requires capacity-building interventions targeting policymakers, supported, implemented and evaluated by their organizations.
- Policymakers do not dismiss evidence-informed policy practice, but their ''positions'' and conditions at a work place sometimes do not allow them to fully follow it.

Situation analysis on evidence-informed health policy-making in Poland

Katarzyna Dubas-Jakóbczyk

K Dubas-Jakóbczyk[1], *E Kocot*[1], *A Domagała*[1], *T Mikołajczyk*[2], *J Adamski*[2], *T Kuchenmüller*[3]
[1]Institute of Public Health, Jagiellonian University Medical College, Krakow, Poland
[2]Department of Analysis and Strategy, Ministry of Health, Warsaw, Poland
[3]Division of Information, Evidence, Research and Innovation, WHO EURO, Copenhagen, Denmark
Contact: katarzyna.dubas@uj.edu.pl

Background:

Over the last few years, increased international attention has been paid to bridging the gap between health research and policy-making. The situation analysis on evidence-informed policy-making (EIP) in Poland aims to increase understanding of interactions among a country's research and policy-making communities, to determine where and how to best establish a knowledge translation platform (KTP), i.e. an organization or network that through its structure and functioning brings the worlds of research and policy together.

Methods:

The methods were guided by the EVIPNet Europe Situation Analysis Manual and included a literature review, key-informant interviews and survey data analysis.

Results:

In Poland, the existence of incentives or requirements stipulating the use of research evidence in health policy varies, depending on the type of policy. The use of evidence is a standard practice in drug policy, and in decisions related to the inclusion of services in the health benefit package. In other areas, some good practice examples of using evidence in policy can be identified. Yet these are rather individual, isolated and bottom-up initiatives, which neither occur systematically, nor routinely. Key challenges in view of strengthening a systemic approach to EIP relate to: overlapping mandates of key health system and research institutions, generally low research capacity and lack of knowledge translation skills.

Conclusions:

Establishing and operationalizing a KTP can be an effective means of supporting sustainable EIP. Building such infrastructure, however, is a longer-term and complex process that needs to be based on the current characteristics of the country's EIP landscape. The proposed model of a future KTP in Poland is a network with a joint secretariat within the Ministry of Health. Such form can take advantage of existing organizations' competencies via information exchange and cooperation.

Key messages:

- Although systemic mechanisms for evidence-informed health policy are missing in Poland, its importance is recognized among major health system stakeholders.
- The proposed model of a future knowledge translation platform in Poland is a network with a joint secretariat within the Ministry of Health.

Towards a deliberative approach in public health policy making

Wannes Van Hoof

W Van Hoof[1], *C Mayeur*[1]
[1]Cancer Center, Sciensano, Brussels, Belgium
Contact: wannes.vanhoof@sciensano.be

The time when public health policies could be based solely on expert opinion has gone. Public opinion has a real impact on the effectiveness of public health policy. However, for complex issues such as vaccination, screening, GMO's, privacy and data governance, public opinion is divided. How to integrate divided public opinions into a well-structured health policy? In Belgium, as in many other countries, policy makers have started to turn to deliberative processes to guide policy making with citizen involvement, especially in ethically contentious areas.

Deliberative processes aim to involve citizens in policy making in a setting where individual opinions and interests are weighed honestly and fairly, so that through well informed deliberation common ground can emerge. Participants are informed by a neutral information package, a variety of experts and facilitated discussions. In a very transparent way, these positions are molded into tailored policy inputs. In Belgium, such initiatives have recently been organized on biobanking, genomics, e-health, reimbursement policies and more. In France, the government is obliged by law to organize a comprehensive deliberative public consultation on bioethical issues every seven years.

Especially in areas that require a large degree of trust, a deliberative approach ensures policies that can be supported by people with diverse views. They offer a viable alternative to traditional models of power and conflict that is more suitable to governance in 21st century democracies. They allow citizens to make a meaningful contribution to topics they may not have been familiar with beforehand, but that do touch on their private lives and interests.

The most recent Belgian initiative resulted in nine concrete policy inputs for the implementation of genomics in health care, presented directly by the citizens to the Minister of Public Health. The French initiative is the basis for the current review of the law on bioethics in parliament.

Key messages:

- Public health issues touch the interests of all citizens: citizen deliberation should be regarded as an important input for public health policies.
- A deliberative approach enhances public trust, especially in areas of social or ethical contention.

Health is not for sale, is it?

Thomas Plochg

T Plochg[1], *S Hinrichs-Krapels*[2,3], *J Keijsers*[4]
[1]Federation for Health, Amersfoort, Netherlands
[2]King's Global Health Institute, London, UK
[3]The Policy Institute, London, UK
[4]TNO, Leiden, Netherlands
Contact: t.plochg@federatievoorgezondheid.nl

Issue/problem:

Health is not for sale, given that one cannot buy health as a guaranteed commodity. Human beings co-produce their health every day together with their (social) ecosystems. As such, being healthy is a co-adaptive, complex, and self-organizing enterprise. However, our current economies thrive on citizens who consume themselves ill, and buy health care to fix their diseases. With spiralling costs of healthcare, a shift is urgently needed towards making a business case for health.

Description of the problem:

From 2014 onward, the Dutch Federation for Health invested in the development of a business case for health. They explored the following questions: 1) Why is a business case for health warranted? 2) What could such a business model theoretically look like? 3) How could it be co-created in practice?

Results:

- We found there is a business case to keep diseases going, driving healthcare expenditure up. Literature suggests that this business case for disease is untenable.
- Inevitably we need new incentives that keep 'health' going rather than disease. We need a mechanism to make the business care for health.
- We have begun to model one approach named the 'vitality contract', featuring 10 organizational principles which provide guidance on how to construct the right market structure for health to be co-produced and sold on the premises of an ecosystem.
- The Federation for Health has been championing this vitality contract, and succeeded to get it on the national policy agenda. However, co-creation is essential for it to work: only few coalitions have risen to the challenge to make such a 'vitality contract' work in practice.

Lessons:

The business case for health is needed. The vitality contract might provide one approach to demonstrate how it could be co-created in different local contexts and different public health systems. To be more impactful, further co-creation and collaboration from national coalitions and other European countries may be required.

Key messages:

- With spiraling costs of healthcare, a shift is urgently needed towards making a business case for health.
- The Dutch 'vitality contract' might provide one approach to demonstrate how a business case for health could be co-created.

Southeastern Regional Health Information System: a mapping tool for public health actors

Marie Jardin

M Jardin[1], *P Kurkdji*[1], *L Dagnet*[2], *G Tonnaire*[3], *S Nauleau*[3], *P Verger*[1,4,5], *V Guagliardo*[1]
[1]Southeastern Health Regional Observatory (ORS Paca), Marseille, France
[2]Southeastern Regional Council (Région Sud Provence-Alpes-Côte d'Azur), Marseille, France
[3]Southeastern Regional Health Agency (ARS Paca), Marseille, France
[4]Aix Marseille University, IRD, AP-HM, SSA, VITROME, Marseille, France
[5]IHU-Méditerranée Infection, Marseille, France
Contact: marie.jardin@inserm.fr

Issue/problem:

Local public health actors often need to identify public health priorities in their territories to guide public health policy and/or action.

Description of the problem:

The Southeastern Health Regional Observatory (ORS Paca) has been developing since 2006 a health information system for Southeastern France (SIRSéPACA). The objective of this mapping tool is to give access to regional and local public health actors to public health indicators for various population groups and geographical scales (municipality, districts...) within the region.

Results:

Indicators are displayed under the format of maps and tables on the following topics: morbidity, mortality, health social, economic or environmental determinants. Indicators are constructed using national and regional databases (open or accessible through agreements). SIRSéPACA is in free access (www.sirsepaca.org) and regularly updated. A function allows the users to obtain a portrait for a defined geographical area and to obtain in one click a description of various indicators (socio-economic and demographic characteristics, mortality and morbidity causes, health care and prevention, environmental health). Indicators for a given territory can be compared to the regional average (or another area). SIRSéPACA is regularly used to provide a description of the main public health characteristics of territories (''territorial diagnose''), e.g. to help health professionals intending to set up of a multidisciplinary group practice designing their project.

Lessons:

Trainings on how to use the tool, interpret the maps produced, and about territorial diagnoses implementation are regularly done. We are also developing a similar tool for all French regions for the Ministry of Health.

Key messages:

- SIRSéPACA facilitates access to and overview of a lot of indicators and data for local public health actors.
- This regional experience has been expanded to national level.

The EU Health Promotion and Disease Prevention Knowledge Gateway

Ioanna Bakogianni

I Bakogianni[1]
[1]Joint Research Centre, European Commission, Ispra (VA), Italy
Contact: Ioanna.BAKOGIANNI@ec.europa.eu

Issue/ problem:

Unhealthy diets, physical inactivity, alcohol and tobacco use are leading risk factors for non-communicable diseases. They are all modifiable and health promotion policies can support that.

Description of the problem:

However, information overload, controversies and uncertainties, budget constraints and difficulties in balancing disparate interests are common challenges that can hamper action by policy makers in the field of public health. To support them, the European Commission has created the Health Promotion and Disease Prevention Knowledge Gateway. It is a reference point for independent and reliable information to assist policy making; it summarises both the data and knowledge needed to support prioritisation of public health policies and justify investments in health promotion.

Results:

The Knowledge Gateway currently covers the areas of nutrition, physical activity, alcohol, marketing of foods and beverages, and related societal impacts such as disease burden and health inequalities. These topics have been prioritised by Member States representatives and policy makers. The content is organised into concise, well-structured briefs which include definition of each issue, health related effects, and examples of policy recommendations and implemented policies. The high-quality source documents are selected in a tiered approach and are mainly authored or endorsed by authoritative public health organisations.

Lessons:

Judging by the positive feedback received, the Knowledge Gateway is being used widely across Member States and stakeholders. The content of the Knowledge Gateway will be further expanded to support other health priorities such as mental health promotion. Policy makers have a unique, trusted ‘‘one-stop-shop’’ with high quality information to support, justify and strengthen the development of public health policies and health promotion.

Key messages:

- The use of reliable authoritative information for the development of public health policies can support the prevention of major non-communicable disease risk factors.
- The EU Knowledge Gateway is a unique reference point of reliable, independent information to support policy making in the area of public health.

8.F. Promoting child centred health systems

Validation of a Screening Tool for Social Vulnerability in Pediatrics

Remi Laporte

R Laporte[1,2], E Jouve[2], A Daguzan[2], S Gentile[2]
[1]PASS Mère-Enfant, Assistance Publique - Hôpitaux de Marseille, Marseille, France
[2]CEReSS - EA 3279, Aix Marseille Université, Marseille, France
Contact: remijulien.laporte@ap-hm.fr

Background:

Screening for social vulnerability is emphasized improve access and quality and of healthcare. In pediatrics although some specific tools exist, a global screening tool for social vulnerability and access to healthcare was missing. A Vulnerable Child Scale (VUCHIS) was developed with expert focus groups. It included short evaluation about several issues: medical follow-up, health assurance, children schooling, housing, close entourage, comorbidities, recent migration, language comprehension and food insecurity. Fifteen items were addressed in a short and easy to translate interview. The aim of this study was to validate this tool.

Methods:

This multicenter study was conducted in two pediatric emergency departments in France. VUCHIS questionnaire was completed by the emergency department caregiver. Another blinded interview with a social worker, expert in social vulnerabilities diagnosis, was conducted to assess the need for care in a clinic for socially vulnerable children. Clinical exam was recorded. The main criteria for this study was the clinimetric properties of VUCHIS compared to the expert caregiver opinion.

Results:

480 children were included. Their mean age was 8.3 years (SD = 3.8); 264 (55.0 %) were boys. The expert evaluation identified 57 (11.9 %) children with social vulnerabilities. VUCHIS ranged from 0 to 79 (mean = 6.9; SD = 14.7). ROC curve area was 0.83 (SD = 0.04). The selected diagnostic threshold was 10. This showed sensitivity = 0.70; 95% confidence interval (CI) = [0.56; 0.81]; specificity = 0.89; CI = [0.86; 0.92]; positive likelihood ratio = 6.60; CI = [4.77; 9.12] and negative likelihood ratio = 0.33; CI = [0.22; 0.50].

Conclusions:

VUCHIS has good clinimetric qualities that will promote the screening of social vulnerability in pediatric clinical practice.

Key messages:

- Pediatricians need global and easy-to-use tools to implement social vulnerabilities in their clinical routine, especially in emergency departments.
- Implementing tool-mediated screening for social vulnerabilities in pediatrics prevent inappropriate orientation and prescriptions and poor therapeutic adherence.

Can nurses improve self-management among pediatric patients? A systematic review and meta-analysis

Corrado De Vito

A Mele[1], A Nardi[1], GP Prencipe[1], G Migliara[1], A Massimi[1], ML Rega[2], G Anderson[2], D Casasanta[2], C De Vito[1], G Damiani[3,4]
[1]Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy
[2]School of Nursing Università Cattolica del Sacro Cuore, Rome, Italy
[3]Fondazione Policlinico Universitario A. Gemelli IRCCS, Rome, Italy
[4]Università Cattolica del Sacro Cuore, Rome, Italy
Contact: corrado.devito@uniroma1.it

Background:

Few studies report educational interventions for pediatric patients with asthma or diabetes type 1 as a fundamental instrument to engage them and improve their health. The aim of this systematic review and meta-analysis was to synthesize evidence about behavioral changes in life style, disease management and clinical outcome in pediatric patients after a structured educational intervention delivered by nurses.

Methods:

A systematic review of the literature was carried out in MEDLINE, Scopus and CINHAL including only RCTs. Methodological quality of the studies was assessed using Cochrane tool. Meta-analyses on HbA1c reduction for diabetes and hospitalization, emergency department (ED) visits and medication for asthma were carried-out.

Results:

Of the 3559 papers initially retrieved, 5 regarding diabetes and 19 asthma met the inclusion criteria for the systematic review and 14 for the meta-analyses. Included studies were highly heterogeneous in terms of type of intervention and follow-up duration. Almost all the studies showed an improvement but only few were statistically significant. All studies regarding diabetes showed a low risk of bias (only one RCTs had a high risk of bias in one domain), while almost all RCTs on asthma showed a high risk of bias. The pooled mean differences in favor of the experimental groups were: HBA1c -0.02 (IC95%: -0.26 - 0.22), Hospitalization 0.58 (IC95%: 0.19 - 1.78), Medication -0.10 (IC95%: -0.43 - 0.23), ED Visits 0.82 (IC95%: 0.44 - 1.54).

Conclusions:

There is a general agreement about the central role of educational intervention delivered by nurses to pediatric patients and the assessment of the behavioral changes after educational interventions is strongly recommended in pediatric population. However, more efforts are requested in designing studies on patients with asthma and to program more appropriate follow-up and periodic recall in order to engage pediatric patients in the management of their own chronic disease.

Key messages:

- educational intervention delivered by nurses to pediatric patients with asthma or diabetes type 1 as a fundamental instrument to engage them.
- more efforts are requested in designing studies on patients with asthma and to program more appropriate follow-up and periodic recall in order to engage pediatric patients.

Importance and feasibility of implementing child and parent centeredness in routine care

Michael Eichinger

M Eichinger[1,2], T Goerig[1], S Georg[1], H Philippi[3], F De Bock[1,4]
[1]Mannheim Institute of Public Health, Medical Faculty Mannheim, Heidelberg University, Mannheim, Germany
[2]Department of Pediatrics, Medical Faculty Mannheim, Heidelberg University, Mannheim, Germany
[3]Social Pediatric Center Frankfurt Central, Frankfurt, Germany
[4]Federal Centre for Health Education, Cologne, Germany
Contact: michael.eichinger@medma.uni-heidelberg.de

Background:

Child and parent centeredness (CPC) are important determinants of the quality of care for children with chronic health conditions. However, little is known about the perceptions of healthcare professionals on the importance and feasibility of implementing CPC in routine care, although both might be key for the successful implementation of CPC. We therefore assessed the perceptions of healthcare professionals concerning this matter and analysed, how familiarity with the International Classification of Functioning, Disability and Health (ICF) might strengthen CPC.

Methods:

Cross-sectional data was collected in 12 specialized interdisciplinary outpatient centres providing treatment for children with chronic health conditions in Germany. The standardized questionnaire covered (1) the importance of implementing child (CC) and (2) parent centeredness (PC) as well as (3) the feasibility of implementing CC and (4) PC in routine care (based on Arnetz et al. 2008, Patient Involvement Subscale) and (5) the prior use of the ICF. Bivariate associations were assessed with permutation tests.

Results:

In total, 206 healthcare professionals were surveyed (response rate: 47 %). The perceived feasibility of implementing CPC fell short of their importance ($p < 0,001$). Moreover, CC was ranked lower than PC in terms of both importance and implementation feasibility ($p < 0,001$, respectively). Prior use of the ICF was associated with higher importance of CC ($p < 0,001$) and PC ($p = 0,01$).

Conclusions:

While the importance of CPC to healthcare professionals was high, the active involvement of children and the routine implementation of CPC were perceived as challenging. Interventions to facilitate the implementation of CPC should therefore comprise hands-on implementation strategies and put a special focus on how to involve children in routine care (e.g., through special communication techniques). Including the ICF as a conceptual framework in interventions to foster CPC could be a facilitator.

Key messages:

- While child and parent centeredness are important to healthcare professionals, their implementation in routine care and the active involvement of children are challenging.
- Interventions to foster the implementation of child and parent centeredness should include concrete practical implementation strategies and put a special focus on the involvement of children.

Exposure to car smoking among youth in seven countries of the European Union

Martin Mlinarić

M Mlinarić[1], M Schreuders[2], U Mons[3], AE Kunst[2]
[1]Institute of Medical Sociology, Martin Luther University Halle-Wittenberg, Halle (Saale), Germany
[2]Department of Public Health, Amsterdam UMC, University of Amsterdam, Amsterdam Public Health Research Institute, Amsterdam, Germany
[3]Cancer Prevention Unit, German Cancer Research Center (DKFZ), Heidelberg, Germany
Contact: martin.mlinaric@medizin.uni-halle.de

Background:

In the USA and Canada, cars are a major source of secondhand smoke (SHS) exposure among youth. Little is known about the magnitude of this public health problem in European countries. In this report, we study SHS exposure in vehicles among adolescents across 7 member states of the European Union (EU), with a particular focus on socio-economic characteristics and adolescents' smoking environment.

Methods:

Data on self-reported SHS exposure in cars during the past seven days was obtained from the 2016/17 cross-sectional SILNE-R study from 14-17-year old adolescents in EU seven countries ($N = 10,481$). We applied two multivariate logistic regression models with sociodemographic characteristics and mediating smoking-related factors.

Results:

SHS car exposure varied widely across the 7 EU countries: 6% in Finland, 12% in Ireland, 15% in the Netherlands, 19% in Germany, 23% in Portugal, 36% in Belgium and 43% in Italy. Low paternal educational levels were strong correlates of SHS exposure in cars as well as migration background. Other correlates were one's own smoking status and the relation to the family and peer smoking environment, such as parental smoking, permissive smoking rules at home, and best friends smoking.

Conclusions:

In most of these seven countries, a considerable proportion of youth, particularly those from disadvantaged backgrounds, is exposed to SHS in cars. There is a need to ensure adoption and sustained enforcement of smoke-free car legislation. Given the long-term effectiveness of smoke-free car policies, our finding suggests that such policies can contribute towards reducing smoking inequalities.

Key messages:

- We assessed adolescent secondhand smoke (SHS) exposure in cars in 7 EU countries, which varies widely, ranging from 6% in Finland to 43% in Italy.
- The findings point to a social gradient, environmental factors in SHS car exposure and call for the rapid implementation of smoke-free car legislation.

Sleep habits and sleep characteristics at 1 year-old in the ELFE birth cohort study

Sabine Messayke

S Messayke[1], P Franco[2,3], A Forhan[1], MN Dufourg[4], MA Charles[1,4], S Plancoulaine[1]
[1]INSERM, INRA, Université de Paris, Paris, France
[2]Integrative Physiology of the Brain Arousal System, UMR 5292, Lyon, France
[3]Pediatric Sleep Unit, Mother- Children Hospital, Lyon, France
[4]Unité mixte Inserm-Ined, INED, Paris, France
Contact: sabine.messayke@inserm.fr

Infant sleep plays a critical role in his/her normal development. Sleep problems, including sleep onset difficulties (SOD) and night waking (NW), ranges from 20% to 30% in infants and young children and are partially persistent over time up to adulthood. French young children seem to have longer sleep durations and less sleep troubles than their counterparts worldwide. We here aimed at describing infants sleep characteristics (duration/24h (TST), NW, and SOD) and associated sleep habits in infants aged 1 year old from the French nationwide birth cohort ELFE.

This study included 11,571 infants with information on both sleep characteristics and sleep habits (parental presence when falling asleep, eating to fall asleep, sucking pacifier or finger to sleep and the location where the infant falls asleep and ends his/her sleep). Associations were studied using multinomial logistic regressions adjusted for familial and infant characteristics.

Mean TST was 13hrs36 including 2hrs54 of naps, 20% of the infants had TST $\leq$12hrs/24h. About 46% did not present SOD or NW, while 16% had frequent SOD and 22% had NW $>$ 1 night over 2. Parental presence, feeding to fall asleep and infants sleep location were more frequent in infants having short sleep duration ($\leq$12h/24h), NW and SOD. Non-nutritive sucking was associated with NW, SOD and TST>14h/24h.

This work provides new information regarding infant sleep location and non-nutritive sucking that should be accounted for when considering sleep behaviors. In addition, most of identified sleep habits associated with poor sleep characteristics are accessible to prevention.

Key messages:

- French infants present better sleep characteristics than their counterparts.
- Most sleep habits associated with poor sleep are accessible to prevention.

Impact of sleep and screen times on incidence of overweight in European children and adolescents

Viveka Guzman

V Guzman[1,2], L Arvidsson[2,3], L Lissner[2], M Hunsberger[2]
[1]Medical Gerontology, Trinity College Dublin, Dublin, Ireland
[2]Community Medicine and Public Health, Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden
[3]Department of Public Health, University of Skovde, Skovde, Sweden
Contact: guzman.viveka@gmail.com

Background:

A deeper understanding of the modifiable risk factors leading to excess weight in children and adolescents can provide unique opportunities for preventing the immediate and long-lasting health consequences of overweight. The aim of the study was to explore independent, prospective associations of screen time and sleep duration with incident overweight in a sample of European children.

Methods:

Data from 4285 participants of the IDEFICS/I.Family cohort who were followed-up from 2009/2010 to 2013/2014 was analyzed. Hours per day of screen time and sleep duration were collected by parental report at baseline. Logistic regression analyses were carried in separate and mutually adjusted models controlled for sex, age, European country region, parental level of education and baseline BMI z-scores.

Results:

At baseline screen time (hours/day) and sleep duration (hours/day) were inversely correlated behaviors (rs = -0.226, p<.001), indicating the necessity of exploring their separate and joint effects on the weight trajectory. In the non-overweight/non-obese population at baseline (N = 3734), separate models suggest that every hour increase on screen time and every hour decrease on sleep duration were associated with higher odds of the child becoming overweight or obese at follow up (OR = 1.156, 95% CI 1.015-1.316 and OR = 1.226, 95% CI 1.053- 1.428 respectively). In the mutually adjusted model, the screen time association was attenuated to non-significance (OR = 1.125, 95% CI 0.986- 1.284), while the association with sleep duration was also attenuated but remained statistically significant (OR = 1.198, 95% CI 1.026-1.398).

Conclusions:

Both screen time and sleep duration are significant predictors of incident overweight in children and adolescents. However, according to our results sleep duration plays a stronger role than screen time, suggesting an increased value of overweight prevention strategies that emphasize adequate sleep duration.

Key messages:

- A holistic and integrated approach is needed to prevent overweight from early age and with a life-course perspective.
- New strategies for overweight prevention could benefit from prioritizing interventions that promote adequate sleep duration and reduce excessive screen time.

Estimation of direct cost related to asthma among school-age children with asthma

Maha Dardouri

M Dardouri[1], M Mallouli[1], A Amara[1], J Sahli[1], M Limem[1], M El Ghardallou[1], C Zedini[1], J Bouguila[2], T Ajmi[1], A Mtiraoui[1]
[1]Qualité des Soins et Management des Services de Santé Matern, Université de Sousse, Faculté de Médecine de Sousse, Sousse, Tunisia
[2]Service de Pédiatrie, Centre Hospitalier Universitaire Farhat Hached de Sousse, Sousse, Tunisia
Contact: dardourimaha@gmail.com

Background:

Childhood asthma still imposes a substantial burden on the health care system and community. Its management requires a significant direct cost. Several factors can influence the cost of asthma management, particularly severe asthma. There is scant information about the predictors of asthma-related cost. Thus, the purpose of this study was to estimate direct asthma-related cost among children with chronic asthma and to identify factors that have the greatest contribution to change it.

Methods:

This cross-sectional study was carried out in Farhat Hached University Hospital in Sousse (Tunisia, Africa) over a period of three months (April-June 2018) among children with asthma aged 7-17 years. The direct cost was defined as the costs of health resources utilization and medication related to asthma in the past 12 months. Purchasing power parity technique was used to convert TND to USD. Multiple linear regression was performed to examine the association between dependent and independent variables.

Results:

A total of 90 subjects participated in the study. The mean age was 9.81±2.56 and 55.6% were male. The annual mean of the total direct cost was USD 616.71±454. Multivariate analysis showed that the severity of asthma, inhalation technique and emotional domain of QOL predict asthma cost and that the latter was the best predictor (p = 0.005, p = 0.03, p = 0.004, respectively). This data indicates that for one child with mild asthma, correct inhaler technique, and moderate impairment of emotional function QOL domain, estimated asthma direct cost was equal to 1035.21 USD per 12 months.

Conclusions:

This study showed that higher severity of asthma, incorrect inhaler technique and a lower score of emotional function increased direct cost related to asthma. These results are useful for health care providers and community since they provide information about the impact of modifiable risk factors on direct asthma cost.

Key messages:

- For one child with mild asthma, correct inhaler technique, and moderate impairment of emotional function QOL domain, estimated asthma direct cost was equal to 1035.21 USD per 12 months.
- Higher severity of asthma, incorrect inhaler technique and a lower score of emotional function increased direct cost related to asthma.

8.G. The breadth of public health

Models and evidence of intersectoral cooperation in prevention and health promotion

Ulla Walter

U Walter[1], D Röding[1], S Kruse[2], N Heinze[1], V Rana[1], N Komainda[1], W Haß[3], E Quilling[4]
[1]Institute for Epidemiology, Social Medicine and Health Syste, Medizinische Hochschule Hannover, Hannover, Germany
[2]Hochschule RheinMain, Wiesbaden, Germany
[3]Federal Centre for Health Education, Cologne, Germany
[4]Hochschule für Gesundheit, Bochum, Germany
Contact: Walter.Ulla@mh-hannover.de

Background:

Inter-sectoral coalitions are regarded as a key principle of health promotion. The study examines the questions of how these are defined, which scientific theories and models are available, and which methods and parameters are used for their evaluation.

Methods:

The scoping review in three databases (PubMed, Web of Science, LIVIVO) included studies in English and German published in 1/2010 to 5/2018. The results were analyzed qualitatively. In addition, relevant websites and textbooks in the field of public health, health promotion and social work were subjected to a document analysis in an iterative procedure.

Results:

The database searches yielded 186 hits, of which 48 publications were systematically examined. Document analysis revealed 128 materials. Six common terms on inter-sectoral cooperation (network, collaboration, partnership, coalition, cooperation, alliance) were identified. Uniform definitions and unambiguous distinctions do not exist. Overall, only a few of the identified inter-sectoral collaborations are theoretically based, nine publications present models. Only seven studies provide insights into the effectiveness of model/theory-based strategies, whereby these almost exclusively examine output parameters. In particular, there are parameters on structure and process (e.g. team functioning, coalition capacity). Qualitative success factors and barriers were identified (e.g. integration of different actors, development of new financial sources, formalization). Eight validated instruments are identified. Four studies also examine the outcome level and demonstrate intended effects on behavioral parameters.

Conclusions:

For research and practice, it is necessary to sharpen the terminology of intersectoral cooperation. Existing models should be systematically used and evaluated. In the future, an evaluation of the outcome of inter-sectoral cooperation and long-term effects will be increasingly necessary.

Key messages:

- Inter-sectoral coalitions are an evolving field, and both their theoretical foundation and empirical testing are still in their infancy.
- While success factors are well investigated, evaluations at the outcomes level are particularly necessary.

The development of a monitoring instrument to measure the strength of health promoting systems

Gerdine Fransen

G Fransen[1,2], A Wagemakers[3], G Molleman[1,2]
[1]Primary Health Care, Radboudumc, Nijmegen, Netherlands
[2]Healthy Living, Municipality Health Services, Nijmegen, Netherlands
[3]Wageningen University and Research, Wageningen, Netherlands
Contact: gfransen@ggdgelderlandzuid.nl

Background:

In the region of the Municipality Health Services Gelderland-South, each municipality has its own health broker. He or she advises the local policy makers, signals/pleads for addressing health problems, and facilitates effective approaches. By doing this health brokers try to strengthen the local health promoting system. To show the results of health brokers and to monitor changes of the local health promoting system, the MHS needs a monitoring instrument. The aim of this study was to develop this instrument and to test it in practice.

Methods:

Participatory action (qualitative) research is used to develop an online questionnaire. Structured group processes with the health brokers has led to the identification and definition of eight variables, reflecting the health promoting system: collaboration, support, integrated approach, visibility of results, health monitor data assessment, consistency, reach of the target population and sustainability. A literature study identified appropriate instruments. The online questionnaire is expanded to test the reliability, to evaluate the usability and to gain insight into the strength of the health promoting system in 16 municipalities.

Results:

The questionaire is based on validated questionaires like the Coordinated Action Checklist, and contains 28 items. Sumscores per variable ranged from 0 (weak) to 100 (strong). Health brokers and their partners (N = 147, 4-9 per municipality) filled out the questionnaire. Support and collaboration had the highest mean scores (70,5 resp. 69,8), and visibility of results and sustainability the lowest (61,3 resp. 59,4). Differences between municipalities were identified and can be used to know which variables can be improved. The test-retest reliability (mean r = 0,713) and the Crohnbachs alphas (all > 0,70) were reasonable good.

Conclusions:

The questionnaire can help to provide useful insights in the strengths and weaknesses of the local health promoting system.

Key messages:

- Eight variables reflect the health promoting system: collaboration, support, integrated approach, visibility of results, health monitor data assessment, consistency, reach and sustainability.
- The questionnaire can help to provide useful insights in the strengths and weaknesses of the local health promoting system.

The necessity of applying Rasch measurement theory in questionnaire-based public health research

Hanne Søberg Finbråten

HS Finbråten[1], AL Kleppang[2], AM Steigen[1]
[1]Health and Nursing Sciences, Inland Norway University of Applied Sciences, Elverum, Norway
[2]Public Health and Sport Sciences, Inland Norway University of Applied Sciences, Elverum, Norway
Contact: hanne.finbraten@inn.no

Background:

Questionnaires are frequently used in public health research. In order to provide valid and reliable results to generate recommendations for practice and policies, scales with sound psychometric properties are required. Classical test theory such as factor analysis is most frequently used to assess the psychometric properties of scales. However, classical test theory may have limitations in confirming the validity of scales. Only Rasch measurement theory meet the requirements of fundamental measurement, such as additivity, invariance, sufficiency and specific objectivity. The objective is to exemplify how Rasch measurement theory can be used to evaluate the psychometric properties of a scale. Validation of the Hopkins Symptom Checklist-10 is used as an example.

Methods:

This study is based on cross-sectional data from the Youth Data Survey. In total, 6777 adolescents responded to a web-based questionnaire. Data collection was carried out in lower and upper secondary schools in Norway during 2018. The data were analysed using the partial credit parameterization of the unidimensional Rasch model.

Results:

Preliminary results indicated that the scale had acceptable reliability (person separation index: 0.82). However, one pair of items shows response dependence. The targeting could have been better (mean person location: -1.445). All items had ordered thresholds. Three items under-discriminated. Several items displayed differential item functioning with regard to gender and school level.

Conclusions:

Applying Rasch measurement theory measurement problems that would go undetected using classical test theory approaches were observed. Scales used in public health research should be thoroughly validated applying Rasch measurement theory before the data are used to support claims about public health and used to provide recommendations for policy and practice.

Key messages:

- Public health practice and policy should be based on information from valid and reliable scales.
- Rasch measurement theory should be used to evaluate psychometric properties of scales used in public health research.

Tuberculosis contact investigations in congregate settings in Rome, Italy: contribution of migration

Monica Sane Schepisi

M Sane Schepisi[1], *AS Miglietta*[1], *C Cerocchi*[1], *P Grillo*[1], *S Renzi*[1], *R Cirilli*[1], *R Pavone*[1], *S Vaccarello*[1], *F Magrelli*[1], *G De Angelis*[1]
[1]Dipartimento Prevenzione, Local Health Unit ASL ROMA 2, Rome, Italy
Contact: msaneschepisi@gmail.com

Background:

In middle to low incidence countries tuberculosis (TB) is known to concentrate in big cities as national incidence falls: in the last decade TB incidence in Rome metropolitan area and in Lazio region has been higher than the national estimates; TB incidence among foreign born fell by more than half despite remaining higher than among Italian born.

We aimed to describe the current dynamics of TB transmission among residents of our local health unit in Rome metropolitan area in order to drive specific TB control interventions at local level.

Methods:

We retrospectively evaluated characteristics of TB cases and results of contact investigations among the residents of ASL Roma 2 in congregate settings over year 2018.

Results:

Overall 217 TB cases were notified, of which 70.5% with pulmonary involvement. Male/female ratio was 2.4/1 and age group most affected was 25-44 among foreign born and >65 among natives. During the study period foreign born cases accounted for 65% of the total number of TB cases. 19/141 (13.5%) foreign born patients were hosted in a reception center. 479 exposed close contacts were screened, with no evidence of secondary TB disease transmission. No identifiable links were found among cases occurred in the same immigrant reception center.

Conclusions:

Italian guidelines recommend symptom screening for TB and LTBI testing both of new entrants and of long term residents - including second–generation migrants- from high TB burden countries. These findings suggest that local public health efforts should prioritize the identification of reactivations of remotely acquired latent TB rather than of new postarrival infections acquired in the host county through local transmission.

Key messages:

- City-specific data on TB incidence trends among native and foreign-born residents help understanding the wider interaction between migration and TB.
- To prevent TB incidents in congregate settings remotely acquired latent TB should be targeted.

Mesothelioma: a rare cancer in the Valencian Region's Cancer Registry (Spain)

Clara Cavero Carbonell

C Cavero Carbonell[1], *N Miguel Marco*[1], *X Sabater Gregori*[2], *A Esplugues Cebrián*[3]
[1]Rare Diseases Joint Research Unit, FISABIO-UVEG, FISABIO, Valencia, Spain
[2]Directorate General of Public Health, Generalitat Valenciana, Valencia, Spain
[3]Epidemiology and Environmental Health Joint Research Unit, FISABIO-UJI-UVEG, Valencia, Spain
Contact: cavero_cla@gva.es

Background:

Malignant mesothelioma is a rare type of cancer. The estimated incidence in Spain is 535 cases per year, being more frequent in men and reaching the highest rate of incidence between the ages of 60-70. Objective: to determine the characteristics of those affected by the mesothelioma in the Valencian Region during the period 2005-2016 and identify the temporary evolution.

Methods:

A cross-sectional study was performed. Cases were identified through the Valencian Region's Cancer Registry (VCR), those registered between 2005-2015 were identified by the ICD9-CM (code 163*) and 2016's by the ICD10 (code C45). Cases were validated through the review of clinical documentation. The incidence and mortality were calculated and a descriptive analysis was developed including clinical, demographic and social characteristics.

Results:

379 cases were identified and confirmed. 58.4% of the cases were men and the average age of diagnosis was 67 years. 85.1% were Spanish. 87.3% of cases had died and the average age of death was 70 years. An increasing incidence has been observed, being 11.4/1000000 inhabitants (CI95%:8.4-14.3) in 2016. The malignant mesothelioma morphology distribution was: 45.1% epithelial, 43.8% non-specified, 6.6% fibrous and 4.5% in two-phase. In 90.8% of the cases the assessment used to confirm the diagnosis was the primary tumour's histology, in 3.7% was a cytology or hematologic analysis, in 2.6% was metastatic tissue histology, in 1.3% were clinical signs, in 0.5% was other clinical test like MRI/CT scan, in 0.3% was a postmortem histology and in 0.8% assessment was unknown.

Conclusions:

The data about mesothelioma included in the VCR could be considered solid due to the results obtained through the validation. The mesothelioma's malignancy it is evident, despite its low incidence, its mortality rate is high. The increasing trend observed is in agreement with those experts who estimate that the highest rate of incidence will be between the years 2020-2040.

Key messages:

- The data about mesothelioma recorded in the Valencian Region's Cancer Registry could be considered solid due to the results obtained through the validation of information procedure.
- The increasing trend of malignant mesothelioma observed is in agreement with those experts who estimate that the highest rate of incidence will be between the years 2020-2040.

Impact of the Govan SHIP case management project on emergency hospital admission and GP interactions

Kate Levin

K Levin[1], *E Crighton*[1]
[1]Public Health Directorate, NHS GGC, Glasgow, UK
Contact: katyannlevin@gmail.com

Background:

The Social and Health Integration Partnership (SHIP) project was implemented in Govan, a deprived area in Glasgow in 2015. This involved multidisciplinary teams, including GPs and social workers, identifying and supporting vulnerable patients at risk of attending A&E and GP surgeries. This study measures the impact of SHIP on A&E presentations and GP interactions.

Methods:

Rate of A&E presentations per 1000 population in 3 participating GP practices in Govan was compared before and after onset of the service, using segmented linear regression with 9-month pre- and 36-month post- intervention periods. Rates of GP interactions were also compared, using 21-month pre- and 36-month post- intervention periods. Rates of A&E presentations and GP interactions for practice population in Drumchapel- an area with similar rates of deprivation - were used as a control. Models included autoregressive and moving average terms, and a fourier term to adjust for seasonality.

Results:

Govan had a lower rate of A&E presentations than Drumchapel. A&E presentations did not change significantly over time prior to SHIP in either area. At April 2015, SHIP onset, a level change of -4.34 (-7.44, -1.24) A&E presentations per 1000 was observed in both areas, however , onset of SHIP was not associated with a reduction in level or trend in A&E presentations. Rate of interactions with GP was greater in Govan than Drumchapel prior to SHIP, increasing over time in both areas. After SHIP implementation there was a significant level change of 33.78 (19.57, 47.99) per 1000 across both areas. GP interactions in Govan however saw a further reduction of -1.48 (-2.87, -0.09) per 1000 per month. This is equivalent to SHIP being associated with an absolute reduction of 37 GP interactions per thousand and a relative reduction of 7.2% by March 2018.

Conclusions:

The Govan SHIP initiative was associated with no significant change in A&E presentations and some small reduction in GP interactions.

Key messages:

- The Govan SHIP initiative was associated with no significant change in A&E presentations and a small significant reduction in GP interactions.
- A cost effectiveness analysis of the project is recommended, given the relatively small benefits observed.

Bringing greater transparency to health workforce planning in Tajikistan: using the WISN approach

Helen Prytherch

H Prytherch[1,2], Z Kasymova[1], F Lechthaler[4,1], S Kiefer[1,2], S Yarbaeva[1], Z Hojimatova[3], A Farrukhzoda[1], K Wyss[1]
[1]Swiss Centre for International Health, Swiss Tropical and Public Health Institute, Basel, Switzerland
[2]University of Basel, Basel, Switzerland
[3]Republican Clinical Centre for Family Medicine, Dushanbe, Tajikistan
[4]School of Agricultural, Forest and Food Sciences, Bern University of Applied Sciences, Bern, Switzerland
Contact: helen.prytherch@swisstph.ch

Background:

For many countries, overcoming problems related to human resources is critical for progress towards Universal Health Coverage. Planning the workforce means to make decisions on required number, qualification and distribution of health workers. In Tajikistan, despite significant reforms, the health workforce is unequally distributed with physicians being mainly specialized and concentrated in urban areas.

Description:

Using the Tajik case, we present a first comprehensive assessment of the Primary Health Care (PHC) staffing situation in a Central Asian setting applying and critically discussing the Workload Indicators of Staffing Need (WISN) method developed by the World Health Organization. Staffing requirements were derived using annual service statistics, obtained from a re-count of monthly routine data from registration books at facility level in the year 2016. Available health cadres in PHC at district and facility level were compared to the according staffing needs. Sensitivity analysis was performed to test the robustness of the predictions, and to identify the main contributors to uncertainty in the predicted staff requirements.

Results:

For doctors performing general tasks in the PHC, there is currently an excess of full time equivalents. Moreover, health centres are overstaffed in terms of nurse positions. If the various speciality doctors currently working at rural health centres are not included, there is a shortage of family doctors in place. Sensitivity analysis revealed that staffing requirements in the PHC sector in Tajikistan are most importantly influenced by antenatal care visits.

Lessons:

The present study concludes that there is an oversupply of doctors and nurses at PHC and a shortage of family doctors working at the level of health centres. Consequently, a more rational health workforce planning based on well-grounded methodology such as WISN has potential to contribute to more efficient and effective health service delivery in Tajikistan.

Key messages:

- Countries shifting towards a family medicine model face challenges like an oversupply of specialists performing general medical tasks and a lack of general/family doctors in the transition phase.
- To identify staffing requirements a transparent and reproducible approach, such as the WISN methodology, is required to steer future staffing needs and possible re-training of current staff.

8.H. Hospitals, public health and safety

Measuring organizational performance. A review of the dimensions of hospital performance indicators

Elettra Carini

E Carini[1], AM Pezzullo[1], EM Frisicale[1,2], P Cacciatore[1], A Di Pilla[1], A Grossi[1], I Gabutti[3], A Cicchetti[3], S Boccia[1,4], ML Specchia[1,4]
[1]Sezione di Igiene, Istituto di Sanità Pubblica, Università Cattolica del Sacro Cuore, Rome, Italy
[2]ASL Roma 1, Rome, Italy
[3]Alta Scuola di Economia e Management dei Sistemi Sanitari, Università Cattolica del Sacro Cuore, Rome, Italy
[4]Fondazione Policlinico Universitario A. Gemelli IRCCS, Rome, Italy
Contact: elettra.carini1@gmail.com

Patients' increasing needs and expectations demand for an overall assessment of hospital performances. Several Agencies described sets of performance indicators and there is not a unanimous classification. The ImpactHTA Horizon2020 Project wants to address this aspect, developing a toolkit of key indicators to measure hospital organizational performance. The aim of this review is to identify the dimensions of quality in which hospital performance indicators are grouped, and to assess if there has been an evolution over time of the above-mentioned dimensions.

Following the PRISMA statement, PubMed, Ovid and Web of Science databases were queried to perform an umbrella review. Articles focusing on secondary care settings, published January 2000-May 2018 were considered. The study design included was systematic review.

3680 records were screened and 6 systematic reviews ranging 2002-2014 were included. The following dimensions were described in at least 50% of the studies: 6 studies classified efficiency (53 indicators analyzed); 5 studies classified effectiveness (12 indicators), patient centeredness (10 indicators) and safety (8 indicators); 3 studies responsive governance (2 indicators), staff orientation (8 indicators) and timeliness (4 indicators). 3 reviews did not specify the indicators related to the dimensions listed, 1 gave a complete definition of the meaning of each dimension and related indicators.

The research shows steady awareness of the importance of patient centeredness, effectiveness, efficiency, and safety dimensions; apparently, there is still not much attention to sustainability, appropriateness and accessibility in terms of indicators measuring, although those dimensions are described in one of the latest review. Another review described a new dimension, resources and capacity, which focuses on the availability of new technologies, underlining the growing importance of the adoption of digitalization in healthcare.

Key messages:

- Main dimensions of performance indicators: efficiency, effectiveness, patient centeredness, safety.
- More emphasis to sustainability and appropriateness to align with today's healthcare challenges.

Healthcare costs and outcomes: a value-based assessment tool for Clinical Governance

Maria Lucia Specchia

ML Specchia[1,2], G Arcuri[1], A Di Pilla[2], G Ricciardi[2,3], R Bellantone[1]
[1]Direzione Governo Clinico, Fondazione Policlinico Universitario A. Gemelli IRCCS, Rome, Italy
[2]Sezione di Igiene, Istituto di Sanità Pubblica, Università Cattolica del Sacro Cuore, Rome, Italy
[3]Dipartimento Scienze Salute Donna, Bambino e Sanità Pubblica, Fondazione Policlinico Universitario A. Gemelli IRCCS, Rome, Italy
Contact: marialucia.specchia@unicatt.it

Issue/problem:

Health systems sustainability is a critical public health issue. A value-based approach is essential to improve patient-centeredness, appropriateness, quality and funding allocation in healthcare.

Description of the problem:

This project was aimed to develop an innovative transferable tool to assess value-based activities in Hospital by monitoring care pathways costs and outcomes. Main questions were to: assess cost and outcome variance in homogeneous groups of patients; evaluate clinical activities contribution to the hospital budget; identify and monitor critical points. In 2018 a Business Intelligence system fed by different Hospital datasets was developed and tested in a Teaching Hospital in Rome to quantify and integrate data on pathways efficacy and costs. It was based on an algorithm of 20 indicators related to Women and Child Care Pathways.

Results:

Preliminary results showed a great variance for the same intervention/procedure concerning length of stay (3-8 days), waiting times (1-4 days), innovative technologies costs (2000-6000€) and obsolete reimbursement rates (2000-5000€) that do not guarantee adequate economic contribution margins. Improvement actions were defined concerning pathways' workflow and organizational appropriateness. The need for negotiations with Ministry of Health was highlighted, aimed to update reimbursement rates.

Lessons:

The tool, built on a value-based process view, allowed analyzing online outcomes and costs data aggregated by path, benchmarking results, identifying critical issues and providing improvement solutions. It turned out to be an innovative methodology - also applicable in other settings/countries - to trigger changes in health management and pursue quality and efficiency in healthcare.

Key messages:

- Value-based healthcare is the new public health paradigm.
- Assessing simultaneously Hospital costs and outcomes is a valuable way to derive overall healthcare value, improve quality and rationalize resources allocation.

Development of the Austrian version of the Hospital Survey on Patient Safety Culture

Šehad Draganović

ŠD Draganović[1,2], GO Offermanns[1,2]
[1]Department of Human Resources, Leadership and Organization, University of Klagenfurt, Klagenfurt, Austria
[2]Institute for Hospital Organisation, Karl Landsteiner Society, Vienna, Austria
Contact: sehad.draganovic@aau.at

Background:

Patient safety culture in hospitals (PSC), as well as its measurement and development, have received plenty of attention in Europe in recent years. Several instruments have been developed for its measurement in European countries. As Austria does not have empirically reviewed questionnaires to measure PSC jet, the research question of this study was: Is the globally admitted American questionnaire "Hospital Survey on Patient Safety Culture (HSOPSC)" (Sorra & Nieva, 2004) suitable for the healthcare system in Austria?

Methods:

The HSOPSC contains 42 questions, which constituted twelve factors altogether. The pre-test was done with 101 health professionals. The online survey was conducted in ten public hospitals in 2017. Overall 1525 health professionals participated, which corresponded to a response rate of 23%. A new instrument, namely "Hospital Survey on Patient Safety Culture in Austria (HSPSC-AUT)", was developed using the Exploratory Factor Analysis (EFA) and the Confirmatory Analysis (CFA).

Results:

The factor structure of HSOPSC was not identical to the factor structure of HSPSC-AUT, developed in our study. The study showcased a new tool, HSPSC-AUT, with 30 items altogether, consisting of seven departmental factors, two hospital factors and one outcome factor. This new tool (HSPSC-AUT) showed pleasant results on the model, indicator, and construct level. The results of CFA for HSPSC-AUT ($\chi2$ [360] = 1408.245, p = 0.0001) showed a better model compared to HSOPSC. The absolute and relative fit-indices showed excellent model adjustment (RMSEA = 0.049, SRMR = 0.041, GFI = 0.927, CFI = 0.941, TLI = 0.929).

Conclusions:

The study presents a new instrument, HSPSC-AUT, for the measurement of PSC. According to the results, HSPSC-AUT (10-factor structure) has a better model fit than the original HSOPSC. This was confirmed by chi-square test, absolute and relative fit-indices, informational criteria, reliability, and construct validity.

Key messages:

- The development of an instrument for measuring safety culture is the first step leading to a better PSC. For this reason, HSPSC-AUT is recommended as an instrument to measure the PSC in Austria.
- Finally, it can be said that the development of a new questionnaire as well as the related measurements of validity and reliability have added value to science and practice.

Patient safety incidents in ambulatory care in Germany

Max Geraedts

M Geraedts[1], S Krause[1], M Schneider[1], J Leinert[2], W de Cruppé[1]
[1]Institute for Health Services Research and Clinical Epidemio, Philipps-Universitaet Marburg, Marburg, Germany
[2]Infas Institut fuer Angewandte Sozialwissenschaft GmbH, Bonn, Germany
Contact: geraedts@uni-marburg.de

Background:

In contrast to the inpatient sector, reliable data on the epidemiology and public health impact of patient safety incidents (PSI) are hardly found in the outpatient sector. Thus, this study focusses on the incidence of PSI; the distribution among the various specialist groups; the harmful consequences; the causes and how affected patients deal with PSI in Germany.

Methods:

We conducted a cross-sectional study using a newly developed computer-assisted-telephone-interview survey tool. Based on random telephone numbers, citizens >39 years were asked to report whether they had experienced a PSI in the last year or since their 40th birthday; whereby the PSI happened, what consequences the PSI had for them and if they reported the PSI back to their physician. We performed descriptive and multivariate analyses and extrapolated the results to the total population >39 years in Germany.

Results:

10037 citizens were surveyed (response rate 13%): 8841 had an outpatient visit last year, of whom 1570 (18%) had experienced at least one PSI. In total, 2832 PSI were reported. General practitioners caused 43% of PSI. Among specialists (54%), most PSI were found among orthopedists (15%) and internists (9%) and arose in connection with anamnesis and clinical examination (61%) as well as drug prescriptions (15%). 72% of the PSI caused health related harm. The most frequent harm was a deterioration in health (23%) and persistent pain (22%). 54% of those affected described the harm as severe or very severe. 27% considered doctors' stress and lack of time or poor communication (18%) as causes for PSI. 32% of PSI were reported back to the treating physician.

Discussion:

Extrapolated to the total population >39 years in Germany (47.2 million), an incidence of 12 million PSI per year must be expected with around 6.6 million affected outpatients. Thus, PSI in the outpatient sector are of immense public health importance in Germany.

Key messages:

- Patient safety incidents (PSI) often happen in the German outpatient sector.
- Outpatient PSI can also be accompanied by severe harm for patients.

The Bundle approach to reduce SSI rate of colon surgery, Piedmont (Italy): experience of 2012-2017

Alessandro Scacchi

A Scacchi[1], *A D'Ambrosio*[1], *E Rainero*[1], *C Vicentini*[1], *MF Furmenti*[1], *C Zotti*[1]

[1]Department of Public Health Sciences and Paediatrics, University of Turin, Turin, Italy

Contact: alessandro.scacchi@unito.it

Background:

According to ECDC, Surgical Site Infections (SSI) are the second most frequent type of Healthcare Associated Infections (HAI) in Europe and in USA, and 9.5% of colon surgical procedures develop SSI. SSIs are associated with prolonged hospital stay, higher costs burden and higher attributable morbidity and mortality. Interventional programs can reduce the risk of SSI. Care bundles are a complex of EBM-based interventions on a specific population and setting, in order to improve clinical outcomes. A bundle is successful only if all its items are properly applied, through the 'all-or-none' method. Application of a bundle does not exclude other good clinical practices.

Methods:

Data from 37 hospitals participating in the Regional SSI surveillance of Piedmont (Italy) were collected from 2012 to 2017. In hospitals applying the bundle, 4 bundle items had to be used in all the procedures: Temperature control, pre-operative shower, trichotomy, antimicrobial prophylaxis. 6909 patients undergoing colon surgery were followed for 30 post-operative days to detect SSI events (According to ECDC 2016 Protocol). For some procedures, compliance to Bundle item application was ≤ 75%.

Results:

6909 procedures were assessed: 3631 with no bundle application and 3278 with bundle application; in particular 974 were compliant to all bundle items (100%), while 2304 were compliant to 3 items or less (≤ 75%). We report a SSI risk of 11.20% for surgical procedures performed without bundle application; this risk decreases to 5.63% (OR: 0.49, 95% CI: 0,36-0,67; $p < 0.001$) when compliance to bundle is 100%. When compliance to bundle is ≤ 75% instead of 100%, SSI risk raises to 8.47% (OR: 1.49, 95% CI: 1.07-2.04; $p = 0.002$).

Conclusions:

Care bundle, if properly applied, is associated to statistically significant reduction of SSI rate (51%) for colon surgical procedures. Bundle programs should be encouraged and improved in hospitals to reduce healthcare costs and burden of HAIs.

Key messages:

- The use of the 4-item Surgical Care Bundle is associated to statistically significant reduction (51%) of SSI rate for colon surgical procedures.
- Surgical Care Bundle programs should be recommended and improved in every hospital to reduce healthcare costs and burden of HAIs.

Acute respiratory infection hospitalized in intensive care unit: long-term outcome in Elderly

Leslie Grammatico-Guillon

L Grammatico-Guillon[1,2], *C Hermetet*[1,2], *C Gaborit*[1], *L Laporte*[2,3], *A Guillon*[2,3,4]

[1]Regional Unit of Epidemiology, University Hospital of Tours, Tours, France
[2]Medical School, University of Tours, Tours, France
[3]Intensive Care Unit, University Hospital, Tours, France
[4]Inserm CEPR, University of Tours, Tours, France
Contact: leslie.guillon@univ-tours.fr

Background:

The consequences of the ageing population concerning ICU-hospitalization need to be adequately described, especially acute respiratory infections (ARI) strongly associated with Elderly. The study aimed to assess the long-term outcomes of ARI surviving ICU hospitalization in patients over 80 yo.

Methods:

A retrospective multicentre cohort study was performed, based on hospital discharge databases in one French region (2.5 million inhabitants). Patients with ARI in ICU were selected according to specific ICD-10 diagnosis codes recorded and matched with a control population (patient undergoing a cataract surgery), using a propensity score (matching algorithm 1:1 ratio, caliper 0.002) with the matching variables (age, sex, frailty score, chronic heart disease, chronic pulmonary disease and cancer). Analyzes of this matched population were performed to determine their 2-year in-hospital mortality, healthcare utilization and evolution of the frailty score during the 2-year period before/after the inclusion stay.

Results:

A total of 1,658 hospital stays for ARI after 80 yo were identified, with 438 dead (26%) during the initial stay. After matching with the cataract population, 988 patients were selected in each group without difference in the propensity score. ARI lead to an important increase of healthcare use during the 2 years after discharge. The patients that were discharged from hospital after ARI requiring ICU, had a 23-fold increase of death at 90 days and 4-fold at 2 years and the evolution of the frailty score was 1.6 fold higher than the cataract population.

Conclusions:

Elderly patients with severe ARI survived from their ICU stay in 75%, but have a major risk of death in the following months, and an important increase in healthcare consumption. Our findings provide data for more informed goals-of-care discussions and may help target post-ICU discharge services for these high-risk groups.

Key messages:

- Elderly patients with severe acute respiratory infection survived ICU in 75%, but had a major risk of death in the following months, added to a substantial increase in healthcare consumption.
- These findings provide data for more informed goals-of-care discussions and may help target interventions for these high-risk groups.

Obstetric interventions among native and migrant women: a survey of episiotomy in Portugal

Elsa Lorthe

E Lorthe[1], C Teixeira[1,2], T Rodrigues[1,3,4], H Barros[1,4]
[1]EPIUnit, Instituto de Saúde Pública, Universidade do Porto, Porto, Portugal
[2]Polytechnic Institute of Bragança, Bragança, Portugal
[3]Department of Gynecology and Obstetrics, S. João Hospital Center, Porto, Portugal
[4]Departamento de Ciências de Saúde Pública e Forenses, Faculdade de Medicina da Universidade do Porto, Porto, Portugal
Contact: elsa.lorthe@gmail.com

Introduction:

It is unclear whether migrant women experience worse pregnancy outcomes than native women. A better comprehension of obstetric care provision, including controversial interventions such as episiotomy, is important to improve equity of service provision, overall maternal and neonatal health and to support evidence-informed perinatal health policy-making. We aimed to determine if migrant and native women giving birth vaginally have different risks of episiotomy and if the risk differs by migrant sub-groups.

Methods:

This study is based on a cross-sectional survey of foreign-born women with a random sample of native women, implemented in 32 public maternity units in mainland Portugal. We included 3583 women with vaginal delivery. Migrant status was defined by the woman's country of birth (migrants, born abroad, vs natives, born in Portugal), then as subgroups of migrants from Brasil, Portuguese-speaking African countries (PSAC) and non Portuguese-speaking countries vs natives. The association between migrant status and episiotomy was assessed using multilevel logistic regression models, stratified by delivery mode, and adjusted for main risk factors of episiotomy.

Results:

The overall frequencies of episiotomy were 52.6% and 48.2% among the 1707 natives and the 1876 migrants, respectively (p = 0.01). With spontaneous delivery, migrant women had decreased odds of having an episiotomy (adjusted OR 0.70 [95% CI 0.58-0.83]), especially those from PSAC (aOR 0.57 [0.46-0.71]). However, with instrumental delivery, migrant women had increased odds of episiotomy (aOR 2.47 [95% CI 1.50-4.07]), especially those from Brasil (aOR 3.24 [1.18-8.92]) and non Portuguese-speaking countries (aOR 3.75 [1.82-7.71]).

Conclusions:

These results suggest non-medically justified differential care during childbirth and highlight the importance of developing evidence-based recommendations for episiotomy use, in a country with a high frequency of medical intervention during delivery.

Key messages:

- Portugal displays a high frequency of medical interventions during delivery, including episiotomy, highlighting the need for developing evidence-based recommendations.
- Migrant and native women have different risks of episiotomy, suggesting non-medically justified differential care.

Caesarean section and neonatal outcomes among women of migrant origin in Finland

Kalpana Bastola

K Bastola[1], P Koponen[2], M Gissler[3,4], T Kinnunen[1]
[1]Unit of Health Sciences, Tampere University, Tampere, Finland
[2]Department of Health, National Institute of Health and Welfare, Helsinki, Finland
[3]Department of Information Services, National Institute of Health and Welfare, Helsinki, Finland
[4]Department of Neurobiology, Karolinska Institute, Stockholm, Sweden
Contact: kalpana.bastola@tuni.fi

Background:

In Finland, limited information is available on neonatal disparities among migrant origin women. We investigated differences in caesarean section and neonatal outcomes between migrant and Finnish origin women in Finland.

Methods:

National data from the Medical Birth Register of Finland included information on the most recent singleton birth of all women (n = 382 233) between January 2004 and December 2014. We categorized women into nine regional categories based on their country of origin by linked population data from Statistics Finland. Women with Finnish origin were used as a reference group. Our main statistical method was logistic regression analyses adjusted for age, socio-economic status, pre-pregnancy body mass index, gestational age, parity, marital status, smoking during pregnancy, and ponderal index.

Results:

Compared with Finnish women, Sub-Saharan African women had higher odds for caesarean sections OR 2.14 (95% CI 1.96, 2.33), preterm births OR 1.22 (95% CI 1.0, 1.43), low 5 minutes Apgar score OR 3.73 (95% CI 3.09, 4.49), and intensive care unit care OR 1.39 (95% CI 1.24, 1.56) for newborns. South Asian and East Asian women were at increased risk for caesarean births OR 1.52 (95% CI 1.36, 1.71) and OR 1.19 (95% CI 1.10, 1.28) respectively, preterm birth OR 1.46 (95% CI 1.20, 1.77), and OR 1.28 (95% CI 1.13, 1.46) and low 5 minutes Apgar score OR 2.06 (95% CI 1.55, 2.76), and OR 1.36 (95% CI 1.11, 1.67) compared with Finnish women. Middle Eastern and Latin America/Caribbean women had higher odds for caesarean births OR 1.13 (95% CI 1.02, 1.24), and OR 1.66 (95% CI 1.39, 1.97) respectively and low 5 minutes Apgar score OR 1.69 (95% CI 1.34, 2.14) and OR 2.12, (95% CI 1.37, 3.26) compared with Finnish women.

Conclusions:

Groups of women with higher risk for caesarean section and poor neonatal outcomes were identified and they may need more attention in maternal and child health services.

Key messages:

- Women from Sub-Saharan African, East Asian and South Asian origin had an elevated risk for most of the poor obstetric outcomes compared with Finnish women.
- Women from East Asian and Russian/former USSR countries had lower risk for caesarean section and newborns care in intensive care unit compared with Finnish women.

8.I. Improving vaccine confidence: actions and outcomes

Misconceptions and lack of vaccine confidence: even First Responders are not spared

Matteo Riccò

M Riccò[1], L Vezzosi[2], F Balzarini[3], AG Mezzoiuso[3], L Veronesi[4], ME Colucci[4], C Signorelli[3]
[1]Dipartimento di Sanità Pubblica, Azienda USL di Reggio Emilia, Reggio Emilia, Italy
[2]Direzione Sanitaria, ASST di Cremona, Cremona, Italy
[3]Scuola di Specializzazione in Igiene e Sanità Pubblica, Università San Raffaele, Milan, Italy
[4]Dipartimento Medico Chirurgico, Università degli Studi di Parma, Parma, Italy
Contact: mricco2000@gmail.com

Introduction:

First Responders (FR) are front-line healthcare workers potentially exposed to different infectious agents. Characterizing their knowledge, attitudes and practices

(KAP) towards immunizations has therefore the potential to significantly improve occupational health and safety.

Methods:

A questionnaire-based cross-sectional study was performed during October 2018, collecting a convenience sample among FR from the Parma Province. Participants were inquired on 3 recommended vaccinations (i.e. seasonal influenza vaccine, SIV; measles vaccine, MeV; pertussis vaccine, Pa) and for meningococcal vaccines (MEN, not officially recommended in FR). Knowledge status (KS) and Risk Perception (RP) were assessed as percent values. Multivariate odds ratios (mOR) for factors associated with vaccination status were calculated by means of a binary logistic regression analysis.

Results:

A total of 161 questionnaires were retrieved (mean age 45.1±14.1 years; seniority 10.8 ± 8.6 years). Internal consistency was good (Cronbach's alpha = 0.894). KS was unsatisfying (46.5% ± 32.4) with uncertainties on the recommendations for MeV and MEN (39.1% and 34.2% incorrect answers). The majority of respondents were favorable towards MEN (89.4%), MeV (87.5%), Pa (83.0%), while 55.3% exhibited a favorable attitude for SIV, and 28.0% had received SIV 2018 (self-reported lifetime status for MEN 26.1%, MeV 42.2%, Pa 34.8%). RP was unsatisfying, particularly for SIV (33.9% ± 18.4). Interestingly enough, neither KS nor RP were associated with vaccination rates, being the main predictor for SIV 2018 a seniority ≥ 10 years (mOR 3.26, 95%CI 1.35-7.91), and higher educational achievements for both Pa (mOR 3.27, 95%CI 1.29-8.30) and MeV (mOR 2.69, 95%CI 1.09-6.65).

Conclusions:

Reasons for vaccination gaps in FR apparently do not find their roots only in FRs' incomplete KS or RP. However, the very low vaccination rates for SIV, MeV and Pa recommends stronger and more appropriate information campaigns.

Key messages:

- Main drivers of vaccination status in First Responders are not solely their knowledge status or risk perception.
- Achieving better vaccination rates in First Responders requires the understanding of a complex interplay of individual factors.

Compulsory vaccination policies: a systematic review about knowledge, attitudes and believes

Gianluca Voglino

G Voglino[1], MR Gualano[1], F Bert[1], E Olivero[1], M Corezzi[1], P Rossello[1], C Vicentini[1], R Siliquini[1]
[1]Department of Public Health Sciences, University of Torino, Torino, Italy
Contact: gianluca.voglino@unito.it

Background:

Vaccine hesitancy is a considerable issue in European Countries and leads to low coverage rates. Consequently, the implementation of national immunization programmes including the introduction of compulsory vaccination are required. It is interesting to determine citizens' knowledge, attitudes and believes about vaccination policies, in order to more effectively define vaccination programs.

Methods:

The present study systematically reviewed published studies evaluating attitudes towards mandatory vaccination programs. PubMed and Scopus scientific databases were searched and 4,198 results were returned, of these 29 met the inclusion criteria. PRISMA statements were followed.

Results:

Twenty-two studies assessed attitudes towards mandatory vaccination programs in general, while 9 papers focused specifically on the Human Papilloma Virus (HPV) vaccine. Most of the studies were performed in Europe and North America. According to the assessed studies, the majority of the population seems to be in favour of compulsory vaccinations, from 53% to 97% for different vaccination programs. More resistance has been recorded for the HPV vaccination: the percentage of agreement for mandatory HPV vaccinations ranged from 27% to 63.5%. Furthermore, some studies investigated healthcare workers' attitudes towards childhood and adult vaccinations. They pointed out that the general population is generally more in favour of mandatory vaccination policies than healthcare workers. The studies highlighted that the support to mandatory policies increased after their implementations.

Conclusions:

The results presented in this review could be an important starting point to further understand the issue of vaccine hesitancy and support the implementation of effective vaccination strategies in Europe.

Key messages:

- Mandatory vaccination policies are generally well accepted among general population.
- More resistance is recorded for specific vaccination (HPV) or among specific population (healthcare workers).

Opinions and beliefs in vaccine hesitant parents in Italy: what makes the difference

Sofia Zanovello

S Cocchio[1], C Bertoncello[1], M Fonzo[1], S Zanovello[1], SE Bennici[1], T Baldovin[1], A Buja[1], G Napoletano[2], F Russo[2], V Baldo[1]
[1]Hygiene and Public Health Unit, DCTV, University of Padova, Padova, Italy
[2]Servizio Promozione e Sviluppo Igiene e Sanità Pubblica, Direzione Prevenzione, Regione Veneto, Venezia, Italy
Contact: sofia.zanovello@studenti.unipd.it

Vaccine hesitancy has been defined as the delay of acceptance or refusal of vaccines. Hesitant parents' (HP) fluctuate between anti-vaccine (AP) and pro-vaccine parents' (PP) positions. In the light of alarming results from recent Eurobarometer 488, our aim was to identify sensitive topics harbouring the widest opinion gap between HP and PP.

In 2017, an online questionnaire was administered to parents with children aged 3-84 months. Parents were classified as PP, HP or AP based on self-reported vaccine status and timeliness of vaccinations. Agreement with 25 items was assessed with 5-point Likert scale. Items were combined into 8 topics (benefit/risk of vaccines, trust/mistrust in healthcare workers, administration policies, complacency, sense of community, freedom of choice) and scores calculated. Internal consistency was evaluated with Cronbach's α; t-tests (sig. <.05) were used (Norman G, 2018).

The study included 3,865 parents (64% PP; 32% HP; 4% AP). Cronbach's α ranged 0.77-0.92. The widest gap concerned the sense of community: HP (2.7/5.0) cared significantly less than PP (4.7) about the usefulness of vaccine in protecting other children and claimed for a complete freedom in decision to vaccinate (3.6) more than PP (1.8). HP were worried (4.1) about current vaccination schedule (PP 2.1): simultaneous administration and age at vaccination (considered too young) were matter of concern. Among HP, mistrust of healthcare workers (3.7) and fear of side effects (3.8) played an important role, but the gap with PP was narrower compared with abovementioned topics; awareness in vaccine benefits reached 3.7. Agreement with complacent attitudes was low (2.2) with the least difference with PP (1.2).

HP showed to partially consider benefits of vaccines on a community scale, claiming for a private nature of this choice. The existence of a consistent opinion gap about the vaccination schedule may suggest the need for a sharper focus on current communication tools and strategies.

Key messages:

- While hesitant parents share some concerns with pro-vaccine, relevant opinion gaps may serve as warning lights, pointing at topics potentially harbouring the most sensitive drivers of hesitancy.
- Communication strategies should primarily focus on raising acquaintance of hesitant parents with benefits arising from herd immunity and compliance with the suggested vaccination schedule.

Knowledge, false myths and beliefs on vaccines among pregnant women: results from NAVIDAD study

Maria Rosaria Gualano

MR Gualano[1], E Olivero[1], G Voglino[1], P Rossello[1], F Quattrocolo[1], F Bert[1], R Siliquini[1], Navidad Collaborating Group[2]
[1]Department of Public Health Sciences, University of Turin, Turin, Italy
[2]NAVIDAD, Collaborating Group, Italy, Italy
Contact: mariarosaria.gualano@unito.it

Background:

The diffusion of false myths and vaccine hesitancy are alarming phenomena in European countries and leads to decreasing trends in infant vaccine coverages. Aim of the study was to analyse the level of confidence and correct awareness about immunization, which are crucial for the success of vaccination programs.

Methods:

As part of the NAVIDAD multicentre study, we examined vaccination confidence and complacency, among a sample of 1820 pregnant women from 14 Italian cities. The questionnaire assessed the interviewee's knowledge, beliefs and misconceptions, as well as their socioeconomic status, sources of information about vaccines and confidence in the Italian National Healthcare Service.

Results:

Of the participants, only 9% of women completely believed to efficacy, necessity and safety of vaccinations. Almost 20% of them had misconceptions on the majority of the themes. There was a significant difference in level of knowledge considering educational level: women with a high educational level have less probability to obtain a low knowledge score (OR 0.43 [95%CI 0.34-0.54]). The level of knowledge was influenced also by the sources of information: women who got information from General Practitioner and from Institutional Web sites have significantly less chance to have misconceptions (OR 0.74 [95%CI 0.58-0.96]; OR 0.59 [95%CI 0.46-0.74]). Finally, results underlined the influence of trust in healthcare professional information on likelihood of having misconceptions (OR 0.49 [95%CI 0.27-0.89]).

Conclusions:

Data suggest the efficacy of healthcare professionals and Institutional Web sites as source of information to contrast misconceptions and underline the importance of confidence in the healthcare system to increase complacency and confidence on vaccines.

Key messages:

- There is a general lack of knowledge about vaccinations among future mothers. Most of misconceptions regarding vaccinations are related to their safety: this could affect confidence and complacency.
- To increase vaccine confidence, there is a strong need to inform future mothers: our data show the importance and efficacy of Health Professionals and Institutional Web sites as information sources.

The use of ICT to increase vaccination uptake: state of the evidence from experimental studies

Aurea Oradini Alacreu

A Odone, F Balzarini, B Frascella, A Oradini Alacreu, C Signorelli
[1]Università Vita-Salute San Raffaele Milano, Milan, Italy
Contact: oraauri@hotmail.com

Background:

Information and communication technology has a great potential to improve vaccine uptake by increasing the demand of vaccines and the supply of life-course immunization services. The EUVIS (EUrope Vaccines ICT Strategies) project aims at assessing the current use of ICT in European countries' immunization programs to inform the planning and implementation of ICT-based intervention models to increase vaccine uptake. Here we present the output of Part I of the EUVIS Project, the state of the evidence from experimental studies at the global and regional level.

Methods:

We conducted a systematic review following the PRISMA guidelines to analyze the available evidence from experimental studies on the impact of ICT-based interventions to improve: i) vaccine uptake (primary outcome), and other associated outcomes, including knowledge and attitudes towards immunization in infants, adolescents, adults, elder populations and at risk groups.

Results:

We included 68 RCTs. Informative websites significantly increased vaccination uptake among adolescents. Among young adults, none of the assessed interventions was successful in increasing vaccination uptake. The tools targeting parents that increased uptake were SMS, automated phone calls or messages, websites and online decision aid platforms. For pregnant women, combinations of more types of ICT were more effective in increasing uptake. In the adult population, both SMS and videos proved to be successful, while in elder populations and at-risk groups, the use of more traditional methods as short phone calls proved to be more efficient than ICTs.

Conclusions:

Technological innovations have made significant contributions to healthcare, but our results shows that the interventions must be tailored to target populations' specific characteristics and needs. These data are of crucial importance to identify which ICT-based interventions are more effective in each target group, to plan and implement immunization programs.

Key messages:

- Information and Communication Technology-based interventions to increase vaccine uptake are more successful when planned tailoring target populations' specific characteristics and needs.
- ICT can significantly improve healthcare delivery but its role to increase vaccine uptake is controversial. Results from this systematic review are fundamental to plan tailored ICT-based interventions.

Flu vaccination coverage in a large Italian teaching hospital: the example of the leaders

Marcello Di Pumpo

M Di Pumpo[1], A Barbara[1], D I La Milia[2], A Tamburrano[1], D Vallone[1], A Gentili[1], S Cavalieri[1], C Viora[1], F Berloco[2], P Laurenti[1,2]
[1]Sezione di Igiene – Istituto di Sanità Pubblica, Università Cattolica del Sacro Cuore, Rome, Italy
[2]Fondazione Policlinico Universitario Agostino Gemelli IRCCS, Rome, Italy
Contact: dipumpomarcello@gmail.com

Annual flu vaccination among healthcare workers (HCWs) is recommended to prevent influenza and to avoid its transmission especially to frail patients. In our teaching hospital, flu vaccination rate among HCWs has been growing during last 3 years. The aim of this study was therefore to describe the flu vaccination coverage across the past 3 years and to analyze which factors lead to such increase. We performed a cross-sectional study on all HCWs of Fondazione Policlinico Universitario ''A. Gemelli'' (FPG) hospital of Rome (Italy) to determine the flu vaccination coverage. Socio-demographic and occupational data were collected from hospital personnel records and included age, gender, previous flu vaccination, profession and workplace unit. On site vaccination plus academic detailing involving leaders have been the main strategies adopted in this last 3 years that have already proved to be effective in increasing vaccination coverage among HCWs. During the 2018-2019 season, we analyzed how the flu vaccination coverage among leaders (nurse coordinators and head physicians) could affect all HCWs coverage rate. Flu vaccination rate increased from 9.57% in the 2016-17 to 14.24% in the 2017-18 and to 22.38% in 2018-2019. A total of 4035 HCWs employed in the FPG were included in 2018-19. Concerning the role played by vaccination of leaders in increasing general vaccination coverage during the 2018-2019, the group of HCWs with a vaccinated leader showed a higher coverage rate (28.65%) than the group with a non-vaccinated leader (16.22%) ($p < 0.0001$). The results are preliminary. Flu vaccination coverage of HCWs in our hospital during the last 3 years has been increasingly higher. Vaccination of the leaders, in addition to previously implemented effective strategies, resulted to be a key factor in increasing flu vaccination coverage among all HCWs. Socio-demographic and occupational variables can significantly influence the coverage rate as well.

Key messages:

- Annual flu vaccination among healthcare workers (HCWs) is recommended to prevent influenza and to avoid its transmission especially to frail patients.
- This study shows the growing flu vaccination coverage rate in our teaching hospital and the effectiveness of the example given by the vaccinated leaders in increasing the coverage among all HCWs.

Vaccination apps: a missing opportunity from various perspectives?

Dario Catozzi

D Catozzi[1], *MR Gualano*[1], *O Kakaa*[1], *G Voglino*[1], *F Bert*[1,2], *R Siliquini*[1,2]
[1]Department of Public Health Sciences, University of Turin, Turin, Italy
[2]Molinette Hospital, AOU City of Health and Science of Turin, Turin, Italy
Contact: dario.catozzi@gmail.com

Introduction:

Apps for vaccination are rarely a topic in scientific literature, despite the growth of interest in mobile applications about physical exercise, food intake and even chronic diseases management. Since 2014 WHO is wishing and technically supporting the development of a pan-European vaccination app to overcome the trending vaccine hesitancy, and instituted this year a Department of Digital Health. This research aims to evaluate apps for general population, and parents in particular.

Methods:

We looked for apps from Google Play Store, the official Android store, searching single words related to vaccination with an Italian IP address, then exporting results. The research provided 1086 univocal apps that underwent a selection based on title, marketplace description and website if available, and further classified by category and other variables.

Results:

The 117 selected apps were downloaded 15 million times in total. The most common category is vaccination reminder and recorder (41% of apps with 2.4 mln downloads - DL), alone or as a part of a broad health manager, mostly designed for parents. The second one is medical education apps (35%, 343k DL) most of which in English and designed for healthcare professionals, then games (10.3% of apps but the most downloaded with 12 mln DL), appointment makers (7.7%, 122k DL) powered by Regional Healthcare Service, and vaccination travel managers (6%, 13k DL). Only 26.5% provided both description and app content in Italian.

Conclusions:

While literature states reminding apps may be a helpful resource to ease the completion of vaccinal duty, the n° of downloads shows a lack of interest or expose flaws in their features (e.g. absence of translation). This study also displays offer fragmentation regarding these new technological opportunities to raise vaccination awareness among peoples: neither a single Italian app is provided by the Ministry, nor a pan-European app by E.U., making WHO's wishes even more actual today.

Key messages:

- Vaccination reminder apps are a helpful but under-utilized tool for parents, maybe due to offer fragmentation, lack of translation and need of country adaptations.
- The creation of a centralized information service for mobile users is a challenge for European Digital Health in times of trending vaccine hesitancy.

An innovative continuing medical education approach of general practitioners on vaccination: ForMéVac

Marie-Christine Banide

C Guagliardo[1], *S Cortaredona*[2,3], *MC Banide*[4], *E Burlot*[4], *J Bouvenot*[4], *F Jozancy*[5], *P Verger*[1,2,3]

[2]Aix Marseille Univ, IRD, AP-HM, SSA, VITROME, Marseilles, France
[3]IHU-Méditerranée Infection, Marseilles, France
[4]DRSM Paca-Corse, Southeastern Regional Medical Department for Health Insurance, Marseilles, France
[5]URPS-ML Paca,Southeastern Regional Union of Private Practitioners, Marseilles, France
Contact: marie-christine.banide@assurance-maladie.fr

Background:

General practitioners (GPs) play a central role in vaccinating the population in France. In a context of mistrust regarding vaccination, and because patients increasingly question their GP about vaccines, we designed the continuing medical education (CME) module in order to 1) reinforce GPs knowledge about vaccination 2) help GPs answer questions most frequently asked by their patients and 3) evaluate the impact of this module on their vaccine prescriptions.

Methods:

The CME module lasted 3 hours and focused on MMR, meningitis C and seasonal influenza vaccines; GPs were given confidential feedback information on percentages of their patients vaccinated. We included GPs practicing in Southeastern France and with less than 60% of their child patients (aged between 10 and 34 months) with 2 reimbursements of MMR vaccines (data obtained from the Health Insurance Fund). Eligible GPs were then randomly assigned to three groups: those offered either a face-to-face or e-learning CME module and a control group without CME. We used vaccine reimbursement rates for MMR 2-doses, Meningitis C, seasonal influenza as proxies for vaccine prescription rates, and a difference in differences approach to compare reimbursement rates in the year before the CME session and in the 24 months post-intervention.

Results:

Compared to the control group, vaccine reimbursement rates for 2-dose MMR and meningitis C increased by 6% and 4% respectively ($p < 0.05$) among patients of GPs who participated in the face-to-face CME session (52 GPs, with 1 842 children). For seasonal influenza vaccine, we found a 12% increase in the face-to-face group ($p < 0.01$). We found no statistically significant increase in the e-learning group (19 GPs, with 674 children) whatever the vaccine.

Conclusions:

We found a modest impact of face-to-face CME session with feedback on GPs practices for childhood vaccines and a stronger one for seasonal influenza.

Key messages:

- The very positive feedback from face-to-face training highlights the fact that this type of training, which bring knowledge on vaccination in general and specific vaccines to GPs, is necessary.
- We found weak evidence for efficiency of CME sessions associated with audit/feedback to modify GPs practices regarding MMR and meningitis C vaccines.

8.K. Determinants of mental health

Income-related inequalities in mental health in Sweden and the role of social determinants

Sara Fritzell

S Fritzell[1,2], H Källberg[1], H Busch[1], P Gustafsson[3]
[1]Public Health Agency of Sweden, Solna, Sweden
[2]Karolinska Institutet, Solna, Sweden
[3]Umeå University, Umeå, Sweden
Contact: sara.fritzell@ki.se

Background:

Mental health is an increasing concern in all European countries as the burden of mental disorders continue to grow and cause substantial suffering and costs to societies. Furthermore, research shows there are social inequalities in the distribution of mental illness. This study aims to increase knowledge on income-related inequalities in mental health in Sweden and the role of social determinants.

Methods:

Drawing on a national survey (Health on Equal Terms) representative of the population aged 16-84, years 2010-2015 (n = 57107) we quantify the income-related inequality in mental health and estimate the contribution of social determinants of the inequality. Poor mental health is defined as a value of at least 3, based on the general health questionnaire (GHQ)-12. Income is measured as yearly disposable income. Income related inequalities in mental health are quantified by the concentration index and decomposed using the Wagstaff-type decomposition analysis.

Results:

Preliminary results show that the income inequalities in mental health, as measured by the overall concentration index in mental health was - 0,16 (95% CI -0.17 to -0.15), indicating income inequalities to the disadvantage of those less affluent. The determinants that contributed most to the inequalities were employment, financial strain and experiencing harassment. Together they explained 43 % of the income inequalities in mental health. Generally, socio-economic factors had highest importance for the inequalities found, while demographic factors and psychosocial factors were of smaller importance.

Conclusions:

The income related inequalities in mental health are substantial in Sweden. Recently, a national target of reducing the preventable inequalities in health within a generation was adopted. To improve surveillance of inequalities and inform policy we need to closely follow the development of inequalities in mental health and to disentangle the contribution of specific social determinants.

Key messages:

- Income-related inequalities in mental health in Sweden are considerable.
- Socio-economic factors had highest importance for the inequalities found, while demographic factors and psychosocial factors were of smaller importance.

Child living arrangements following separation and mental health of parents in Sweden

Sara Fritzell

S Fritzell[1], M Gähler[2], E Fransson[2]
[1]Karolinska Institutet, Solna, Sweden
[2]Stockholm University, Stockholm, Sweden
Contact: sara.fritzell@ki.se

Background:

Father involvement and joint physical custody in post-separation families have become increasingly common. In Sweden, 35 percent of the children of separated parents live equally much with both parents. The associations between child living arrangement and parental health may vary between women and men. This study analyzes the association between children's living arrangement and mental health of parents, and how this interacts with material and social circumstances.

Methods:

Drawing on The Swedish Survey of Living Conditions (ULF) 2008-2013, the association between child living arrangements and mental health (worry/anxiety) of parents in four family structures: nuclear, reconstituted, single with joint physical custody, and single with main or sole custody, were analyzed. Data on 9,225 mothers and fathers with resident children aged 0-17 were analyzed by logistic regressions for average marginal effects adjusting for socio-demographic, socio-economic and social factors. Analyses of interaction effects were made using the synergy index.

Results:

Substantial family type differences were found in mental health between nuclear family and all other family types for mothers, and nuclear family and single parents for fathers. For the single mothers, the higher risk for worry and anxiety was reduced following controls for socioeconomic factors. Interaction effects were found for the combination of single motherhood and non-employment, causing a higher risk of mental health problems for single mothers, both with joint (SI 5.25 (2.06-13.39)) and sole custody (SI 1.70 (1.11-2.62)), than would be expected from a simple addition of these exposures, indicating that this is a vulnerable group.

Conclusions:

The results indicate that joint custody is associated with higher risk for worry and anxiety for the parents, especially for mothers, both re-partnered and single, but also for single fathers.

Key messages:

- Shared residence is associated with higher risk for worry and anxiety in parents.
- Single mothers lacking employment is a particularly vulnerable group.

The assessment of students anxiety and depression symptoms, sense of coherence and suicidal risk

Giedrė Žulpaitė

G Žulpaitė[1], E Žilinskas[1], K Puteikis[1], M Jakubauskienė[1]
[1]Vilnius University, Vilnius, Lithuania
Contact: giedrezulpaite@gmail.com

Background:

The study measures and compares the rates of anxiety, depression, sense of coherence, subjective health status, suicidal risk among students from 12 universities of Lithuania.

Methods:

Six-hundred-fifty-eight students from different academic fields completed a questionnaire that consisted of 23 questions and included Hospital Anxiety and Depression(HAD), Sence of Coherence(SOC-3) scales, suicide risk and subjective health status assessments. The data was analised by Microsoft Excel, R commander and IBM SPSS programmes.

Results:

Males had higher depression($p = 0,025$), but lower anxiety prevalence($p < 0,001$) than females. The total score of depression symptoms subscale (5,min = 0,max = 19) indicated no risk of depression, although a mild anxiety level was found (the total score is 10,min = 0,max = 21). Students scored 3 points out of 6 in SOC-3 and evaluated their health for 2 points out of 5. Weak suicide risk was found in 43,2%(n = 284) of all respondents, moderate - 12%(n = 79) and high - 3,2%(n = 21). Students from the field of arts had the highest depression rate(7), whereas those from social sciences had the lowest rate(3)($p < 0,001$). Students who live alone during years of study evaluated their health the worst($p = 0,004$), had higher risk of depression($p = 0,038$), more often felt sadness and apathy during the last 12 months($p = 0,045$).

Conclusions:

The respondents have mild anxiety symptoms, low sence of coherence, their subjective health status is good. More than half of students had suicidal thoughts. Male gender, academical field of arts, living alone during studies potentially increase the risk of depression, whereas female gender is related with higher anxiety symptoms. This study motivates the universities of Lithuania to strengthen the psychological support for students.

Key messages:

- The survey unveiled the need for higher education institutes to put more effort on reducing students‘ anxiety levels and it also highlighted the problem of suicide ideation among students.
- This study motivates the main universities of Lithuania to strengthen the psychological support for students.

Development of the guideline ‘Challenging behaviour in adults with intellectual disability’

Marieke Kroezen

M Kroezen[1,2]*, P Embregts*[2]*, E Mulder*[3]*, C Van Bussel*[6]*, J Van der Nagel*[4]*, N Van den Akker*[1]*, R Wolkorte*[1,2]*, J Wieland*[5]

[1]Department of General Practice, Erasmus University Medical Centre, Rotterdam, Netherlands

[2]Academic Collaborative Center Living with an ID, Tilburg University, Tilburg, Netherlands

[3]Centre for Intellectual Disabilities and Mental Health, GGZ Drenthe, Assen, Netherlands

[4]Tactus Addiction Medicine, Tactus, Enschede, Netherlands

[5]Expertise center mild intellectual disability+, Cordaan, Amsterdam, Netherlands

[6]Centre for Consultation and Expertise, CCE, Utrecht, Netherlands

Contact: m.kroezen@erasmusmc.nl

Background:

Challenging Behaviour (CB) is a common problem among people with intellectual disability (ID), leading to a lower quality of life and a negative impact on the emotional well-being of family, staff and fellow clients. Additionally, reduced access to community services and (avoidable) high consumption of specialist care has been reported. This presentation will offer information on the development and content of the Dutch multidisciplinary guideline ‘Challenging behaviour in adults with ID’ that will be published in 2019.

Methods:

The guideline was developed on the basis of the methodologic strategy of the AGREE II instrument. Two systematic reviews were conducted. Additionally, healthcare professionals were surveyed through an online questionnaire, interviews (n = 14) and focus groups (n = 6), and interviews were conducted with adults with ID (n = 20) and their family (n = 16). The draft guideline was reviewed by stakeholders and underwent a practice test.

Results:

The first module of the guideline describes the assessment of (1) the CB itself, (2) potential factors that contribute to the presence or continuation of CB, and (3) the context in which CB occurs. Implementation will lead to a comprehensive, integrated diagnosis and assessment of the CB, the person and context.

Module 2 enables health professionals to systematically and transparently select and apply interventions to resolve CB, whilst taking into account multiple factors as well as the specific context in which the CB occurs.

Module 3 provides the medical, legal and ethical framework for (off-label) prescription of psychotropics. It explains the process for starting and discontinuing (off-label) psychotropics, the selection of appropriate medication and dosages, and the monitoring and evaluation of effects and side-effects.

Conclusions:

The guideline is based on state of the art scientific and practice-based evidence and will contribute to a more structured approach in the care for people with ID and CB.

Key messages:

- Challenging behaviour is a common problem among people with intellectual disability and can have a negative impact on quality of life and the emotional well-being of family, staff and fellow clients.
- The development of the multidisciplinary guideline ‘Challenging behaviour in adults with ID’ can help to better understand and treat challenging behaviour in people with ID.

The impact of a national public awareness campaign on dementia knowledge and help-seeking in Ireland

Desmond Hickey

D Hickey[1]*, RW Glynn*[1]*, E Shelley*[2]*, B Lawlor*[3]

[1]Department of Public Health, Health Service Executive East, Dublin, Ireland

[2]Faculty of Public Health Medicine, Royal College of Physicians of Ireland, Dublin, Ireland

[3]Department of Psychiatry, St. James’s Hospital, Dublin, Ireland

Contact: desmond.hickey@ucdconnect.ie

Background:

Dementia is a growing public health issue in Ireland primarily due to the ageing population. Increasing public knowledge of dementia has been identified as a key priority to reduce disease burden. This study evaluated the impact of a dementia communication campaign on dementia knowledge and help-seeking intention among the general public in Ireland.

Methods:

In 2016, a nationally-representative sample of over 1,200 adults in Ireland was surveyed to inform a nationwide dementia awareness campaign entitled Understand Together. Multiple factors were examined including sociodemographic characteristics, dementia advertising awareness, dementia knowledge and help-seeking intention. A similar survey (N = 1,003) was conducted in 2018 to evaluate public awareness of the campaign and its association with dementia knowledge and help-seeking intention. Data from the 2016 and 2018 surveys were analysed using univariable analysis and logistic regression, adjusted for sociodemographics.

Results:

Awareness of dementia advertising increased from 17% (2016) to 32% (2018) ($p < 0.001$). Women (OR 1.51, 95%CI 1.14-2.00), rural residents (OR 1.48, 95%CI 1.10-2.00), respondents aged 40-59 years (OR 1.96, 95%CI 1.40-2.74) or 60+ years (OR 2.18, 95%CI 1.47-3.22), and those who knew someone with dementia (OR 2.06, 95%CI 1.55-2.75) were more likely to be aware of the campaign. Very good or good dementia knowledge and awareness that dementia risk is modifiable increased from 24% to 33% ($p < 0.05$) and 46% to 52% ($p < 0.05$), respectively. There was a linear association between campaign awareness and both help-seeking (OR 1.81, 95%CI 1.36-2.40) and holding a positive view of the potential benefits of early diagnosis (OR 1.97, 95%CI 1.35-2.88).

Conclusions:

The ongoing campaign, as well as future communication strategies, should continue to focus on increasing awareness of modifiable risk to support prevention. Campaign messaging/modalities should be targeted at harder to reach population groups.

Key messages:

- Public communication on dementia can improve knowledge and help-seeking.
- Health communication campaign evaluation can identify, and inform the targeting of, hard to reach population groups.

8.L. Population health patterns

The decomposition of life expectancy for age and cause of death in Tuscany, Italy

Francesco Gori

N Nante[1,2], *L Kundisova*[2], *F Gori*[2], *A Martini*[3], *F Battisti*[3], *L Giovannetti*[3], *G Messina*[1,2], *E Chellini*[3]

[1]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
[2]Department of Molecular and Developmental Medicine, Post Graduate School of Public Health, Siena, Italy
[3]Institute for Study, Prevention and Cancer Network, Florence, Italy
Contact: francescogori24@gmail.com

Introduction:

Changing of life expectancy at birth (LE) over time reflects variations of mortality rates of a certain population. Italy is amongst the countries with the highest LE, Tuscany ranks fifth at the national level. The aim of the present work was to evaluate the impact of various causes of death in different age groups on the change in LE in the Tuscany region (Italy) during period 1987-2015.

Material and methods:

Mortality data relative to residents that died during the period between 1987/1989 and 2013/2015 were provided by the Tuscan Regional Mortality Registry. The causes of death taken into consideration were cardiovascular (CVS), respiratory (RESP) and infective (INF) diseases and cancer (TUM). The decomposition of LE gain was realized with software Epidat, using the Pollard's method.

Results:

The overall LE gain during the period between two three-years periods was 6.7 years for males, with a major gain between 65-89, and 4.5 years for females, mainly improved between 75-89, <1 year for both sexes. The major gain (2.6 years) was attributable to the reduction of mortality for CVS, followed by TUM (1.76 in males and 0.83 in females) and RESP (0.4 in males; 0.1 in females). The major loss of years of LE was attributable to INF (-0.15 in females; -0.07 in males) and lung cancer in females (-0.13), for which the opposite result was observed for males (gain of 0.62 years of LE).

Conclusions:

During the study period (1987-2015) the gain in LE was major for males. To the reduction of mortality for CVS have contributed to the tempestuous treatment of acute CVS events and secondary CVS prevention. For TUM the result is attributable to the adherence of population to oncologic screening programmes. The excess of mortality for INF that lead to the loss of LE can be attributed to the passage from ICD-9 to ICD-10 in 2003 (higher sensibility of ICD-10) and to the diffusion of multi-drug resistant bacteria, which lead to elevated mortality in these years.

Key messages:

- The gain in LE during the period the 1987-2015 was higher in males.
- The major contribution to gain in LE was due to a reduction of mortality for CVS diseases.

Domain-specific physical activity patterns and cardiorespiratory fitness among adults in Germany

Johannes Zeiher

J Zeiher[1], *M Duch*[1,2], *LE Kroll*[3,1], *GBM Mensink*[1], *JD Finger*[1], *T Keil*[4,5,6,2]

[1]Department of Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
[2]Department of Sports and Health Sciences, University of Potsdam, Potsdam, Germany
[3]Central Research Institute of Ambulatory Health Care in Germ, Central Research Institute of Ambulatory Health Care in Germany, Berlin, Germany
[4]Institute for Health Resort Medicine and Health Promotion, Bavarian Health and Food Safety Authority, Bad Kissingen, Germany
[5]Institute for Clinical Epidemiology and Biometry, University of Würzburg, Würzburg, Germany
[6]Institute for Social Medicine, Epidemiology and Health Econo, Charité Universitätsmedizin Berlin, Berlin, Germany
Contact: zeiherj@rki.de

Background:

Studies show that occupational physical activity (OPA) has less health-enhancing effects than leisure-time physical activity (LTPA). The spare data available suggests that OPA rarely includes aerobic PAs with little or no enhancing effects on cardiorespiratory fitness (CRF) as a possible explanation. This study aims to investigate the associations between patterns of OPA and LTPA and CRF among adults in Germany.

Methods:

1,204 men and 1,303 women (18-64 years), who participated in the German Health Interview and Examination Survey 2008-2011, completed a standardized sub-maximal cycle ergometer test to estimate maximal oxygen consumption (VO2max). Job positions were coded according to the level of physical effort to construct an occupational PA index and categorized as low vs. high OPA. LTPA was assessed via questionnaires and dichotomized in no vs. any LTPA participation. A combined LTPA/OPA variable was used (high OPA/ LTPA, low OPA/LTPA, high OPA/no LTPA, low OPA/no LTPA). Information on potential confounders was obtained via questionnaires (e.g., smoking and education) or physical measurements (e.g., waist circumference). Multi-variable logistic regression was used to analyze associations between OPA/LTPA patterns and VO2max.

Results:

Preliminary analyses showed that less-active men were more likely to have a low VO2max with odds ratios (ORs) of 0.80 for low OPA/LTPA, 1.84 for high OPA/no LTPA and 3.46 for low OPA/ no LTPA compared to high OPA/LTPA. The corresponding ORs for women were 1.11 for low OPA/LTPA, 3.99 for high OPA/no LTPA and 2.44 for low OPA/no LTPA, indicating the highest likelihood of low fitness for women working in physically demanding jobs and not engaging in LTPA.

Conclusions:

Findings confirm a strong association between LTPA and CRF and suggest an interaction between OPA and LTPA patterns on CRF within the workforce in Germany. Women without LTPA are at high risk of having a low CRF, especially if they work in physically demanding jobs.

Key messages:

- Women not practicing leisure-time physical activity are at risk of having a low cardiorespiratory fitness, especially if they work in physically demanding jobs.
- Different impact of domains of physical activity should be considered when planning interventions to enhance fitness among the adult population.

Cognitive function and type of physical activity: results from the FRéLE longitudinal study

Caroline Dupré

C Dupré[1,4], *D Hupin*[2], *C Goumou*[1], *F Béland*[3], *F Roche*[2], *T Célarier*[5], *B Bongue*[1,2,4]

[1]CETAF, CETAF, Saint-Etienne, France
[2]Laboratoire SNA-EPIS EA 4607, Université Jean Monnet Saint-Etienne, Saint-Etienne, France
[3]Département de Médecine Gériatrique, Université Mc Gill, Montréal, Canada
[4]Chaire Santé des Ainés et Ingénierie de Prévention, Université Jean Monnet Saint-Etienne, Saint-Etienne, France
[5]Service de Gérontologie, Hopital Nord - CHU, Saint-Etienne, France
Contact: caroline.dupre@cetaf.fr

Background:

Previous cohorts have been notably criticized for not studying the different type of physical activity and not investigating household activities. The objective of this work was to analyse the relation between physical activity and cognitive decline in older people living in community. Impact of type of physical activity on the results has been realised.

Methods:

The study used data from the longitudinal and observational study , FrèLE (FRagility: Longitudinal Study of Expressions). The collected data included: socio-demographic variables, lifestyle, and health status (frailty, comorbidities, cognitive status, depression). Cognitive decline was assessed by using: MMSE (Mini-Mental State Examination)and MoCA (Montreal Cognitive Assessment). Physical activity was assessed by the PASE (Physical Activity Scale for the Elderly). This tool is structured in three sections: the leisure activity, the domestic activity and the professional activity. Logistic regressions and proportional hazards regression models (Cox) were used to estimate the risk of cognitive disorders.

Results:

At baseline, the prevalence of cognitive disorders was 6.9% according to MMSE. In total, 1326 participants without cognitive disorders were included in the analysis. The mean age was 77.4 years, and 52.1% of the participants were women. After a 2 years long follow-up, we found cognitive disorders on 92 participants (6.9%). Physical activity at baseline is lower in older adults for whom cognitive decline was observed after two years of follow-up. Subclass analyses showed that leisure and domestic activities were associated to cognitive decline, but not professional activities.

Conclusions:

Analysis showed a relationship between cognitive disorders and type of physical activity. The current study will be completed by the MoCA for mild cognitive impairment. These findings compared to other ongoing studies will contribute to the debate on the beneficial effects of physical activity on cognition.

Key messages:

- The work allowed us to analyze the link between the different types of physical activity and mild to severe cognitive disorders. The aim is to put in place preventive policies of aging.
- The work allowed us to see the effect of the different types of physical activity and the impact of the statistical method on the results.

Monitoring of obesity in the Italian adult population: preliminary results of 1998-2018 trend

Chiara Donfrancesco

C Donfrancesco[1], *C Lo Noce*[1], *E Profumo*[1], *D Minutoli*[1], *A Di Lonardo*[1], *B Buttari*[1], *P Bellisario*[2], *D Vanuzzo*[3], *S Giampaoli*[1], *L Palmieri*[1]
[1]Cardiovascular, Endocrine-metabolic Diseases and Aging, Istituto Superiore di Sanità, Rome, Italy
[2]Italian Ministry of Health, Rome, Italy
[3]Associazione Nazionale Medici Cardiologi Ospedalieri (ANMCO), Florence, Italy
Contact: chiara.donfrancesco@iss.it

Background:

Obesity is a risk factor for the majority of non-communicable diseases-NCDs. In the Italian country profile, the NCD Risk Factor Collaboration estimated the 2010 obesity prevalence at 19.0% (95% confidence interval - C.I. 15.7-22.7) in women aged 18 years and over and 18.5% (95% C.I. 15.1-22.0) in men, with a very low probability (2-9%) of halting the increase of obesity by 2025 (WHO global obesity target). This preliminary analysis aims to assess 20 years trend of BMI and obesity in the Italian general adult population using the data collected within the CUORE Project.

Methods:

Mean of BMI and prevalence of obesity (BMI > = 30 kg/m2) in random samples of resident population in 6 Italian Regions, aged 35-74 years, stratified by age and sex, were assessed in an on-going survey started in 2018 (men 612; women 649), and compared to those assessed in the same Regions in 1998-2002 (men 1933, women 1926) and in 2008-2012 (men 1306; women 1318). Weight and height were measured using standardized methodologies. Surveys were partly funded by the Italian Ministry of Health-CCM and approved by the National Institute of Health ethical committee.

Results:

In men, mean values of BMI resulted 26.6 kg/m2 (95% C.I. 26.4-26.8) in 1998 survey, 27.5 (27.2-27.7) in 2008 and 26.5 (26.1-26.8) in 2018; prevalence of obesity was 16.8% (95% C.I. 15.1-18.4) in 1998, 23.5% (21.2-25.8) in 2008 and 17.3% (14.4-20.4) in 2018. In women mean values of BMI were 26.1 kg/m2 (95% C.I.: 25.9-26.4) in 1998, 26.4 (26.1-26.7) in 2008 and 25.5 (25.1-25.9) in 2018; prevalence of obesity was 20.7% (95% C.I.: 18.9-22.5), 21.9% (19.7-24.2) and 19.0% (15.9-22.0) respectively.

Conclusions:

Preliminary data of first 6 Regions (out of 10 to be examined in the on-going survey) suggest that mean BMI and prevalence of obesity in Italian adult population are still very high; if confirmed, in the last ten years a reduction seems to be occurred increasing the probability of meeting the WHO obesity target by 2025.

Key messages:

- Mean BMI and prevalence of obesity in Italian adult population are still high.
- If confirmed, in the last ten years a reduction of mean BMI and prevalence of obesity in Italian adult population seems to be occurred.

Trends in the co-occurrence of cardiovascular risk factors by education in Finland, 1997–2017

Laura Paalanen

L Paalanen[1], *T Härkänen*[1], *J Kontto*[1], *H Tolonen*[1]
[1]Department of Public Health Solutions, National Institute for Health and Welfare, Helsinki, Finland
Contact: laura.paalanen@thl.fi

Background:

Understanding on sociodemographic variation of the co-occurrence of cardiovascular disease (CVD) risk factors is crucial for planning public health policy and future prevention strategies. We aimed at examining 1) the co-occurrence of smoking, hypertension, elevated cholesterol and obesity by education, and 2) the trends in educational differences in the co-occurrence of these risk factors in Finland.

Methods:

We used cross-sectional health examination surveys carried out every five years among the general adult population: for 1997-2012 the National FINRISK Study and for 2017 the FinHealth 2017 Survey. Respondents aged 25-64 years were included in the analyses (n = 25,036). Current smoking, obesity (BMI$\geq$30 kg/m2), hypertension ($\geq$140/$\geq$90 mmHg or medication) and elevated serum total cholesterol ($\geq$5.0 mmol/l or medication) were used for the risk factor accumulation score with categories 1) zero, 2) one, 3) two, and 4) three or four elevated risk factors. Multinomial logistic regression was used to estimate predicted probabilities for each category.

Results:

Overall, the risk factor score was more favourable among women than men, and among high education groups than low education groups in both sexes. The lowest risk factor score class became more prevalent in all education groups in both sexes over time. The change in educational differences was not significant. However, the intermediate education group approached the highest education group over time.

Conclusions:

Our data indicate an overall transition towards a more favourable risk factor score in Finland, in 1997-2017. The score among the intermediate education group approached that among the highest education group. The tendency of risk factor accumulation among those with least education remained during the study period, which raises a need to develop and implement interventions and public health policies that would be effective in decreasing the risk factor burden particularly in this group.

Key messages:

- Overall, a favourable trend of diminishing risk factor prevalence was seen.

- The tendency of accumulation of major CVD risk factors among the least educated subjects remained from 1997 to 2017.

Variants in Neuromedin U pathway genes and risk of cardiovascular disease in an Italian population

Francesco Gianfagna

F Gianfagna[1,2], A Marotta[3], F Noro[3], A Gialluisi[3], B Izzi[3], S Costanzo[3], A Di Castelnuovo[1], C Cerletti[3], MB Donati[3], L Iacoviello, on behalf of Moli-Sani Study Investigators
[1]Mediterranea Cardiocentro, Naples, Italy
[2]EPIMED Research Center, Department of Medicine and Surgery, University of Insubria, Varese, Italy
[3]Department of Epidemiology and Prevention, IRCCS Neuromed, Pozzilli, Italy
Contact: francesco.gianfagna@uninsubria.it

Background:

Neuromedin U (NMU) is a hypothalamic neuropeptide with several functions, considered to be a potential therapeutic target for diabetes mellitus. The aim of this study was to analyse the association between genetic variants in NMU pathway genes and cardiovascular risk, in Italian adults from the general population recruited for the Moli-sani study.

Methods:

A total of 4,039 participants (mean age 55.8±12.1 SD; men 46.1%) were randomly selected from the whole study population (N = 24,325; recruitment years 2005-2010). DNA from blood samples stored in the Moli-sani biobank were genotyped for 14 single nucleotide polymorphisms (SNPs) in the genes encoding for NMU, Neuromedin S (NMS) and their receptors NMUR1 and NMUR2. Cox regression analysis (age, sex, BMI, blood pressure, glucose and lipid levels as covariates) was performed to estimate the associations between SNPs and fatal or non-fatal CVD events (validated myocardial infarction or stroke), identified from death certificates and electronic records during a median follow-up of 4.5 years. A genetic score was then computed.

Results:

CVD events (N = 93) were associated with mutant alleles in the NMU SNP rs55796004 (HR = 1.94; 95%CI:1.08-3.48) and rs4856020 (HR = 0.52; 95%CI: 0.29-0.94) and in the NMS SNP rs12474526 (HR = 0.48, 95%CI:0.28-0.81), independently from CVD risk factors. A SNP in NMUR1 showed a borderline association (rs6754952, HR = 0.74; 95%CI:0.54-1.00). The derived genetic score was associated with CVD incidence with a HR of 1.57 (95%CI:1.25-1.96, per 1 score SD). A HR of 7.33 (95%CI:1.68-32.01) was found comparing the last vs the 1st decile of the genetic score.

Conclusions:

Italian adults carrying variants in NMU pathway genes are at increased CVD risk. Intermediate phenotypes, mediating this association independent of classical risk factors, are unknown and should be investigated. Once confirmed, these results could be useful to improve CVD risk assessment and to plan cost-effective interventions.

Key messages:

- Polymorphisms in NMU pathway genes are associated with CVD risk independently of classical CVD risk factors, suggesting a potential clinical utility in CVD prediction when added to CVD risk algorithms.
- The unknown phenotype mediating the association between NMU genes polymorphisms and CVD development could be the neglected CVD risk factor potentially explaining the unpredicted CVD fraction.

8.M. Interventions to change behaviours

Effects of a behavioural approach on lifestyle habits: a before-after interventional study

Emilia Guberti

E Guberti[1], P Navacchia[1], R Marzocchi[1], G Bonaccorsi[2], G Cavallo[2], C Lorini[2]
[1]Food and Nutrition Service, Azienda USL of Bologna-Public Health, Bologna, Italy
[2]Dipartimento Scienza della Salute, Università di Firenze, Florence, Italy
Contact: emilia.guberti@ausl.bologna.it

The study aimed to offer a path of empowerment to promote adherence to healthy diets and physical activity for cancer prevention,according to the recommendations of the World Cancer Research Fund (2007): 5 servings per day of fruit / vegetables, protective food (EVO, green tea, cruciferous, turmeric, dried fruit), practicing at least 30 minutes of moderate physical activity.

Participants were volunteers between 18 - 70 years old divided in groups of 25/30 people. They followed a course of 7 theoretical and practical meetings (lifestyles, resilience and cooking workshops) and they signed a contract to comply with the promoted habits, which were verified through questionnaires administered during the engagement phase (T0), three months after the beginning of the course (T1) and one year after (T2).

Six editions (2014-2017) were made for a total of 153 subjects involved (75% women, average age 54 years old). Of these, 116 eligible subjects (76%) were also evaluated at T1 and 63 volunteers (41.7%) at T2. With respect to the dropped out rate, 24% of the subjects left the study prior T1, while 45% of volunteers left it prior T2. The established goal (40% expected target) was accomplished and excided the expectation, since more than 80% of the subjects involved at T1 achieved an improvement in healthy diet (increased consumption of vegetables and fruit, daily consumption of at least one food with antioxidant action) and physical activity (at least 30 minutes a day). Furthermore the 77% of T1 compliants (50% expected goal) retained healthy eating and healthy motor behaviors even after a year (T2).

The proposed path of empowerment positively affected nutrition and promotion of physical activity at 3 months after the intervention (T1) and were maintained even after a year. The latter result was partly scale down by a high drop out. The path of empowerment, appropriately adapted, can complete the diagnostic therapeutic pathways for breast cancer and colon cancer survivors.

Key messages:

- People are easier involved in empowerment paths aimed at fighting a single disease, for example cancer, but good results can be achieved simultaneously for all non-communicable diseases.
- Motivational communication for healthy eating, physical activity and stress prevention must become an integral part of the therapeutic diagnostic pathways of cancers and non-communicable diseases.

One year update following removal of high sugar sweetened beverages from a university campus

Patricia Fitzpatrick

[6]Hospitality Services, University College Dublin, Dublin, Ireland
Contact: patricia.fitzpatrick@ucd.ie

Healthy UCD is a health promotion initiative designed to create a sustainable healthy university campus. The aim of the study was to report on student and staff attitudes and provider attitudes to the removal and income from drinks one year following the removal of carbonated sugar sweetened beverages (HSSBs) on a large university campus, University College Dublin (UCD).

In 2018 Healthy UCD, in partnership with the contracted beverage supplier, conducted a seven-week trial where all HSSBs were removed from the main campus and replaced with sugar-free or low-sugar alternatives. This was in advance of a levy on HSSBs to be introduced nationally. During the trial, drinks sales rose by 4%. Following the trial, a survey of students was conducted across the campus which provided the motivation to the University Management Team to approve removal of HSSBs on a permanent basis. Staff and student complaints were monitored over the following year. Drinks sales data was obtained from retail outlets for 2019 and compared to the same sales period for the previous year.

Retail sales for drinks continued to grow despite removal of HSSBs, with 8% growth in the year following removal. A small number of complaints were documented. The most important was a query about those staff and students with diabetes mellitus who might need high sugar energy products and the removal of a particular HSSB which is sold in Ireland. This HSSB had not in fact previously been sold in UCD. The national advice regarding access to high sugar products in the case of hypoglycaemia from Diabetes Ireland was provided satisfactorily for all staff and students.

Removal of HSSBs from a university campus is possible; advice must be provided to those who may feel negatively impacted by the change.

Key messages:

- Removal of high sugar sweetened drinks from a university campus is possible; advice must be provided to those who may feel negatively impacted by the change.
- Sales can grow despite health-related changes of the food environment.

Recruitment of women from disadvantaged areas to a smoking cessation intervention: preliminary findings from the We Can Quit2 (WCQ2) cluster randomised controlled trial

Catherine Hayes

C Hayes
Trinity College Dublin, College Green, Dublin, Ireland
Contact: HAYESC9@tcd.ie

Background:

Recruitment of participants into community randomised controlled trials (RCTs) is problematic; however, recruitment of participants from disadvantaged backgrounds to community smoking cessation trials is especially challenging. This paper will present recruitment and retention rates, successes and challenges in the We Can Quit2 (WCQ2) community intervention trial of smoking cessation in disadvantaged women.

Methods:

We Can Quit, is a smoking-cessation behavioural support intervention delivered by community facilitators through 12-weekly group sessions, with free Nicotine Replacement Therapy, against a form of usual care. Sample size was estimated at 194 in total (97 per arm). Four matched pairs of districts of approximately 10,000 women in each (eight clusters) were identified from which eligible women could be recruited. The recruitment target was 24-25 per cluster. Consent was obtained prior to cluster randomisation. Individual participants were recruited via print media such as leaflets, posters, information stands in local facilities e.g. creches as well as through local and social media e.g. radio and targeted Facebook advertisements. A small financial incentive was provided to aid retentions.

Results:

208 women registered for the study. Women heard about WCQ2 mainly via Facebook or Twitter (30.4%), and personal networks (16%) 184 (84.5%) were eligible with living outside the area being the most common reason for ineligibility. 125 (67.9% of eligible women; 65.5% of target) consented. Retention rates will be presented. Barriers to recruitment included time of year. Successful strategies included application of in-depth knowledge of local communities to target eligible women. Social media helped target younger women. Recruitment occurred over four waves, allowing for the application of iterative learning.

Conclusions:

Recruitment to a community based RCT was challenging however, local community engagement, use of social media, and personal networks were successful strategies. Early and active engagement with local stakeholders with in-depth knowledge of the community is important.

Key messages:

- Intense planned community mobilisation is needed to recruit disadvantaged women to smoking cessation trials.
- Social media an important route to recruitment of younger women.

8.N. Citizen and patient access to information and participation

Public participation in health data governance: a scoping review

Cláudia De Freitas

C De Freitas[1,2,3], S Silva[1,2], T Maia[1], M Amorim[1]
[1]EPIUnit, Instituto de Saúde Pública da Universidade do Porto, Porto, Portugal
[2]Departamento de Ciências da Saúde Pública e Forenses e Educa, Faculdade de Medicina, Universidade do Porto, Porto, Portugal
[3]CIES-IUL, Instituto Universitário de Lisboa, Lisbon, Portugal
Contact: claudia_defreitas@yahoo.com

Background:

The sheer growth of the health data shared and traded globally holds great promise and menace to public health. Big health data can foster scientific advancements with potential to heal millions across the globe. However, inerasable digital footprints left by the use of apps and digital services challenge people's privacy and autonomy in (un)foreseeable ways that may cause them to stop sharing data. While many argue that public participation in data governance is a right, others view it as a means to increase data subjects' recruitment and amass large quantities of data. Little systematic knowledge exists, however, about the arguments for and impact of public participation on health data policy and management.

Methods:

A descriptive systematic scoping review was performed. Studies indexed in PubMed, WoS and PsycINFO published until March 2019 were searched. Only empirical, original, peer-reviewed studies reporting on public participation on health data governance were included. Eligibility and data extraction were performed by 3 researchers.

Results:

The 21 studies analyzed point to public participation in several governance dimensions including data access, linkage, dissemination and policy. Involvement of (potential) data subjects in health data governance was substantiated by democratic arguments of legitimacy, transparency and accountability. However, the need to earn public support for data generation and use can override these arguments and foster utilitarian approaches that may transform participatory exercises into a technology of legitimation for a priori made decisions. Furthermore, although public participation in data governance can deliver instrumental benefits (e.g. participant-centred data policy), systematic assessment of participatory exercises' impact is lacking.

Conclusions:

Public participation in health data governance can promote public trust in and thrust for science. Further research is needed to fully assess its impact.

Key messages:

- Democratic-led participatory exercises in health data governance can foster public trust in science.
- Further research is needed to fully assess the impact of public participation in data governance.

Solidarity and reciprocity in data governance: information sharing among gamete donors and recipients

Cláudia De Freitas

T Maia[1], *S Silva*[1,2], *C De Freitas*[1,2,3]
[1]EPIUnit, Instituto de Saúde Pública da Universidade do Porto, Porto, Portugal
[2]Departamento de Ciências da Saúde Pública e Forenses e Educa, Faculdade de Medicina, Universidade do Porto, Porto, Portugal
[3]CIES-IUL, Instituto Universitário de Lisboa, Lisbon, Portugal
Contact: claudia_defreitas@yahoo.com

Background:

Decreasing fertility rates have spiralled a growth in demand for assisted reproduction technologies, including reproduction through donated gametes. Gamete donation is grounded on solidaristic practices traditionally focused on the gift of gametes. However, solidarity and reciprocity between donors and recipients may also be enacted through the sharing of other types of information (e.g. donation outcomes, medical and identifying information). Little is known, however, about these stakeholders' preferences regarding information sharing, which is crucial to promoting people-centred policy for data governance in gamete donation.

Methods:

A self-report structured questionnaire was completed by 69 donors and 161 recipients (participation rate: 77.4%) between July 2017 and April 2018 at the Portuguese Public Bank of Gametes. Opinions about access to donation outcomes and medical, extended profile and identifying information about recipients, donors and children were analysed using descriptive statistics.

Results:

Most participants considered that recipients should not have access to donors' identifying (92%) and extended profile (79%) information, but that they should access donors' medical information (58%). Donors stated more frequently that they should receive information about the outcomes of donation (e.g. pregnancies and births) than recipients (32% vs. 12%). Participants also disagreed with donors' access to recipients' medical (83%) and extended profile information (92%) and children's identifying information (98%).

Conclusions:

People-centred policy on data governance in gamete donation should be informed by donor and recipients' preferences. Sharing donation outcomes with donors and medical information from donors with recipients can foster solidarity and reciprocity between them. This requires the development of a matching mechanism (via consent) to accommodate their preferences.

Key messages:

- Policy on data governance should be informed by gamete donors and recipients' preferences.
- Sharing desired information with donors and recipients can foster solidarity and reciprocity between them.

Solidarity in genomic healthcare? Results of the Belgian citizen forum (2018)

Chloé Mayeur

C Mayeur[1], *W Van Hoof*[1]
[1]Cancer Center, Sciensano, Anderlecht, Belgium
Contact: chloe.mayeur@sciensano.be

Genomic medicine requires to collect and use a huge amount of patient and citizen data. Therefore, the Belgian Minister of Public Health decided to organize a citizen forum on the ethical, legal and societal issues (ELSI) surrounding the use of genomic information in healthcare. This initiative follows the trend of public involvement in Europe regarding ELSI in genomics.

During three weekends, a panel of 32 citizens, informed by experts of different backgrounds, produced political recommendations. We will focus on their conception of solidarity, which is crucial to take into account when considering policies on data sharing in genomics.

Citizens of the panel consider their genome simultaneously as the individual's property and as something to be shared for the common good. As a consequence, the panel agrees to support solidarity provided individual interests, such as privacy protection, are respected. By solidarity, the panel means supporting genomic data sharing for the common good, which they define as scientific research that improves knowledge (on both prevention and diagnostics) to build a fair society where everyone has an equal opportunity to live healthy.

According to the panel, the government should actively encourage citizens to share their genomic data, but no one can be forced to do it. For instance, the government could motivate citizens to share their genomic data by partially reimbursing genomic tests undertaken without medical prescription. However, because everyone has an equal right to live healthy, the panel esteems that genomic tests for medical needs should be accessible for all, thanks to a well-thought-out and sustainable refund system.

Key messages:

- Citizens support solidarity in genomic medicine, but demand proportional individual protection.
- As citizens become increasingly important stakeholders in genomic medicine, all public authorities should actively engage citizens in relevant healthcare policies.

Online health information seeking by parents for their children. A systematic review

Christian Kubb

C Kubb[1], *H Foran*[1]
[1]Institute for Psychology, Department of Health Psychology, Universität Klagenfurt, Klagenfurt, Austria
Contact: chkubb@edu.aau.at

Background:

Parents commonly use the internet to search for information about their child's health-related symptoms and guide parental health-related decisions. Despite the importance of parental search behaviors, this area of research remains understudied and no comprehensive review of this research area has been conducted. Our aim is to summarize the existing findings on searched topics and search experience of online health information seeking among parents for their children with focus on building an agenda for further research and recommendations for public health.

Methods:

We conducted a comprehensive systematic literature review of parental online health information seeking studies in the databases of PsycInfo, JMIR and PubMED. Studies from 1994 to June 2018 were considered.

Results:

A total of 33 studies met the eligibility criteria, including 8665 parents. Findings suggest that parents worldwide are heavy online users of health-related information for their children across highly diverse circumstances. Parents report wishing for more guidance especially from their pediatrician on how to find online health information; however, studies found parents rarely report discussing online health information with their healthcare providers. Only five studies investigated health anxiety related to online health information and prevalences ranged from 14% and 52%, three examined theoretical models, and only three examined consequences of search behaviors more in-depth.

Conclusions:

Results of this systematic review identify important gaps in theoretical models, risk factors to predict search behaviors, and health outcomes associated with parental search behaviors. An agenda for future research will be presented.

Key messages:

- Parents are heavy users of the health-related web, but more research is needed to support them in effective use.
- Tailored digital public health approaches could empower parents to make better use of online resources and improve health-related decision making.

''Patient participation'': Towards a conceptual model and dimensions' descriptions

Beatrice Scholtes

I Ortiz Halabi[1], B Scholtes[2], B Voz[1], I Bragard[1], B Pétré[1]
[1]Department of Public Health, University of Liege, Liège, Belgium
[2]Department of General Medicine, University of Liege, Liège, Belgium
Contact: beatrice.scholtes@uliege.be

Background:

An extensive body of literature has emerged advocating concepts on the collaboration between patients and healthcare systems, such as patient-centred care, patient engagement and patient participation. Several authors have attempted to provide clear definitions of these concepts but no consensus has been agreed upon. This may have hampered their developments and implementation. We thus aim to propose an integrative conceptual model of ''patient participation'' and a description of its dimensions.

Methodology:

Recently, a scoping review studied transversally the concepts related to this collaboration under a generic term ''patient participation''. Based on this review a conceptual model and a description of its dimensions was developed. A summative approach was used to produce the dimensions' description and consisted in systematically adding every new information mentioned in the 38 articles of the scoping review to the final description. The conceptual model was developed based on the theorization methodology of Paillé & Mucchieli (2016).

Results:

The model included 28 dimensions, 6 influencing factors and 4 expected outcomes. They were described and modeled at the three levels of the healthcare system (micro, meso and macro). The model illustrate the relation between: (1) the healthcare professionals' (HPs) and patients' attitudes and skills, and the collaboration between these healthcare actors (micro level); (2) the organisational structure of healthcare institutions and the HPs' and patients' training and access to resources (meso level); (3) results at the macro level did not provide enough information to relate the retrieved dimensions.

Discussion: The production of a conceptual model and the description of its dimension may allow a consensus on the dimensions related to ''patient participation''. Despite its complexity, this model may favour ''patient participation's'' implementation and operationalization at all levels of the healthcare system.

Key messages:

- The results of this study address the confusion existing in the scientific literature on the generic concept of ''patient participation''.
- The results of this study provide a global overview of ''patient participation'' and may impact clinical practice and can be a base for training programs for healthcare professionals and patients.

The determinants of patients' opinions about physicians' services in the Internet-based ranking site

Mariusz Duplaga

P Smola[1], M Martuszewska[1], A Maciak[1], M Duplaga[2]
[1]Students' Scientific Circle, Department of Health Promotion, Institute of Public Health, Faculty of Health Sciences, Jagiellonian University Medical College, Krakow, Poland
[2]Department of Health Promotion, Institute of Public Health, Faculty of Health Sciences, Jagiellonian University Medical College, Krakow, Poland
Contact: mmduplag@cyfronet.pl

Background:

The rankings of physicians' services constructed on the basis of the feedback from patients became a popular form of the appraisal of their work. The main objective of the study was the assessment of predictors of the patients' satisfaction with services provided by physicians of selected specialities.

Methods:

The opinions about physicians of three specialties (paediatricians (P), gynaecologists (G) and family medicine physicians (FM)) who accumulated the highest numbers of opinions, were extracted from the rankinglekarzy.pl website. Only 100 physicians of each specialty who were the most frequently scored were included. Apart from the scores on six individual criteria, the data reflecting the number of opinions (NOO), the type of medical practice (TMP), number of specialties (NS) and PhD title (PhD), as well as the location of the practice (LOP) were collected. The total score was calculated as the sum of scores assigned to individual criteria.

Results:

The final data set consisted of 9482 opinions (4234 for P, 2057 for FM, and 3191 for G). The multivariate regression model revealed that odds of obtaining the maximum total score (MTS) depended on S, NOO, LOP, and TMP. G had higher odds of receiving the MTS than P and FM (OR, 95%CI, 0.75, 0.68-0.83, and 0.72, 0.64-0.82, respectively). MTS was less frequently received by physicians practicing in medical centres (0.56, 0.49-0.62) and hospitals (0.55; 0.44-0.70) than in private practices, but not by those practicing in more than one place (3.81, 2.78-4.21). Higher NOO was related to lower odds of receiving MTS (0.992; 0.990-0.995).

Conclusions:

There are significant differences in patients' assessment of services provided by physicians of three analysed specialties. The type of practice has a considerable impact on the satisfaction of patients. Interestingly, it seems also that the number of specialties and PhD title do not influence patients' opinions about the quality of the medical doctor's services.

Key messages:

- Internet-based rankings of physicians may be an important source of information about provided medical services.
- Key factors influencing patients' opinions include specialty, the type and the location of medical practice, but not scientific a scientific title and number of specialities.

Umbrella review of strategies to improve uptake of screening programmes

Lirije Hyseni

L Hyseni[1], M Maden[2], A Boland[2], C Kypridemos[1], B Collins[1], M O'Flaherty[1]
[1]Public Health and Policy, University of Liverpool, Liverpool, UK
[2]Health Services Research, University of Liverpool, Liverpool, UK
Contact: l.hyseni@liverpool.ac.uk

Introduction:

High participation rates in screening programmes targeting non-communicable diseases are instrumental in achieving full screening benefits; however, screening programmes remain underused, especially among vulnerable populations. We conducted an umbrella review to assess the type of approaches screening programmes use to maximise uptake, the effectiveness of the approaches and the impact on equity.

Methods:
Electronic databases were searched (1999-2019) for systematic reviews on approaches aimed at improving uptake of screening programmes for adults in middle- and high-income countries, with participation rate as the primary outcome. A narrative synthesis was undertaken to present the results by strategy, screening programme and strength of evidence. This study was registered in PROSPERO [CRD42019132087].

Results:
In total, 3,059 records were identified, and 82 systematic reviews were included. Preliminary findings suggest contradictory evidence, and effectiveness appears to depend on the disease screened for and specific program implementation. Invitation methods including letters and direct reminders seem to work universally. However, combined approaches using access-enhancing, individual- and system-directed strategies seem to be more effective than single approaches such as invitation methods alone. Few studies evaluated the impact on equity.

Conclusions:
Strategies to improve uptake of screening programmes have the potential to be effective. However, there are many components within the system, either at individual, health care professional or health care system level that can influence uptake of screening programmes. Within each screening programme, it is likely that a range of interventions is needed to improve the uptake as opposed to a single intervention.

Key messages:
- Improving uptake of screening programmes is a complex issue with many factors influencing the process.
- A range of interventions is favoured over single interventions.

8.O. Skills building seminar: Environmental Burden of Disease: methods and applications

Organised by: Sciensano
Chair persons: Brecht Devleesschauwer - Belgium
Contact: Brecht.Devleesschauwer@sciensano.be

There is an increasing body of evidence showing that environmental risk factors can cause illness and death. For example, particulate matter triggers lung cancer and noise increases the risk of heart attack. Consequently, governments worldwide should aim to mitigate the negative health effects of environmental exposures. The concept of Environmental Burden of Disease (EBD) aims to quantify the number of illnesses and deaths associated with various environmental risk factors, as well as the health benefits of potential prevention and mitigation measures. Current EBD studies commonly use the Disability-Adjusted Life Year (DALY) metric as a common currency for integrating the effects of ill health and premature death, thereby facilitating the comparison of the burden of various environmental risk factors amongst each other and with other risk factors.

The EBD approach has been used since the 1990s, spearheaded by the World Health Organization. However, even today, the approach is not yet commonly adopted across Europe, mainly because of a lack of capacity. At the same time, the EBD approach remains in full development, trying to adapt to the current state of research. The overall aim of this skills building seminar is therefore to a) create awareness of the EBD approach, and b) to present and discuss current methodologies and future developments.

The skills building seminar consists of four presentations. In the first presentation, the history and general methodological framework of the EBD approach will be outlined. Next, three presentations will present EBD case studies. These presentations will explain in a didactic, step-by-step way how the estimates were produced, and how technical challenges were addressed. Finally, ample time will be foreseen to discuss methodologies, challenges, possible solutions, and future collaborations to increase EBD capacity within Europe.

Key messages:
- Participants will gain insights in the use, strengths and weaknesses of the Environmental Burden of Disease approach.
- Participants will develop an understanding of current Environmental Burden of Disease methodology.

Introduction to the Environmental Burden of Disease concept – history, methods and selected results

Dietrich Plass

D Plass[1], M Tobollik[1], D Wintermeyer[1]
[1]Exposure Assessment and Environmental Health Indicators, German Environment Agency, Berlin, Germany
Contact: dietrich.plass@uba.de

Background:
The Environmental Burden of Disease (EBD)-concept was introduced by the World Health Organization to quantify the impacts of environmental risk factors on population health in a comprehensive and comparable way. Since the first Global Burden of Disease (GBD)-study the EBD-methodology was used in numerous global, regional and national assessments.

Methods:
In the EBD-concept data from different sources are joined using a standardized framework. To calculate the EBD several steps need to be taken into account. First, the exposure of the selected population towards an environmental risk factor is estimated. In a second step, exposure data and information from an exposure-response-function are combined by using the population attributable fraction formula. In a last step, the attributable fraction (percentage) is multiplied by the disease burden resulting from a selected health outcome to estimate the share of disease burden attributable to the environmental risk factor.

Results:
Since the first GBD-study several stakeholders have used the EBD-concept to estimate the disease burden attributable to environmental risk factors. This lead to an increased number of available data sets, which - due to the varying assumptions used in the models - are not ad hoc comparable among each other. Generally, the results of EBD-assessments are presented using disability-adjusted life years (DALY) as the core measure of burden of disease assessments. However, e. g. due to lack of data, assessments also focus on the number of attributable deaths, illnesses or single components of the DALY such as the years of life lost due to premature mortality (YLL).

Conclusions:
The EBD-concept allows to compare the impact of environmental risk factors on population health. Though the general concept is widely standardized, assumptions on model parameters can lead to varying results. Therefore, when communicating EBD-results it is necessary to be very transparent about data and model inputs.

Environmental Burden of Disease in the Netherlands

Henk Hilderink

H Hilderink[1], D Schram[1], M Plasmans[1]
[1]RIVM, Bilthoven, Netherlands
Contact: henk.hilderink@rivm.nl

Background:
RIVM-National Institute for Public Health and the Environment published as part of the 2018 Dutch Public Health Foresight report, an update of the Disease Burden,

including the Environmental Burden of disease. This report is not only relevant for the Ministry of Health but also for other policy arenas, to support policy making with the objective of improving health.

Methods:

Environment factors are distinguished by indoor and outdoor environment. The following environmental factors have been taken into account; Air pollution (PM10/NO2), UV radiation, noise, second-hand smoking, carbon monoxide poisoning and indoor dampness. The effects of chemical substances are not included. Making use of the population attributable fraction, the fraction part of mortality, disease burden and health care expenditures attributable to environmental factors is calculated. For this method, data on exposure as well as the dose-response relationship (relative risks) are used.

Results:

Some 4% of the disease burden in the Netherlands is caused by environmental factors and that costs us more than 1 billion euros of care per year. This corresponds with 200,000 DALYs; of which 175,000 by outside environment and 25,000 by indoor environment. In total, almost 13000 deaths can be attributed to environmental factors. Air pollution causes by far most of this disease burden. After that, exposure to UV radiation and second-hand smoking rank highest.

Conclusions:

A considerable disease burden, number of deaths and health expenditures is attributable to environmental factors and could at least in theory be avoided by improving our environment. Air pollution in particular plays an important role in this. In addition, even a greater health gain could be achieved if environment factors are tackled and healthy behavior is at the same time stimulated.

Burden of disease due to nitrogen dioxide exposure in Germany

Dietrich Plass

D Plass[1], M Tobollik[1], D Wintermeyer[1]
[1]Exposure Assessment and Environmental Health Indicators, German Environment Agency, Berlin, Germany
Contact: dietrich.plass@uba.de

Background:

Numerous studies identified adverse effects of air pollution on health. According to the recent Global Burden of Disease Study about 2.9 million people died prematurely due to the effects of ambient particulate matter (PM) pollution in 2016, which resulted in about 70 million years of life lost (YLL). In addition to PM, a growing body of evidence shows convincing associations between nitrogen dioxide (NO2) with several health outcomes. The case study provides a health risk assessment for NO2 in Germany.

Methods:

A systematic review was performed to select health outcomes with strong evidence for an association with NO2 and to derive an updated exposure-response function (ERF). The exposure assessment was performed on a 1x1 km^2 grid by combining measured and modelled data (annual means of NO2 background concentration) with population density. Exposure data and the ERF were combined by the population attributable fraction formula. The main analysis was performed using a counterfactual of 10 $\mu g/m^3$.

Results:

Only for cardiovascular mortality the evidence for the association with long-term NO2-exposure was rated as "strong". Thus, the main analysis merely included this outcome. For the year 2014, 5,966 (95% CI: 2,031-9,893) attributable deaths and 49,726 (95% CI: 16,929-82,456) YLL were estimated. Looking at time trends a decrease of disease burden was observed compared to the year 2007 where 7,832 (95% CI: 2,669-12,973) attributable deaths and 69.244 (95% CI: 23.601-114.690) YLL due to NO2 were calculated.

Conclusions:

Our results show a considerable burden due to NO2 in Germany. Compared to previous estimates for PM (ca. 41,100 attributable deaths in 2014) the burden due to NO2 is much lower. However, due to methodological constraints we could not incorporate higher concentrations from traffic hotspots. This, and the fact that we only considered one health outcome in our main analysis, suggests that our results might be an underestimation.

Burden of disease of heavy metals in population clusters: towards targeted public health strategies

Sofie Theresa Thomsen

ST Thomsen[1], JAR Herrera[2], L Jakobsen[1], S Fagt[1], SM Pires[1]
[1]Division of Diet, Disease Prevention and Toxicology, National Food Institute, Technical University of Denmark, Kgs. Lyngby, Denmark
[2]Translational Disease Systems Biology Group, University of Copenhagen, Copenhagen, Denmark
Contact: sthth@food.dtu.dk

Background:

Humans are exposed to heavy metals from certain foods, thus specific dietary patterns may lead to high burden of disease (BoD). By identifying diet, lifestyle and socio-demographic characteristics of population groups with highest BoD, targeted preventive strategies can be developed. We aimed at identifying clusters and characteristics of Danish individuals with highest BoD due to food exposure to three heavy metals: methylmercury (MeHg), cadmium and inorganic arsenic.

Methods:

We collected diet, lifestyle and socio-demographic information of 3,946 individuals in the Danish National Survey of Diet and Physical Activity. Occurrence of heavy metals in food was obtained from Danish food monitoring. We applied machine learning self-organizing maps to group individuals according to similarities in diet, lifestyle and socio-demographics, and estimated BoD due to metal exposure in terms of Disease-Adjusted Life Years (DALY). We will present calculation steps of our approach in a tutorial-like way and demonstrate its applicability to other cases.

Results:

We identified 13 population subgroups with distinct dietary and lifestyle characteristics. The estimated BoD varied largely between subgroups, with five subgroups experiencing a BoD > 10 DALY/100,000. The cluster bearing the highest BoD (26.2 (95% uncertainty interval (UI): 10.3, 50.6) DALY/100,000) was significantly different from the cluster with the lowest BoD (5.1 (95% UI: 2.5, 9.2) DALY/100,000) (preliminary). BoD was higher in subgroups with diet and lifestyle considered healthy. Most of the BoD was due to MeHg, particularly in female-dominant subgroups.

Conclusions:

Linking machine learning, exposure assessment and burden of disease metrics, this novel approach identified population subgroups with higher BoD due to exposure to three heavy metals. It can be expanded to estimate BoD of other chemicals, and used to develop targeted preventive strategies to reduce BoD in more affected subgroups.

8.P. Trends in primary, ambulatory and integrated care

How primary care and public health interact in local health contracts in France?

Candan Kendir

Ms Kendir[1,2], Mr Le Bodo[3], Mr Breton[3,4], Mr Bourgueil[1,2]
[1]École des Hautes Etudes en Santé Publique, Saint Denis, France
[2]Mission RESPIRE (Recherche en Soins Primaires Innovants et Renouvelés), Saint Denis, France
[3]École des Hautes Etudes en Santé Publique, Rennes, France
[4]Laboratoire Arènes (UMR CNRS 6051), Rennes, France
Contact: candankendir@hotmail.com

The demographic and epidemiological changes orient health care services towards communities with a focus on prevention and health promotion. Moreover, in France, the rapid decline of General Practitioners affect access to care in certain areas. Thus, it has made a call for interaction of primary care (PC) services and public health which can be strengthened by the actions at the local level. In 2009, the local health contracts (Contract local de santé; CLS) were developed to foster collaborative actions on the social determinants of health and to improve access to care. Considering the critical contribution of PC in these issues, one may ask how CLS mobilized PC and facilitate linkages between actions oriented toward population and primary care.

The objective of this ancillary study (part of the CloterreS project), is to explore how often and how CLS involve PC in access to care and public health related actions.

A mixed-method study based on document analysis, with a random sample of 17 CLSs (N = 165) from all French regions, was developed. A quantitative analysis of the 440 forms identified in 17 CLS computed frequency of involvement of PC actors and/or PC organizations and a qualitative analysis defined typology of interactions.

All CLS and 20.1% (n = 86) of the forms involved PC actors and 43.2% (n = 185) concerned access to care. Of the access to care forms, 35.7% (n = 66) concerned PC. The most common strategies related to actions on the health workforce and on planning of services. The role of primary care professionals was as the target of the action and rarely as leader and partner.

PC, mostly GP's involvement, had a big place and access to care was at the core of local health contracts. The impact of CLS as an instrument to invite interaction public health and healthcare at the local level should be further assessed.

Key messages:

- Many of the local access to care actions involved primary care professionals.
- The local level appears strategic to integrate public health and health services yet more evidence is needed on its role.

Organizational Culture and Readiness for Change in German pediatric outpatient centres

Sabine Georg

S Georg[1], T Görig[1], M Eichinger[1], D Hoffmann[3], MS Urschitz[3], F De Bock[1,2]
[1]Mannheim Institute of Public Health, Medical Faculty, Ruprecht Karls University Heidelberg, Heidelberg, Germany
[2]Federal Centre for Health Education, Cologne, Germany
[3]Institute of Medical Biomeetrics, Epidemiology, Informatics, Medical Faculty, Johannes Gutenberg University Mainz, Mainz, Germany
Contact: sabine.georg@medma.uni-heidelberg.de

Background:

Organizational readiness for implementing change (ORIC) is presumed key for successful change in healthcare settings. At the same time, ORIC is theorized to depend on cultural and other factors of the organizational context. Within the process evaluation of the PART-CHILD intervention in interdisciplinary pediatric outpatient centres (IPOC) for children with chronic health conditions in Germany, we assessed to what extent ORIC is associated with organizational culture and further contextual factors.

Methods:

In 2019 data was collected from health care professionals in 12 IPOC, using a questionnaire comprising subjectively perceived ORIC (measure: ORIC, 5-point Likert scale), the organization's culture (measure: Competing Values Framework, four domains: Group, Developmental, Rational, and Hierarchical Culture) and further contextual factors (e.g., size of the facility, number of patients per year).

Results:

In all, responses from 206 health care professionals were included in the analyses (response rate: 47%; preliminary results). Analyses show a moderate ORIC (3,4; SD = 0,6), positively associated with Group Culture (r2 = 0,178, p = 0,01) and negatively associated with Rational Culture (r2 = -0,273, p < 0,001). We found no correlations between ORIC and Developmental or Hierarchical Culture. In congress presentation we report to what extent ORIC depends on further contextual factors (e.g., size of the facility, patients' demographic characteristics).

Discussion:

IPOC with a strong Group Culture show a higher ORIC than those with prevailing Rational Culture. To potentially increase effective implementation of interventions in healthcare facilities in future, a preceding evaluation of the organizational culture might be valuable. Thereby, settings with prevailing Rational Culture could be identified at an early stage and receive additional implementation support, e.g. through enhancing the Group Culture among the health care professionals on-site (e.g, executive coaching).

Key messages:

- Both organizational readiness for implementing change and organizational culture are presumed to be important for implementing change in healthcare facilities' routine care.
- Assessing both constructs prior to implementing a costly intervention with demanding change processes within healthcare settings could be valuable.

Time to use of primary health care after being informed about increased health risk in HUNT

Marlen Toch-Marquardt

M Toch-Marquardt[1], K Pape[1], F Carlsen[2], JH Bjørngaard[1]
[1]Department of Public Health and Nursing, Norwegian University of Science and Technology, Trondheim, Norway
[2]Department of Economics, Norwegian University of Science and Technology, Trondheim, Norway
Contact: marlen.toch@ntnu.no

Background:

Seeing a general practitioner (GP) after first discovering conditions related to ill health is important for the prevention or timely treatment of major diseases. Receiving information about increased health risk, e.g. from participating in a health study, might increase awareness and trigger a visit to the GP. The question is: Do people allocated in different socioeconomic (SE) groups respond differently to receiving information about increased health risk? This could indirectly increase socioeconomic inequalities in health. In this study we are aiming to analyse patterns of GP contact after being informed that measurements from the HUNT study had deviant values suggesting increased health risk.

Methods:

We use data from several Norwegian national registries which were linked to the HUNT study (The Nord-Trøndelag Health Study). Cox-proportional hazard models as well as repeated measurement models are estimated in order to explore patterns of GP contact. Health exposures are: measured high blood pressure (BP) (systolic and diastolic), high blood glucose, high serum cholesterol. SE status is measured through educational attainment (low, medium, high).

Preliminary results:

In the analysis for GP contact within a year after HUNT, we had information on 42,581 persons, with 295,188 contacts with primary health service. In our data 8% had clinical measurements indicating high BP (160/100), 60% had high serum cholesterol levels (5,2 mmol/L) and 3% had high blood glucose levels (> = 9 mmol/L). Women in the lowest social group generally used less time to see their GP than both higher educational groups. For men this was less clear cut.

Conclusions:

We aimed to analyse SE differences in response to receiving information about increased health risk. The analysis thus far suggests that women in lower SE groups see their GP a relatively short time after being informed. This is less clear cut for men. Further analysis will shed further light on utilisation patterns.

Key messages:

- Women in lower SE groups take less time to see a GP after being informed of increased health risk.
- SE differences in primary health care utilisation might be less clear cut than previously suggested.

Characteristics and outcomes of clusters of multimorbid patients in UK general practice

Yajing Zhu

Y Zhu[1], D Edwards[2], S Kiddle[1], R Payne[3]
[1]MRC Biostatistics Unit, University of Cambridge, Cambridge, UK
[2]The Primary Care Unit, University of Cambridge, Cambridge, UK
[3]Population Health Sciences, Bristol Medical School, University of Bristol, Bristol, UK
Contact: yajing.zhu@mrc-bsu.cam.ac.uk

Background:

Current clinical specialities, guidelines and quality of care metrics are organised around single diseases and treatments of multiple conditions are rarely coordinated, resulting in insufficient or even conflicting care. This study uses large scale English general practice (GP) records to identify and characterise clusters of patients based on their multimorbidity to allow better design of health services and highlight groups that require additional interventions.

Methods:

This is a retrospective cohort study that includes multimorbid adult patients (N = 113,211), from a random sample of 391,669 English patients with valid GP records in 2012 where 38 long-term conditions were defined. Latent class analysis, stratified by age groups, was used to identify multimorbidity clusters. Class solutions are validated and associations between multimorbidity clusters, patient characteristics, public health service utilisation and mortality are assessed.

Results:

Poor socioeconomic status is associated with clusters with higher service use and mortality risk. Physical-mental health co-morbidity is a major component of multimorbidity across all age strata. The clusters with highest age-stratified mortality risk in under 65 year olds were linked to alcohol and substance misuse, whereas in over 65 year olds they were linked to cardiovascular disease. The largest cluster in the 85+ years strata (58%) has the lowest number of morbidities, a low degree of service use and mortality. Consistency was seen across identification and validation data.

Conclusions:

We find a clear distinction between morbidity clusters, both in the prevalence of long term conditions within them, and in their associations with outcomes (service use and mortality). Specific health services and interventions might be more effective when targeted on the distinct types of multimorbidity we have identified, with a particular focus on the morbidity clusters associated with the worst patient outcomes.

Key messages:

- The first study to derive age stratified multimorbidity clusters from a large GP record system, whose patients are representative of the English population.
- Knowledge about particularly dangerous clusters of multimorbidity, such as those involving alcohol and drug use in 18–64 years old, and cardiovascular disease in those 65 years or older.

Individual and area-level factors associated with ambulatory care sensitive conditions in Finland

Markku Satokangas

M Satokangas[1,2], M Arffman[1], A Leyland[3], I Keskimäki[1,4]
[1]Service System Research Unit, National Institute for Health and Welfare, Helsinki, Finland
[2]Department of General Practice and Primary Health Care, University of Helsinki, Helsinki, Finland
[3]MRC/CSO Social and Public Health Sciences Unit, University of Glasgow, Glasgow, Finland
[4]Faculty of Social Sciences, Tampere University, Tampere, Finland
Contact: markku.satokangas@thl.fi

Background:

Geographic variation is common in ambulatory care sensitive conditions (ACSCs) - used as a proxy indicator for primary care quality. Its use is debated as it is more strongly associated with individual socioeconomic position (SEP) and health status than factors related to primary care. While most earlier studies have been cross-sectional, this study aims to observe if these associations change over time. Finland offers a good possibility for this due to its extensive registers and unexplained over time convergence of geographic variation in ACSC.

Methods:

This observational study obtained ACSCs in 2011-2017 from the Finnish Hospital Discharge Register and divided them into subgroups of acute, chronic and vaccine-preventable causes. In these subgroups we analysed geographic variations with a three-level multilevel logistic regression model - individuals, health centre areas (HC) and hospital districts (HD) - and estimated the proportion of the variance at each level explained by individual SEP and comorbidities, as well as both primary care and hospital supply and spatial access at three time points.

Results:

In the preliminary results of the baseline geographic variation in total ACSCs in 2011-2013 - the model with age and sex - the variance between HDs was nearly twice that between HCs. Individual SEP and comorbidities explained 46% of the variance between HDs and 29% between HCs; and area-level proportion of ACSC periods in primary care inpatient wards a further 12% and 5%. This evened out the unexplained variance between HDs and HCs.

Conclusions:

Geographic variation in ACSCs was more pronounced in hospital districts than in the smaller health centre areas. The excess variance between HDs was explained by individual SEP and health status as well as by use of primary care inpatient wards. Our findings suggest that not only hospital bed supply, but also the national structure of hospital services affects ACSCs. This challenges international ACSC comparisons.

Key messages:

- Geographic variation in ACSCs concentrated in larger areas with differing population characteristics.
- The national structure of hospital services, such as use of primary care inpatient wards, affects ACSCs.

Benefits of performing same day discharge lead and varicose interventions in active patients

Asma Hamid

A Hamid[1], G Lamirault[2], Y Gouëffic[3], N Le Meur[1]
[1]REPERES Pharmacoepidemiology and Health Services Research, EHESP Rennes, Rennes, France
[2]L'institut du Thorax, INSERM, CNRS, CHU Nantes, Nantes, France

[3]L'institut du Thorax, Service de Chirurgie Vasculaire, CHU Nantes, Nantes, France
Contact: asma.hamid@eleve.ehesp.fr

Background:

In France, 90% of varicose vein interventions are performed in ambulatory setting while it concerns 7% of angioplasty for lower extremities arterial disease (LEAD). In this study, we made the hypothesis that such disparities may partly be due to the burden of the post-procedural rehabilitation and its relation to patients' care-pathway and coordination.

Methods:

A retrospective study was conducted on 18 to 65 years old active population who benefited from varicose or LEAD interventions from January 2013 to June 2016 using data from the French National Health Insurance System. Post-procedural rehabilitation measure was the number of cumulated workday break and their renewals within 180 days after intervention. Negative binomial regressions, adjusted for age, gender, and comorbidities, were applied to test associations. The degree of coordination among health care professionals for post-procedural follow-up was tested using the continuity of care and the continuity of prescription indices.

Results:

Compared to inpatient care, day interventions decrease the incidence rate ratio (IRR) of cumulated workday breaks by 14% in both varicose vein and LEAD interventions. The decrease in the degree of coordination between care providers increase the IRR of cumulated workday breaks and renewals by 37% and 29% respectively for varicose, and 11% and 9% for LEAD interventions. The increase in the number of work break prescriptions delivered by the same category of providers decreases the IRR of cumulated workday breaks and their renewals in varicose by 25% and 21% but increases them in LEAD interventions by 240% and 106%.

Conclusions:

Day interventions have similar impacts on rehabilitations after varicose vein and LEAD interventions. However, coordination is critical. Our results highlight the need to pursue health regulatory agencies and healthcare professionals' works on multidisciplinary ambulatory care networks for better follow-up of acute day care interventions.

Key messages:

- Day intervention reduces cumulated workday breaks in endovascular interventions.
- Multi-specialty coordination of the qualified health care professionals is required in endovascular interventions, especially after angioplasty for LEAD in outpatient settings.

8.Q. Current issues in the health workforce

Migration intentions among Polish physicians - the profile of a potential migrant

Alicja Domagała

A Domagała[1], K Dubas-Jakóbczyk[1]
[1]Jagiellonian University Medical College, Institute of Public Health, Krakow, Poland
Contact: alicja.domagala@uj.edu.pl

Background:

Polish physicians migration has become a subject of interest in the context of current shortage of medical staff. The exact scale of migration is unknown due to insufficient data. The main goals of the study were to: 1) evaluate the scale of migration intentions among doctors working in Polish hospitals, 2) identify the key predictors and barriers of migration, 3) investigate an association between doctors satisfaction and their tendency to migrate.

Methods:

A quantitative, on-line survey of doctors working in Polish hospitals was conducted between March and June, 2018. 15 cross-nationally distributed hospitals (7 general, 5 specialist, 3 university) were included in the study. The statistical analyses included: associations between the intention to migrate and demographic characteristics as well as work-related variables and overall satisfaction. Simple and multivariable logistic regression analysis was conducted to determine which variables are significant predictors of the intention to migrate.

Results:

1.003 questionnaires were analyzed (response rate: 38%). 273 respondents declared the intention to migrate, including 45 (4.5%) answering 'definitely yes' and 228 (22.7%) 'probably yes'. Men more often considered the option to migrate: 5.2% answered 'definitely yes' and 26.3% 'probably yes' in comparison to 3.7% and 19.0% respectively for females ($p = 0.02$). Childless physicians more often considered the option to migrate than those with kids (9.0% answered 'definitely yes' and 33.1% 'rather yes' vs 2.4% and 17.8%, respectively, $p < 0.001$). Almost 62% of doctors with the intention to migrate considered a temporary stay abroad. 70% of respondents indicated 'leaving family' as main migration barrier.

Conclusions:

The intention to migrate is related to socio-demographic factors (gender, age, marital status, having children) and work-related factors (work experience, working hours). The intention to migrate is negatively related to physician satisfaction.

Key messages:

- The main reasons for the intention to migrate are: higher earnings abroad, better working conditions, the ability to achieve better work-life balance and better training opportunities.
- In Poland a holistic, systemic approach to health workforce planning should be implemented, including monitoring migration trends and improving working conditions.

Career satisfaction of Polish physicians – evidence from a survey study

Alicja Domagała

A Domagała[1], JN Peña-Sánchez[2], K Dubas-Jakóbczyk[1]
[1]Jagiellonian University Medical College, Faculty of Health Sciences, Institute of Public Health, Krakow, Poland
[2]Department of Community Health and Epidemiology, College of Medicine, University of Saskatchewan, Saskatoon, Canada
Contact: alicja.domagala@uj.edu.pl

Background:

Understanding physician satisfaction and the factors associated are relevant for physicians, their patients and decision makers. We conducted the first national-wide study evaluating the satisfaction of Polish doctors using a multidimensional approach. The aims of this study were to: 1) measure the career satisfaction of physicians working in Polish hospitals, and 2) identify the factors associated with higher levels of career satisfaction.

Methods:

A quantitative, on-line survey among 15 nation-wide distributed Polish hospitals (7 general, 5 specialists, and 3 university) was conducted between March and June 2018. A 17-item questionnaire was used to measure satisfaction on a scales from 1.00 to 6.00, as well as their personal, professional, performance, and inherent satisfaction levels. In total, 1.003 questionnaires were included in the study (response rate = 38%). Unconditional associations and multivariable regressions models were used to evaluate associations between satisfaction levels and their demographic and work-related factors.

Results:

The mean level of physician satisfaction was 4.10 (SD = 0.69). Almost 57% of the doctors reported being from ''somewhat satisfied'' to ''very satisfied'' with their careers; although, only 8.2% reported being satisfied or very satisfied with their career ($\geq$5.00). Doctors reported high levels of inherent satisfaction (mean = 4.4, SD = 0.66) and low levels of personal satisfaction (mean = 3.78, SD = 0.98). Age and work experience were positively and significantly associated with satisfaction.

Conclusions:

The satisfaction of Polish physicians is moderate. Doctors reported higher levels of satisfaction with their interactions with direct supervisor, other physicians, nurses, doctor-patient relationships and the lowest satisfaction with the salary and work-life balance. Gender, numbers of working hours/week; years of work experience and the stage of professional development were the factors associated with higher satisfaction.

Key messages:

- The satisfaction of physicians working in Polish hospitals is moderate. The current shortage of Polish physicians makes their satisfaction especially significant for motivation and retention.
- Physician satisfaction is an important indicator for managers. Attention regarding levels and factors affecting doctors' satisfaction should be one of the key issues of health workforce management.

What doctors and nurses think about the residents' role within the Academic Hospital of Udine?

Edoardo Ruscio

E Ruscio[1], C Smaniotto[1], M Del Pin[1], M d'Angelo[1], G Perri[1], M Fabricci[1], L Brunelli[1], C Londero[2], L Castriotta[2], S Brusaferro[1,2]
[1]Department of Medicine, Università degli Studi di Udine, Udine, Italy
[2]Udine Healthcare and University Integrated Trust, Udine, Italy
Contact: ruscio.edoardo@spes.uniud.it

Background:

Residents have a significant role in both patient's care and daily ward activities; thus, they should be trained to adhere to hospital procedures and to guarantee best clinical practices and patient's safety. A survey was carried out to assess healthcare workers' (HCWs) opinions about residents' role and performance.

Methods:

Between February and March 2019, a paper-based/online survey was developed and distributed among both doctors (d) and nurses (n) in 17 (10 medical, 7 surgical) wards of Udine Academic Hospital, Italy. 22 Likert Scale questions (1-totally disagree, 5-totally agree) investigated 5 areas: respect of patient safety and privacy, healthcare quality, clinical risk management, role played within medical team, satisfaction concerning training activities planning. Profession, ward (medical/surgical), age and sex were considered as exposures. Descriptive analysis, median(M)±interquartile range, and ordered logistic regressions were performed with Stata software.

Results:

The survey involved 153/785 HCWs' (112/477 nurses and 41/308 doctors). All the units were represented with at least 1 HCWs; answers from both categories were collected in 82% of wards. Data analysis showed that nurses gave lower scores about residents' respect of patient privacy than doctors: patient privacy protection: M(d) = 4±0, M(n) = 4±1, OR(d/n) 2.60, [95%CI, 1.04-6.52]; sensitive data management: M(d) = 4±0, M(n) = 3±1, OR(d/n) 2.97, [95%CI, 1.26-7.02]. The same resulted regarding clinical risk management: patient record management: M(d) = 4±0, M(n) = 3±2, OR(d/n) 13.64 [95%CI 5.30-35.12]; proper hand hygiene: M(d) = 4±1, M(n) = 3±1, OR(d/n) 5.56 [95%CI 2.35-13.17]; incident reporting: M(d) = 4±1, M(n) = 3±2, OR(d/n) 7.05 [95%CI 3.14-15.86].

Conclusions:

Nurses appeared to be more critical than doctors about residents performances in safety and privacy and clinical risk management areas. Reasons behind these different opinions should be investigated in order to improve constantly healthcare's quality.

Key messages:

- Residents hold a key role in healthcare quality, therefore it is significant evaluate their practice regarding patient's safety and privacy.
- Doctors and nurses opinions on residents adherence to hospital procedures in order to guarantee best clinical practices and patient's safety differ significantly.

Nurse's job satisfaction and organization's innovation propensity: organizational climate in Italy

Chiara Barchielli

C Barchielli[1], C Seghieri[1], M Vainieri[1]
[1]Istituto di Management, Scuola Superiore Sant'anna, Pisa, Italy
Contact: c.barchielli@santannapisa.it

The concept of job satisfaction positively correlates with many areas investigated by the organizational climate. We focused on nurses' perception towards job satisfaction, as it is relevant regarding nursing care delivery's quality, which is directly linked to patients' safety. Additionally, we provide a measure of the relative importance that each investigated factor has on nurses' job satisfaction and their willingness to recommend the organization they work in to other professionals.

A validated census survey was administered in eight different Italian Regions. A total of 35.156 observations were the object of different analysis preformed using STATA. The questions/statements were Likert scaled from 1 to 5 and were compared to the exposure one ''I am satisfied with my work in my structure/unit''. The research population has an average age of 47 years (females 80.36% ,men are 19.64%) and men are more satisfied than women with their work. There are various factors that impact the area of ''job satisfaction'' with different importance (all statistically significant): feeling of encouragement to react after the experience of a failure (OR 2.23), empowerment over quality job results (OR 1.68), sustainable work pace (OR 1.47), firm's propensity towards innovation (OR 1.36), and experience discomfort while working (OR 1.05). Other factors impacted the area ''I would recommend to a colleague to work in my firm'' with different importance (all statistically significant). These factors include: firm's propensity towards innovation (OR 2.84), feeling of encouragement to react after the experience of a failure (OR 1.43), sustainable work pace (OR 1.32), empowerment over quality job results (OR 1.31), experience discomfort while working (OR 1.02).

The two most important levers, innovation and inclusion can be beneficial to improve workforce experience and care delivery. Managerial implications: data can show which levers to use in order to achieve the most desired goals.

Key messages:

- nurses' perception towards job satisfaction is relevant regarding nursing care delivery's quality, which is directly linked to patients' safety.
- Innovation and inclusion can be beneficial to improve workforce experience and care delivery.

National survey of UK general practice pharmacy services

Vilius Savickas

V Savickas[1], E Foreman[1], M Iqbal[1], A Ladva[1], SK Bhamra[1], R Sharma[2], SA Corlett[1]
[1]Medway School of Pharmacy, University of Kent, Gillingham, UK
[2]Primary Care Pharmacy Association, Woking, UK
Contact: v.savickas@kent.ac.uk

Background:

The Clinical Pharmacists in General Practice (CPGP) initiative aims to recruit over 2000 clinical pharmacists in general practice (GP) surgeries in England by 2020. This study aimed to explore the services delivered by all GP pharmacy professionals (GPPPs; pharmacists/pharmacy technicians) across the UK.

Methods:

30-item e-questionnaire was developed using SurveyMonkey platform and piloted during one-to-one cognitive interviews with GPPPs. The survey was distributed via the Primary Care

Pharmacy Association, social media sites, collaborating GP organisations and via emails to participants of CPGP pilot. Three reminders were sent out 1 week apart. University ethics approval was obtained.

Results:

Ninety-one responses were received between November 2018 and March 2019 (89% pharmacists, 52% from CPGP pilot). Participants provided an average of 9 services (95% CI 8.3-9.9). Over 90% of pharmacists delivered medication reviews and over 80% managed patients with polypharmacy. More pharmacists within than outside of the CPGP pilot managed repeat prescribing requests (70% vs. 47%, p = 0.035). Technicians took responsibility for primarily non-clinical services such as service commissioning (90%), management of safety alerts/drug recalls (80%), standard operating procedures (80%) and education & training (80%). Over 40% of GPPPs not providing care home services wished to do so by 2024. Four technicians wanted to be more involved in medication reviews. The main perceived benefits of GP pharmacy services included identifying medicines-related issues (93%), utilisation of pharmacy professionals' skills (93%) and a reduction in medication waste (92%).

Conclusions:

GPPPs provide a range of clinical and non-clinical services which may benefit public health at an individual and healthcare system levels. Pharmacists within the pilot are more likely to deliver repeat prescribing services. Future GP pharmacy landscape will likely include additional services to care homes.

Key messages:

- GPPPs including pharmacy technicians provide clinical and non-clinical services, appropriate to their scope of practice, to benefit patients, healthcare systems and themselves.
- Developing future GP pharmacy services to care homes offers further opportunities to benefit a vulnerable group of patients with long-term illnesses.

Essential knowledge for junior doctors regarding infectious disease control: a modified Delphi study

Nienke van den Berg

NM van den Berg[1,2], MLA de Hoog[1], MC Seeleman[1], M Jambroes[1]
[1]Julius Center, University Medical Center Utrecht, Utrecht, Netherlands
[2]Infectious Disease Control, Municipal Health Service, Zwolle, Netherlands
Contact: n.m.vandenberg-5@umcutrecht.nl

Background:

Physicians play an important role in the control of emerging infections and antibiotic resistance. Therefore, all physicians should have sufficient knowledge regarding infectious disease control. It is unknown what knowledge is considered as sufficient; the Dutch National Framework on learning outcomes for medical curricula only offers general terms for this topic. The aim of this study was to determine which learning items are considered as essential knowledge for junior doctors in the Netherlands. The results can support curriculum development regarding infectious disease control.

Methods:

An online two-round Delphi study was performed, involving four expert groups: general practitioners; public health physicians; medical students; and educational coordinators of Dutch universities. Experts were asked to rate sixteen learning items, selected by a literature review. A learning item was considered as essential knowledge if at least 80% consensus was reached on a 5-point Likert scale. Respondents were able to explain their score, to alter the exact wording after each learning item and to add learning items. This input was used for qualitative analysis, in addition to the quantitative scores.

Results:

Both rounds of the study were completed by 27 experts. Six learning items were identified as essential knowledge based on the 80% criterion. By combining qualitative and quantitative data, two additional learning items were identified. Important learning items were mainly focused on understanding and applying basic principles on a case, like identifying measures to prevent spread of infections based on transmission route.

Conclusions:

To our knowledge, this study is the first to identify a list of essential learning items on infectious disease control, which can be used for training purposes. This list supports curriculum development in medical education and strengthens the infrastructure for infectious disease control in the Netherlands by training professionals.

Key messages:

- The Delphi method helped us to identify essential knowledge concerning infectious disease control for junior doctors. The results can be used to increase the knowledge base for this topic.
- Essential knowledge focuses mainly on understanding and applying basic principles to a case. Detailed knowledge is considered less important, provided that physicians know where and when to find it.

9.A. Workshop: Better prison health for better public health

Organised by: EUPHA (IDC), EUPHA (MIG), EUPHA (PHPP)
Chair persons: Ana Carina Ferreira Borges - Denmark, Sofia Ribeiro - Portugal
Contact: lara.tavoschi@unipi.it

According to the latest data, in 2018 about 590,000 people were held in prison on any given day in the EU, and more than double in the entire region. People in prison face multiple and complex health care issues, including a higher prevalence of communicable diseases than the general population. These are likely to be the result of a combination of overlapping, and sometimes interlinked, risk factors for infection, ill-health, and incarceration, such as problem drug use. Incarceration may facilitate the offer of quality health care services to people who are otherwise hard to reach and provide an occasion to target socially deprived groups who often have low level of healthcare access when in the community. Delivering health protection and harm reduction programmes in prisons not only benefits the prison population but also has the potential to reduce the risk of transmission of some infectious diseases in the community, intervening earlier in the natural history of disease. They are also likely also to have a knock-on effect in supporting individuals' reintegration into community life and future health - providing a 'community dividend' to health interventions in prisons. Yet, such health gains may be diminished by suboptimal integration with community services. Continuity of care, or throughcare, between prison and community services is a mainstay of any health care interventions delivered in detention, especially when tackling chronic conditions (e.g. HIV, mental illnesses) or problem drug use.

The World Health Organization (WHO) has long supported the concept of prison health as an inseparable component of public health. This view is enshrined by the principle of Equivalence of Care between prison and community, endorsed by the United Nations in the Nelson Mandela Rules. During the 2019 WHO Prison Health Conference in Helsinki, it was acknowledged that prisons contribute to achieving the UN's Sustainable Development Goals through improving health, reducing health inequalities and provide a fairer and safer society for all. However, a number of challenges hampers the successful implementation of such a concept, including the need for evidence-based decision making, inter-sectoral partnerships and adequate monitoring systems.

This workshop will provide attendees with a comprehensive overview of prison health and the relevance of a multi-sectorial public health approach to frame and address it. The workshop will be structured around three main topics: governance of prison health and current models in Europe; health issues and disease burden in the prison population; current and future perspectives for evidence-based approaches to prison health. The discussion of two case studies, problem drug use and HCV micro-elimination, will create the context for an in-depth analysis of key challenges for prison health implementation, reflecting on aspects such as health needs, equity, multi-disciplinarity, continuity of care, monitoring and community dividend.

Key messages:

- Provide a comprehensive picture of the main challenges of prison health in Europe, the public health issues affecting the prison population and how these relate to community public health systems.
- Reflect on how public health systems need to incorporate prison health into their strategies for reducing inequalities and improving health outcomes of vulnerable and socially deprived populations.

The health of people in prison in Europe

Eamonn O'Moore

E O'Moore[1], *S Sturup-Toft*[1]
[1]Health and Justice, Public Health England, London, UK
Contact: Eamonn.O'moore@phe.gov.uk

This presentation will explore the rationale behind a public health approach to prison health covering aspects such as the socio-demographic composition of the prison population in Europe, its health status and main health needs, based on the current sources of data. The link between the prison population and the wider community will be analyzed alongside the concept of community dividend, defined as the benefit of prison-related intervention for general population health.

Prison health: governance and monitoring do matter

Daniel Lopez-Acuña

D Lopez-Acuña[1]
[1]World Health Organization, EURO, Copenhagen, Denmark
Contact: lopezacunad@gmail.com

This presentation will focus on the concept of good governance for prison health, touching upon concepts such as equivalence of care, independent healthcare, standards of care and human rights approaches to healthcare in detained settings. Effective governance and policymaking are supported and fostered by timely and accurate information, however this is largely lacking in European prison systems. Although some steps ahead have been made with the launch of the Health in Prisons European Database (HIPED) in 2016, strengthening health information systems in prison settings is a key priority.

Evidence-based decision making for prison health

Lara Tavoschi

L Tavoschi[1]
[1]Translational Research and New Technologies in Medicine, University of Pisa, Pisa, Italy
Contact: lara.tavoschi@unipi.it

The presentation will provide an overview of the current evidence base on prison health interventions, gaps and challenges for conducting research in prison settings. Evidence based decision making is relevant for prison health, not only in terms of resources allocation, but also in relation to interventions and implementation approaches. Yet scientific literature covering prison health is generally quite limited. Lack of research activities in prison settings may be the results of several factors, partly deriving from structural challenges, and partly from specific features of the prison population. These include supplementary ethical implications, issues related to confidentiality and management of personal information and shortage of health care and other staff trained in conducting research. Low priority attributed to prison health in the sub-national, national or international research agenda may result in less opportunities for funding. Grey literature and programmatic data are regarded as an additional source of information; however accurate or reliable data are rare in Europe. While evidence is limited, there is a growing interest in prison health in Europe. A number of systematic reviews conducted in recent years shed some new light on key aspects of epidemiology and healthcare in prison. At European level various institutions and agencies and national institutions have been engaged in prison health and have produced a number of authoritative documents, including a few guidance documents.

Case study: Drug related problems in prison settings

Marialinda Montanari

M Montanari[1]
[1]Public Health, European Monitoring Centre for Drugs and Drug Addiction, Lisbon, Portugal
Contact: Linda.Montanari@emcdda.europa.eu

Persons in prison generally have poorer physical and mental health and social well-being than their peers in the community, reporting high rates of acute and chronic physical and mental disorders, including, substance use disorders and drug related infectious diseases. People in prison report high prevalence of illicit drug use before and during incarceration and high rates of drug related infections. Acute risks for those using drugs are found in the first period after prison release. Available interventions in prison setting lower life expectancy than their peers in the community. Common risk and social factors are related to poor health and imprisonment and those two components should be addressed in a comprehensive way. The presentation will provide an overview of the last available data on drug use, drug related problems and prevalence of infectious diseases in prison in the European countries.

Case study: HCV micro-elimination in prison

Fadi Meroueh

F Meroueh[1]
[1]The European Federation for Prison Health - Health without Barriers, Montpellier, France
Contact: fadimeroueh@gmail.com

The presentation will explore the concept of HCV micro-elimination in prison settings end its application in the context of French prisons. Hepatitis C is a chronic pathology of the liver and can significantly affect quality of life, with significant mortality rates. Hepatitis C is of great relevance for prison population due to the overlap of risk factors for both incarceration and HCV infection, including substance use disorders. Historically, HCV interferon-based therapy has not always been offered to people in prison due to various factors, including homelessness, active injecting drug use, and liver disease. With the advent of direct-acting antivirals, almost 100% of patients are experiencing successful HCV treatment, with no medical contra-indication for incarcerated individuals, drug users and/or individuals on opioid substitution treatment. Approaches based on HCV test and treat have proven to be successful in prison settings to achieve micro-elimination and to offer HCV appropriate care to individuals belonging to socially-deprived groups and characterised by limited access to care when in the community. The elimination of hepatitis C in prison, among people who use drugs, also requires effective Harm Reduction programmes, an important tool to prevent re-infections.

9.B. Workshop: Bringing economics, health and migration together: a mutual learning experiment

Organised by: Work group 'Economic arguments in migrant health policy making'
Chair persons: Kayvan Bozorgmehr - Germany
Contact: nora.gottlieb@tu-berlin.de

Acknowledging the role of economic arguments in political discourses and decision-making, researchers have begun to pay more attention to the fiscal implications of different health policy options for migrants. As yet, empirical evidence on economic effects of policy responses to migration and the societal costs or cost-effectiveness of competing strategies to address migrants' health needs is scarce. Methodological challenges such as limited availability and accessibility of decent data often impede the generation of robust evidence. Further, little is known as to how evidence can effectively be moved into policy; e.g., the actual clout of economic arguments in migration policies debates, as opposed to other evidence- or value-based arguments, hitherto remains unclear. In other social policy domains such as educational and labour market integration, economic evaluations have become routine components of policy assessments. And under the title of, e.g., knowledge translation, strategies for the introduction of research evidence into political decision-making processes have been developed. The combination of similar goals and challenges suggests that there are opportunities to build bridges across sectors and disciplines - e.g., public health, social epidemiology, economics, social policy, data science - as well as across research-practice-divides, for the purposes of mutual learning and the joint improvement of research outcomes.

The goal of this workshop is to start such learning processes by bringing together researchers and professionals from different fields, by sharing existing knowledge, and by jointly exploring the following questions:

- What are the thematic intersections, tensions and synergies between the different disciplines? What are common goals and questions? Which kinds of different knowledge complement each other towards those goals?
- Where are options for mutual learning, methodological transfer and/or synthesis? How can they help to overcome current challenges in estimating the costs of divergent migrant health policies?
- What can be learnt from existing knowledge translation strategies as regards the role of research for migrant health policy making?
- What challenges and open questions remain?

The workshop will start with a brief introduction of key concepts and objectives. The first presentation will use three case studies to reflect on the potential of economic evaluation for improving health screening and assessment policies for asylum seekers in Germany. The second presentation will provide input from seminal research on public policy in migration contexts. A third presentation will summarize previous activities and insights of the work group "Economic arguments in migrant health policy making". The following discussion will examine the above noted questions by tapping into the presenters' expertise and the audience's experience. The workshop will be closed with a summary of lessons learnt and directions for future research.

Key messages:

- Economic arguments play a central role in policy-making; but economic analyses of different migrant health policy options are hampered by various methodological challenges and tensions.
- Seminal research in other social policy domains offers potential for mutual learning, toward the end of generating valid economic evidence on the cost-benefits of migrants' greater in-/exclusion.

The potential of economic evaluation studies to improve health screening and assessment policies for asylum seekers in Germany

Louise Biddle

L Biddle[1], K Wahedi[1], K Bozorgmehr[2,1]
[1]Working Group on Social Determinants, Equity and Migration, University Hospital, Heidelberg, Germany
[2]Working Group on Population Medicine and Health Services Res, Bielefeld University, Bielefeld, Germany
Contact: Louise.Biddle@med.uni-heidelberg.de

This presentation will discuss the potential for conducting economic evaluation studies in the field of migration and health, by focusing on health screening and assessment for newly arriving asylum seekers. We use three economic case studies from Germany to illustrate this potential, reflecting on the benefits of an economic approach, the contribution of modelling studies, the quality and reliability of the underlying data sources and other lessons learnt in the research process. Screening for illness among newly arriving individuals has the potential to expand access to essential services and overcome access barriers, thus improving efficiency by preventing costs of late presentations. This is demonstrated by a recent modelling study on the cost-utility of screening for depression. However, an overview of different screening policies in Germany shows that unnecessary procedures which are not supported by sound scientific evidence may lead to inefficiencies in excess of €3.1 million, which could be more effectively invested in other parts of the health system. Finally, efficiency gains could be made by assessing who benefits most from screening, and designing targeted screening approaches for these groups, as in the case of targeted screening for active tuberculosis by country of origin. We will end the presentation by reflecting on the potential role for economic evaluations health policy-making, and the challenges of communicating and translating the nuances of economic evidence into practice.

Effects of non-health-targeted policies on migrant health

Sol Juarez

SP Juarez[1], M Rostila[1]
[1]Department of Public Health Sciences, Stockholm University, Stockholm, Sweden
Contact: sol.juarez@su.se

This presentation will commence with a brief overview of the field of migration and health with the purpose of contextualizing the need for more policy-oriented research in this area, in so far as policy is a crucial -yet still overlooked- social determinant of health. In this context, we will present the main findings of a systematic review and meta-analysis recently published in the Lancet Global Health which looks at the effects of entry and integration policies on migrant health. The findings will, in turn, serve as a starting point to discuss how migration issues in general, and migration and health in particular, should be framed in relation to economic and human rights. Acknowledging the role of economic arguments in decision making, the presentation will end with a general reflection about the invisible contributions of migrants to wealth creation in a global economy and the difficulties of estimating such contributions.

Ethics, economics and migration: intersections, synergies and tensions

Ursula Trummer

U Trummer[1], N Gottlieb[2]
[1]Center for Health and Migration, Vienna, Austria
[2]Department of Health Care Management, Technical University Berlin, Berlin, Germany
Contact: ursula.trummer@c-hm.com

The presentation will provide food for thought on the relationships between value-based discussions and economic evaluations of healthcare provision for marginalized migrant groups along two different lines of thought. First, while economic analyses are often interpreted as objective and neutral pieces of evidence, it can be argued that every economic model and analysis has its starting point in specific ethical values that are set as basic assumptions. This, in turn, has inevitable impacts on possible results and conclusions. The presentation will use examples to illustrate the value-based foundations of economic analyses in migrant healthcare; and it will propose options for the more explicit reflection of value-based assumptions in economic evaluations. Secondly, the presentation will reflect on existing research on the rationales shaping political decision-making processes in the field of migrant healthcare. In specific, it will examine the concepts of ‘‘health-related deservingness’’ and of ‘‘political decisions’’, which both postulate that eventually values tip the scales in political decisions on migrant healthcare; and it will discuss the meaning of these concepts for the role of economic evidence in policy-making processes. In doing so, the presentation will relate back to the workshop’s overarching question on how to build synergies and bridges between migration and health research, economic analysis, and policy making to overcome inherent tensions.

9.C. Round table: Online anti-vaccination movements: the role of social media in public health communications

Organised by: EUPHA (HP), DPH, EUPHA (IDC)
Chair persons: Luís Saboga-Nunes - EUPHA (HP), Patty Kostkova - UK
Contact: caroline.wood@ucl.ac.uk

Digital health has revolutionised healthcare, with implications for understanding public reaction to health emergencies and interventions. Social media provides a space where like-minded people can share interests and concerns in real-time, regardless of their location. This can be a force for good, as platforms like Twitter can spread correct information about outbreaks, for example in the 2009 swine flu pandemic. However, social media can also disseminate incorrect information or deliberately spread misinformation leading to adverse public health sentiment and outcomes. The current issues around trust in vaccines is the best-known example. Vaccine hesitancy, traditionally linked to issues of trust, misinformation and prior beliefs, has been increasingly fueled by influential groups on social media and the Internet. Ultimately, anti-vaccination movements have the potential to lead to outbreaks of vaccine-preventable diseases, especially if refusal is concentrated locally, creating vulnerable populations. For example, 2018-19 saw a large increase in incidence of measles in the US and Europe (where cases tripled from 2017), two regions where the disease was already or almost eliminated. In 2019, the World Health Organisation listed anti-vaccination movements as one of the top 10 threats to global public health. HPV vaccination is another example of the impact of anti-vaccination movements. As viral videos originating on YouTube spread across social networks, uptake has tumbled in a number of countries, with Japan, Denmark, Colombia and Ireland being badly hit. In Japan, the government came under sufficient pressure that they de-recommended HPV vaccine, seeing an 80% uptake rate fall below 1% in 2014. There have been reports of successful interventions by national governments. A recent campaign run by the HPV Alliance (a coalition of some 35 private companies, charities and public institutions) in Ireland has seen rates below 40% back up to a national average of 75%. A combination of hard-hitting personal testimonials, social media and traditional media promoted the HPV vaccine. Despite this, systematic engagement and supranational strategies are still in the early stages of being formulated. As misleading information spread through social media and digital networks has undesirable impact on attitudes to vaccination (and uptake rates), urgent actions are required. Analysis and visualisation techniques mining data streams from social media platforms, such as Twitter, Youtube enable real-time understanding of vaccine sentiments and information flows. Through identification of key influencers and flashpoints in articles about vaccination going viral, targeted public health responses could be developed. This roundtable discussion will showcase different ways in which media and social networks, accessible in real-time provide an opportunity for detecting a change in public confidence in vaccines, for identifying users and rumors and for assessing potential impact in order to know how to best respond.

Key messages:

- Social media has significantly enhanced our understanding of anti-vaccination movements and potential impact on public health attitudes and behaviors regarding vaccination.
- Innovative methods of analysing social media data, from digital health, data science and computer science, have an important role in developing health promotions to counter anti-vaccination movements.

Role of Social Media in vaccination debate about HPV: the VAC Medi+Board study

Daniel Artus

D Artus[1], *H Larson*[2], *P Kostkova*[3]
[1]UCL Department of Geography, University College London, London, UK
[2]Department of Infectious Disease Epidemiology, LSHTM, London, UK
[3]UCL IRDR Centre for Digital Public Health in Emergencies, University College London, London, UK
Contact: dan.artus@ucl.ac.uk

Whilst it has long been known that anti-vaccination sentiment is widely disseminated through digital networks, 2019 has seen seismic shifts in the landscape. As viral videos originating on Youtube spread across social networks, HPV vaccine uptake tumbled in a number of countries. In Japan, the government came under sufficient pressure that they de-recommended HPV vaccine, seeing a 70% uptake rate in 2013 fall below 1%. However, there have been some reports of successful interventions - a recent campaign run by the HPV Alliance in Ireland has seen a rate back up to a national average of around 75%. A combination of hard-hitting personal testimonials, social media and traditional media looked to promote the HPV vaccine. Social media platforms such as Twitter enable near real-time understandings of vaccine sentiment and information flows at scale. VAC Medi+Board project developed an innovative approach for Twitter data collection, integration, analysis and visualisation to support rapid responses through identifying key influencers and flashpoints in articles about vaccination going viral. This pilot study evaluated the debate about HPV on Twitter in a period of several month and developed methods for analysis and visualisation of the content, key influencers, information diffusion throughout the network and size of audience. Through complex network analysis, VAC Medi+Board piloted identification of individuals for targeted public health interventions to combat misinformation. In this talk, we will present the VAC Medi+Board HPV study and explore the challenges and opportunities that social media can provide for public health policymakers.

Exploring online anti-vaccination movements: the role of social media in public health communications and reporting

Bolette Soborg

B Soborg[1]
[1]Centre of Evidence, Education and Emergency Services, Danish Health Authority, Copenhagen, Denmark
Contact: boso@sst.dk

Vaccination against Human Papilloma Virus (HPV) was successfully introduced in the Danish childhood vaccination program in 2009 for girls aged 12 with coverage reaching approximately 90%. However, media attention focusing on vaccine safety resulted in a rapid drop in vaccination coverage from 2015. In May 2017, a national campaign ‘‘Stop HPV - stop cervical cancer’’ with aim to regain trust in the official HPV vaccine recommendation and to increase vaccination coverage, was launched. The primary target group of the campaign are mothers in doubt whether to HPV vaccinate their daughter. One of the main elements of the campaign is the social media strategy which includes a Facebook (FB) page ‘‘Stop HPV - stop cervical cancer’’. New content is made for the page one or twice weekly with a wide range of different post styles used. The FB page is staffed throughout the week and every comment made on the FB page personally answered by the staff. The communication strategy used for the campaign is ‘‘heart-brain’’ with a strategy of communicating ‘‘brain’’ facts about safety and effectiveness of the vaccine while on the other hand telling narrative ‘‘heart’’ stories, such as personal stories of women with cervical cancer. The strategy is in line with recommendations from World Health Organization (WHO) who acknowledge health communication related to vaccines is not only about telling facts, but also about eliciting emotions, creating trust and ensuring genuine understanding by the target group. Communicating on FB about the Childhood vaccination programme has not been used by the Danish Authorities before and there has been a keen interest to learn from the campaign initiative. To quantify and qualify the interaction on Facebook, engagement rates and sentiment analysis to the different types of FB posts have been evaluated and focus groups used to describe the preferred communication style. Data from the evaluation and the impact of the campaign will be presented at the workshop.

Countering anti-vaccination trends and changing online opinion

Carlo Signorelli

C Signorelli[1,2], *A Odone*[2]
[1]Department of Biomedical and Biotechnological Sciences, University of Parma and Vita-Salute San Raffaele, Parma, Italy
[2]Faculty of Medicine, Universita Vita-Salute San Raffaele, Milan, Italy
Contact: signorellicarlo2307@gmail.com

We reported the case study of Professor Roberto Burioni, a medical microbiologist and virologist who, in 2015, started a personal social media campaign to contrast anti-vaccinists, using Facebook and other social media to disseminate the science behind vaccines and disseminating scientific data to refute rumors about their dangers. With over 500,000 people following his Facebook profile, Burioni has become a popular role model and influencer in the field of vaccines, openly criticizing vaccines’ refusers and fighting fake news. He used a rather aggressive tone, claiming they are ignorant and that ‘‘science is not a matter of democracy’’. Although it is methodologically difficult to quantitatively estimate the so-called ‘Burioni effect’ in influencing vaccines’ confidence, we report a drastic rebalance of the number of Italian social media pages supporting vaccines after 2015 suggesting his action on the web has been successful. In fact in 2015 Fakebook pages with the highest amount of contacts were anti-vax, while in 2018 pages with the highest number of contacts were those of supporting the scientific rationale of immunization. We are studying this phenomenon inside a project considering areas of Italy with high prevalence of no-vaxxers and hesitants.

The role of health literacy as a public health strategy to counter act the anti-vaccination movement in the web

Luís Saboga-Nunes

L Saboga-Nunes[1,2,3]
[1]ProLiSa, National School of Public Health, Universidade NOVA de Lisboa, Lisbon, Portugal
[2]Institute of Sociology, University of Education Freiburg, Freiburg, Germany
[3]Instituto de Saúde Ambiental, Universidade de Lisboa, Lisbon, Portugal
Contact: saboga.nunes@gmail.com

During the last three years information systems in Europe have shown an increase of cases related to certain diseases considered under control due to vaccination. In April 2017 ECDC reported 9 fatalities by measles and rubella outbreaks. More than 1500 cases of measles in 14 countries were reported in January and February (one of the worst outbreaks in recent years). In the first semester of 2018 in Europe 41 thousand more new cases were registered (17.073 more than in 2017). In Portugal during the first 4 months (2017) there were more cases of measles than during the last 10 years, and in 2018 new cases registered indicated a 5 times increase (162 cases), when compared with the previous year (2017). In Germany, 18% less vaccines were sold (significant drop between 2015 and 2016). It is essential to understand how health literacy is shaping social representations built around the anti-vax movement and the role of the media in their building process (e.g. Facebook / study case Portuguese community). We conducted a content analysis of Facebook pages related to ‘vaccines’ in Portuguese show that the first 2 hits are anti-vax pages with more than 4k likes while the first pro-vax Facebook page (from a nurse) has only one like. In the fourth rank with 43 likes, comes the first institutional Facebook pro-vax page. When considering health literacy of those involved in the dissemination of these messages, a clear mandate to public health stakeholders to become more engaged emerges as an urgent need. Public health is not visible on the web with the same intensity as anti-vax movements. A public health strategy should be based in a pro-active approach instead of being reactive to negative opinions about vaccinations.

9.D. Skills building seminar: Young policy voices for our future - building intergenerational bridges

Organised by: European Health Forum Gastein, EUPHA (PHPP)
Chair persons: Sara Mc Quinn - EUPHAnxt Co-ordinator, Damir Ivankovic - Netherlands
Contact: dorli.kahr-gottlieb@ehfg.org

Building bridges in policymaking is a vital concept to facilitate intersectoral collaboration and bring about change in many areas such as health workforce skill-mix, social and commercial determinants of health, or urgent health and environmental challenges with input from a wide spectrum of stakeholders. Yet, beyond breaking up horizontal silos, another issue urgently needs to be addressed: strengthening intergenerational bridges within the health policy arena. While valuing the younger generation's new ways of communicating and sharing innovative knowledge, systems which encourage intergenerational partnerships and foster a reciprocal exchange need to be facilitated. This will allow for young voices to be increasingly heard and considered in policymaking. Though young professionals in public health and beyond are ideally placed to move this collaboration forward with a perspective that is passionate, inquisitive, dedicated and unbound by paths already taken, these often hierarchical systems usually offer limited incentive and room for experimentation and innovation.

The objective of this interactive workshop is to highlight the need for incentivising intergenerational relations in policymaking and for young voices to be heard. We hope to inspire a fruitful intergenerational debate by presenting three case studies that display effective cross-generational work.

These insights will be followed by a participatory format allowing the participants to jointly consider and develop concrete suggestions on how increased intergenerational cooperation in the policymaking arena could be reached for the benefit of all, and to leave the room with innovative ideas to take home to implement in their work environments. The debate will not shy away from also critically reflecting the benefit of youth involvement and whether ''young voices'' can even be seen as one entity.

The three international cases showcased in this workshop will highlight how alternative non-hierarchical intergenerational models can be organised without threatening existing systems and enabling system transformation. Each case will focus on one of the headings:

1. Unexpected learning from intergenerational collaboration
2. Forming alliances for a stronger youth voice
3. Removing barriers for true intergenerational connection

The presentations will be followed by active audience involvement using the World Café, involving topic champions and allowing for participants to share their own experience, connect to current and future needs, and jointly develop ideas for action to be taken at different levels. The workshop will conclude with a 15 min plenary, where participants will share insights from their conversations. A graphic harvest will take place during the workshop to visually capture the spirit of the conversations, support knowledge sharing and inspire action.

Key messages:

- Developing alternative non-hierarchical inter-generational models.
- Building intergenerational bridges as a vital concept for future policymaking.

A fresh look at national health policy issues
Damiet Onderstal

D Onderstal[1]
[1]Public Health, Ministry of Health, Welfare and Sports, The Hague, Netherlands
Contact: damiet.onderstal@gmail.com

Young Forum Gastein (YFG), the young professionals' network of the European Health Forum Gastein (EHFG), enables promising young health professionals to become a part of an inspiring network of almost 500 members working in different positions all over Europe. In recent years, activities throughout the year have been focussed on workshops bringing together high-level national policymakers and Young Gasteiners (YGers) to discuss specific national health systems challenges in Austria and in Croatia. These formats have allowed a fresh look at issues senior policy makers may have developed a blind spot for, have resulted in eye-opening learning on both sides of the spectrum and have led to concrete recommendations for major health policy issues.

Presenters: Sinisa Varga, former Minister of Health, Croatia
Damiet Onderstal, Ministry of Health, Welfare and Sports, The Hague, Netherlands

For the benefit of young professional networks, please see also: https://academic.oup.com/eurpub/article/24/5/704/2837380

Youth Alliance - a new model for health policy development
Sherria Ayuandini

S Ayuandini[1]
[1]Department of Sociology, University of Amsterdam, Amsterdam, Netherlands
Contact: s.p.ayuandini@uva.nl

The work of the ''Youth Alliance'' (as part of the EU funded CO-CREATE project) introduces a new model for health policy development which sees young people and health policy experts from academia coalesce to form a 'Youth Alliance' considering the broader social and commercial environments which result in childhood obesity and other health problems, and what this means for policy development. The CO-CREATE project is a partnership between 14 European health and academic institutions and civil societies in five countries. The project will demonstrate the democratic engagement of youth in facilitating intergenerational and interorganisational cooperation.

Presenters: Christian Bröer and Sherria Ayuandini, University of Amsterdam

Young health leaders shape their future policies
Katarína Gatialová

K Gatialová[1]
[1]European Health Parliament, Brussels, Belgium
Contact: katarina@gatial.sk

The European Health Parliament (EHP) is a movement connecting and empowering the next generation of European health leaders to rethink EU health policies. The initiative connects promising young professionals and challenges them to develop solutions for European health policy that are both innovative and actionable. The EHP answers Europe's need for fresh ideas in health and believes that the solutions required must come from young European health leaders who influence the policies that will ultimately concern their generation as they become senior decision-makers. Participants work together for six months to develop policy recommendations that address today's most pressing European health issues which are picked in cooperation with the European Commission.

9.E. Workshop: The changing politics of ageing and welfare state: Connecting politics with realities

Organised by: Observatory
Chair persons: Scott Greer - USA, Jonathan Cylus - UK
Contact: slgreer@umich.edu

Societies are ageing, in Europe and elsewhere. This is an effectively unprecedented development in human history and one that many think could pose a real threat to welfare states' political bases and sustainability. In some countries this has been taken as evidence that the welfare state will become unsustainable, and in others that the welfare state has been turned to serve the interests of the elderly at the expense of the young.

The purpose of this workshop is to present the new evidence on how and why political systems respond to the challenges of ageing and health. Research indicates that the extent that population ageing creates difficulties for economies, public finances, and health systems is complex and, importantly, conditional on a host of modifiable factors. Furthermore, a focus on divides between generations distracts us from other, important, inequalities within generations. Not only does science have a part to play in busting many ageing-related 'myths', but there is also a key role for policy intervention.

This workshop, based on findings from the European Observatory's ''Economics of Healthy and Active Ageing'' study brings together research on why population ageing is often (erroneously) viewed cataclysmically from a health financing perspective, and reviews relevant policies that may improve health system financial sustainability. The workshop will have 5 presentations followed by debate on why countries may or may not prioritize policies that support the health of older people. Presentation #1 sets out the problems and broad trends on costs and projections associated with older people and ageing societies, drawing on the other parts of the series, as well as intergenerational transfers. It then lays out the framework for the rest of the presentations.

Presentation #2 expands on the first presentation by looking at country contexts. The focus will be on the politics and consequences of ageing in southern and central-eastern Europe. Having established the problem, Presentation #3 will determine how different publics understand and frame ageing and health, what priorities do publics identify, and why. Presentation #4 will look at political manifestos and voting patterns to see how/if public opinions are translating into changes in government that want to tear down the welfare state and blame it on ageing. Lastly, Presentation #5 will address the core issue obscured by intergenerational accounting: to what extent are the politics of ageing actually being shaped by, and reproducing, social inequalities?

Debate including audience members will be facilitated by an expert from the Observatory.

Key messages:

- Excessive focus on the costs of ageing is a distraction from real inequalities and an obstacle to better policy.
- Institutional and policy responses play a crucial role in determining how health systems, economies and societies more broadly are affected by population ageing.

Busting the myth of the 'greedy elderly'

Julia Lynch

J Lynch[1]
[1]Department of Political Science, University of Pennsylvania, Philadelphia, USA
Contact: jfl@sas.upenn.edu

Background:

The politics of ageing are both personal, involving judgements about specific family members as well as broad social groups. This chapter evaluates the argument that governments implement packages of policies that are favorable to the elderly, but that are societally sub-optimal, because of political pressure from the elderly. It begins by laying out the core premises of the ''greedy geezer'' narrative: because pension transfers, high-cost medical care, and policies that protect transferable assets like housing are highly salient to the elderly and their advocates, intense preferences for these types of policies communicated to politicians and policy-makers will eventually crowd out other, more societally-optimal policies.

Methods:

Looking at public opinion data on ageing, intergenerational transfers, and the welfare state this chapter wants to understand both how different publics understand and frame ageing and health as well as what priorities these publics identify, and why?

Results:

The elderly and their organized representatives (e.g. pensioner parties, pensioner unions, and advocacy groups) in some contexts do push for policies that are ''greedy'' in the sense of being beneficial for the elderly or their own children, but not for society as a whole. However, this phenomenon is far from universal: It is especially pronounced in the US and the UK, but much less so in other national contexts. Moreover, the policy packages adopted by national governments are generally motivated by concerns other than appeasing the elderly.

Conclusions:

Characterizing the elderly as uniformly ''greedy'' obscures the fact that inequality among the elderly means that many need more support than they actually receive.

Taking the high road: The politics of win-win approaches

Jane Gingrich

J Gingrich[1]
[1]Department of Politics, Oxford University, Oxford, UK
Contact: jane.gingrich@politics.ox.ac.uk

Background:

Policy is rarely a direct reflection of public opinion. Party systems and patterns of political competition shape the way issues are presented in politics and the incentive politicians have to act on them. Despite the alleged pro-elderly bias of many political institutions in European countries, and the potential for some types of spending on the elderly to provide broader social benefits, policymakers often do not introduce the most effective policies for supporting healthy ageing.

Methods:

Political manifestos and voting patterns will be examined in order to determine how/if public opinions are translating into changes in government that want to tear down the welfare state and blame it on ageing.

Results:

Although it is true that public spending (e.g. pensions, health) on the elderly remains more extensive and insulated from cuts than other forms of spending, second, in many (not all) countries policies that would help the elderly age in a healthy way are to introduced. These latter policies, which include spending on the poorest elderly, ensuring access to high quality home care and other services, and investing in declining regions where elderly people are often disproportionately likely to live, often are limited.

Conclusions:

Where cross-class/cross-generational coalitions come together to address gender inequities (among the elderly and working age), and develop public services, high road models are possible. Where conflict is framed largely inter-generationally, the well-being of pensioners may be preserved in the short-run, but less investment in the long-run infrastructure of healthy ageing emerges. To make these arguments, the paper shows descriptive patterns of policy developments from the 1980s to today, combined with a brief case study of the UK.

The real inequalities

Clare Bambra

C Bambra[1], *A Reeves*[2]
[1]Public Health, Newcastle University, Newcastle, UK
[2]Social Policy and Intervention, Oxford University, Oxford, UK
Contact: clare.bambra@newcastle.ac.uk

Background:

The 'greedy geezer' and 'poor elderly' narratives both assume that the older population are homogeneous and that the experiences of older people are universal. This ignores the fact that there are significant health inequalities (i) amongst the older population and (ii) in terms of who gets to be 'old' (and for how long). Further, the focus on intergenerational inequality is a deliberate distraction from the far more significant health inequalities that exist in terms of gender, geography, ethnicity, socio-economic status etc across the whole population - regardless of age.

Methods:

Health inequalities amongst the older population and inequalities in terms of who gets to be 'old' will be examined through health inequalities across the population by gender, geography, ethnicity, socio-economic status etc.

Results:

Given, for example, that total intergenerational transfers incorporating private transfers are from the older to the younger, it is quite possible that if we reduce public intergenerational transfers (working age to older) then all we are doing is increasing inherited inequality.

Conclusions:

Policy focused on 'intergenerational equity' and 'intergenerational accounting' will often exacerbate inequalities within generations, to the benefit of the wealthiest and the detriment of much of the population. Win-win solutions only emerge if there is a focus on addressing the many and more profound health inequalities that cross-cut generations.

The politics of bad policy: Why don't governments pick win-wins?

Michelle Falkenbach

M Falkenbach[1,2], *SL Greer*[1,2]
[1]Health Management and Policy, University of Michigan, Ann Arbor, USA
[2]European Observatory on Health Systems and Policies, WHO, Brussels, Belgium
Contact: michfalk@umich.edu

Background:

Why, fundamentally, are the politics and public opinion of ageing and health so badly mis-aligned with facts about the costs of ageing societies? The literature has for decades characteristically divided between an old politics of expansion and the post-1990s new politics of recalibration and austerity. The problem for understanding the politcs of health and ageint is that a mix is also plausible: recalibration with an element of expansion in long term care. This mix then leads to a further thought: When do governments expand mature welfare states to deal with risks not covered in traditional male-wage-earner welfare programs?

Methods:

A narrative review was conducted on the thin literature available attempting to answer the question as to why governments are not picking win-wins (e.g. keep people healthy so they can actually retire at their formal retirement ages, or ensure informal care is valued).

Results:

There were a handful of hypotheses identified in the review, including: the "old politics" of welfare expansion where "credit claiming" is used for highly popular initiatives, the "new politics of the welfare state" also known as the "blame avoidance thesis" where politicians will attempt to avoid blame by making cuts less transparent, "blame buffering" and the "median voter theory" as well as "negative policy feedback".

Conclusions:

Mature welfare states are not expanding. In fact, the theories on the politics of ageing are focused on how welfare states are retrenching or reforming, as they call it. Blame avoidance and blame buffering are the most common explanations for decisions, often counterproductive ones, about how to recalibrate welfare states in the face of ageing.

9.F. Workshop: Twins: a powerful study design to examine the role of genetics and environment for work incapacity

Organised by: Karolinska Institutet
Chair persons: Pia Svedberg - Sweden
Contact: pia.svedberg@ki.se

Twin design is an important tool to analyze the role of genetic and environmental factors, and to better understand causal mechanisms in public health research. Twin studies have reliably shown that genetic factors are important not only for physiological traits but also for psychological and health behavioral traits as well as for health-related work incapacity in terms of sick leave and disability pension.

As many countries face an aging workforce, it is becoming ever more important to understand the underlying causes of work incapacity across the entire working life. In the past decade, twin data in combination with national register data have been used to deepen our understanding of the role of genetic and environmental influences on the complex processes of sick leave and disability pension. The aim of this workshop is to present and discuss methods and results of studies based on the large Swedish, Finnish and Norwegian twin cohorts.

Linear structural equations are intensively utilized in modern methods of twin studies. A variety of models are available to answer different research questions, such as the dynamics behind associations between traits and developmental processes in longitudinal designs - models also applicable in health at work and social security. Further, analyzing twin pairs discordant for an outcome or risk factor (co-twin control) provides a unique possibility to control for familial (genetic and shared environmental) factors, since cases and controls are matched optimally being twins. Findings based on twin cohorts suggest that familial factors are relevant to many risk factors as well as for work incapacity. By controlling for these unobserved confounding factors, the co-twin control design may provide more accurate estimates of risk factors for work incapacity and complement the epidemiological findings of unrelated subjects. Based on population-based twin cohort studies with long follow-up, indications also exist that familial confounding may have different roles in the associations between risk factors and work incapacity. For example, in regard to various disability pension diagnosis groups and depending on study designs (one vs. two time points, longer vs. shorter follow-up etc.).

Results from prospective studies on various risk factors, including adolescents' mental health problems, for future sick leave and disability pension will be presented. Another presentation focuses on the stability and change in genetic and environmental factors influencing work incapacity from age 18 until retirement and the likelihood of causality between educational attainment, lifestyle and work incapacity. Finally, results on adverse outcomes of sick leave due to mental disorders using an open cohort design adjusting for familial factors will be presented.

During the time of rapid development in molecular genetics, the twin study design has maintained its importance and will continue to cast light on different aspects of work incapacity.

Key messages:

- Twin design offers a unique tool in public health research to examine and control for familial (genetic and shared environmental) factors.

- Genetic factors seem to play an important role in understanding the complex causes of work incapacity in terms of sick leave and disability pension.

Studies from the Norwegian Twin Registry on risk factors for health related work incapacity

Ragnhild Elise Orstavik

R Orstavik[1], *K Seglem*[2], *LC Gjerde*[2,3], *F Torvik*[2,3,4], *E Røysamb*[3,5], *T Reichborn-Kjennerud*[2,6], *M Vollrath*[1,3]
[1]Department of Mental Health and Suicide, Norwegian Institute of Public Health, Oslo, Norway
[2]Department of Mental Disorders, Norwegian Institute of Public Health, Oslo, Norway
[3]Department of Psychology, University of Oslo, Oslo, Norway
[4]Centre for Fertility and Health, Norwegian Institute of Public Health, Oslo, Norway
[5]Department of Child Health, Norwegian Institute of Public Health, Oslo, Norway
[6]Institute of Clinical Medicine, University of Oslo, Oslo, Norway
Contact: reor@fhi.no

Background:

For the past decade, researchers from the Nordic countries have taken the advantage of their large twin cohorts and reliable official registries to deepen our understanding of sick leave and disability pension. This presentation will give a brief summary of studies based on data from The Norwegian Twin Registry (NTR).

Methods:

Monozygotic twins develop from one fertilized egg cell and are genetically identical, while dizygotic twins are the result of two fertilized egg cells and share, as ordinary siblings, in average 50% of their segregating genes. With data from large cohorts of twins reared together, it is possible to calculate the proportion of variance in an outcome that stems from genetic, shared and non-shared environmental factors respectively. Furthermore, when exploring the contribution from measured risk factors on specific outcomes, adjustment for unmeasured confounders (genes and shared environment) can bring us closer to determine causality in epidemiological studies. Both methods were applied in our studies. NTR now includes data from about 30 000 twins, but until recently we focused on a subsample of about 8 000 young adults (born 1967-1979). Data from questionnaires and interviews were linked to registries on sick leave and disability pension.

Results:

In line with previous studies, we found that the liability to sick leave and disability pensioning, as well as the transition from the former to the latter, was strongly to moderately influenced by genetic factors. We found no evidence for ''social transmission'', e.g. that environmental factors shared by the twins contributed to these outcomes. Further details and results from studies on measured risk factors, with emphasize on mental health, will be presented at the conference.

Conclusions:

Twin studies cast light on different aspects of work incapacity, including reducing stigma such as those associated with theories of social transmission of health related benefits.

Risk factors of disability pensions – what will twin studies from Finland and Sweden add?

Annina Ropponen

A Ropponen[1,2], *P Svedberg*[2]
[1]Finnish Institute of Occupational Health, Helsinki, Finland
[2]Division of Insurance Medicine, Karolinska Institutet, Stockholm, Sweden
Contact: annina.ropponen@ttl.fi

Background:

Finland and Sweden have been forerunners to investigate social insurance in twin cohorts. Using twin cohorts to research disability pension (DP) has provided a unique possibility to control for genetic and environmental factors (i.e. familial confounding). This is important, since genetics is known to play an important role in many chronic diseases for DP such as low back pain (30%), depression (40%) and a moderate (35-48 %) role in DP. Furthermore, familial confounding can be expected to affect many risk factors, i.e. health and behavior related factors and is therefore of interest in the associations between risk factors and DP.

Methods:

In twin cohort studies for DP, first, the twins are treated as singletons, and the effect of risk factors on the incidence of DP is analyzed by applying regression models. Second, analyzing twin pairs discordant for both outcome (DP) and risk factors provides a possibility to control for familial confounding. This co-twin-control design is a unique tool, includes investigation whether twins who are exposed to a specific factor of interest more often are granted a DP than their non-exposed co-twins.

Results:

Co-twin control design allows adjustment for familial confounding. Therefore, the results based on discordant twin pairs add to the epidemiological findings of unrelated subjects. Based on population-based twin cohort studies with long follow-up, indications exist that the familial confounding may have different role in the association between risk factors and DP depending on risk factors of interest but also on diagnosis group for DP.

Conclusions:

Evidently the underlying medical condition is important, and the risk factors vary between diagnosis groups of DP. However, also familial factors play a role in process of sickness absence, in the transition from sickness absence to DP, and for DP. Therefore, need for early identification of risk factors and tailored interventions of prevention is emerged for public health.

Mental health in childhood and adolescence in association to sickness absence and disability pension

Jurgita Narusyte

J Narusyte[1], *R Amin*[1], *A Ropponen*[1,2], *P Svedberg*[1]
[1]Division of Insurance Medicine, Karolinska Institutet, Stockholm, Sweden
[2]Finnish Institute of Occupational Health, Helsinki, Finland
Contact: jurgita.narusyte@ki.se

Background:

A large amount of studies have previously reported associations between sociodemographic, socioeconomic, health- and work-related factors and future sickness absence (SA) or disability pension (DP). However, the knowledge is still scarce regarding the associations between mental health problems and disorders during childhood and adolescence in association to future work incapacity, and regarding the role of familial influences on the associations.

Methods:

The studies were based on 2,690 twins born 1985-1986 in Sweden who participated in the Twin Study of CHild and Adolescent Development (TCHAD). The twins were followed repeatedly at ages of 8-9, 13-14, 16-17, and 19-20 years. The presence of depressive, anxiety, rule-breaking, and social phobia symptoms were assessed through self-reports. SA and DP data were obtained from national registries. Group-based trajectory, logistic regression and Cox proportional regression analyses were applied.

Results:

More than half of the twins that were on SA or granted DP had stable moderate levels of the mental health symptoms during adolescence. Cox regression analyses showed that rule-breaking behavior was associated with a higher risk for SA with the highest HR of 1.12 (95% CI 1.05-1.19) at age of 8-9 years. High levels of anxious and depressive symptoms were associated with DP despite age at symptom assessment. The associations attenuated slightly when familial factors were taken into account. The association between social phobia and SA was to some extent explained by sex and parental education except for when social phobia was measured at ages 19-20 years (OR 1.22, 95% CI 1.10-1.34). The results changed slightly when further adjusting for familial factors.

Conclusions:

Familial factors had no major importance for the studied associations. Hence, early life public health interventions to improve mental health might reduce the risk of future work incapacity in young adulthood.

Education, lifestyle and life course differences in level of work incapacity – genes and environment

Karoline Brobakke Seglem

K Seglem[1], F Torvik[1,2,4], E Røysamb[3,4], LC Gjerde[1,4], P Magnus[2], T Reichborn-Kjennerud[1,5], P Svedberg[6], R Ørstavik[7], M Vollrath[7]

[1]Department of Mental Disorders, Norwegian Institute of Public Health, Oslo, Norway
[2]Centre for Fertility and Health, Norwegian Institute of Public Health, Oslo, Norway
[3]Department of Child Health, Norwegian Institute of Public Health, Oslo, Norway
[4]Department of Psychology, University of Oslo, Oslo, Norway
[5]Institute of Clinical Medicine, University of Oslo, Oslo, Norway
[6]Division of Insurance Medicine, Karolinska Institutet, Stockholm, Sweden
[7]Department of Mental Health and Suicide, Norwegian Institute of Public Health, Oslo, Norway
Contact: karoline.seglem@fhi.no

Background:

As many countries face an aging workforce, it is becoming ever more relevant to understand the underlying causes of work incapacity across the entire working age. Previous twin studies have demonstrated that work incapacity is influenced by genetic as well as environmental factors. Furthermore, educational attainment and lifestyle behaviors are relatively stable from early adulthood and are associated with work incapacity. This association may be confounded by unobserved factors - both genetic and environmental. In two separate twin studies, we examine 1) the stability and change in genetic and environmental factors influencing work incapacity from age 18 until retirement, and sex differences in these effects, and 2) the associations and likelihood of causality between educational attainment, lifestyle and sickness absence.

Methods:

study 1: A population-based sample of 28,759 twins were linked to high quality national registry data and followed for up to 23 years. We measured work incapacity as the total proportion of potential workdays lost due to sickness absence, rehabilitation, and disability benefits.

study 2: Data from a subsample of 8,806 twins who completed health questionnaires were linked to registry data on sickness absence and educational attainment. Self-reported lifestyle behaviors were smoking, physical activity and BMI (height and weight).

Results:

study 1: Structural equation modeling indicated moderate genetic influences on work incapacity throughout life in both men and women, with a high degree of genetic stability from young to old adulthood.

study 2: Preliminary regression analyses indicated that genetic factors largely confound the associations between educational attainment, lifestyle and sickness absence.

Conclusions:

Genetic factors seem to be a major issue in understanding causes of work incapacity. Largely the same genetic factors influence individual differences in work incapacity throughout working age.

Adverse outcomes of sick leave due to mental disorders: prospective studies of discordant twin pairs

Lisa Mather

L Mather[1], J Narusyte[1], A Ropponen[1], G Bergström[2,3], V Blom[1,4], B Helgadóttir[1], P Svedberg[1]

[1]Division of Insurance Medicine, Karolinska Institutet, Stockholm, Sweden
[2]Institute of Environmental Medicine, Karolinska Institutet, Stockholm, Sweden
[3]Centre for Musculoskeletal Research, Department of Occupational and Public Health Sciences, University of Gävle, Gävle, Sweden
[4]The Swedish School of Sport and Health Sciences, Stockholm, Sweden
Contact: lisa.mather@ki.se

Background:

Sick leave due to mental disorders is common. We investigated if sick leave due to mental disorders increased the risk of reoccurring sick leave, disability pension, unemployment, in- and specialized outpatient care, and mortality, using a co-twin design, taking genetics and shared environment (familial factors) into account.

Methods:

The register-based open cohort studies contained twin pairs 18-64 years old discordant for sick leave due to a mental disorder. First, 2202 pairs were followed up to 8 years from the end of the sick leave spell for reoccurring sick leave, disability pension and unemployment. Second, 4979 twin pairs were followed up to 9 years from the beginning of the sick leave spell for death, inpatient and specialized outpatient care. Conditional Cox proportional hazard regression, adjusting for familial factors, was used to calculate Hazard Ratios (HR) with 95% Confidence Intervals (CI).

Results:

Those with sick leave due to mental disorders had 3.64 (CI: 3.24-4.08) times higher risk of reoccurring sick leave the first two years and the first year, they had 12.24 (CI: 8.11-18.46) times the risk for disability pension. The risk of unemployment was 1.99 (CI: 1.72-2.31). The HR for inpatient care was 1.90 (CI: 1.66-2.17) among men but lower among women. For men the risk of outpatient care was higher the first 2 years (HR: 2.08, CI: 1.87-2.31), and for women the HR was 1.57 (CI: 1.47-1.68) for the whole study time. There was an increased risk of death among men (HR: 2.91, CI: 1.70-4.99), but not among women.

Conclusions:

By adjusting for familial factors we could investigate if the same factors that predispose to sick leave due to mental disorders also predispose to morbidity, mortality and unemployment and hence explain the associations. But, sick leave due to mental disorders was associated with a higher risk of work related and health outcomes, independent of familial factors. The risks varied over time and differed among women and men.

9.G. Skills building seminar: Capacity-building for implementing integrated care

Organised by: Scottish Government, EUPHA (CHR), Chair persons: Iveta Nagyova - EUPHA (CHR), Andrea Pavlickova - UK
Contact: andreapavlickova@nhs.net

Rationale:

The significance of integrated care as a means for improving health outcomes and effectiveness and sustainability of health and care systems is widely acknowledged. Integrated care is a central element in many on-going or planned healthcare system reforms, however, the main challenge remains of how to build relevant capacity and know-how for the successful implementation of integrated care. Capacity-building is both the foundation and aspiration of SCIROCCO Exchange EU Health Programme funded project. The project aims to facilitate access to tailored, evidence-based support and improvement planning by recognising different staring points, or levels of maturity of healthcare systems in Europe.

Objectives:

This round table aims to explore different levels of local maturity and capacity to implement integrated care in three European regions; Basque Country, Flanders and Poland. The workshop will be a practical opportunity to dispute what actions and activities should be prioritised in these regions in order to improve their capacities for the adoption and scaling-up of integrated care. The workshop also aims to raise awareness about different levels and mechanisms of capacity-building support for integrated care that exists at European level. In particular, the workshop will feature SCIROCCO Exchange Knowledge Management Hub as one of the capacity-building tools and its application in the real-life settings.

Added value:

Sharing learning more widely will help to build sustainable integrated care systems and tackle the risks of people working in isolation or re-inventing the wheel.

Format of the workshop:

The workshop will consist of two keynote presentations, providing necessary background into the existing European policies, programmes and initiatives to support the adoption and scaling-up of integrated care. The introductory presentations will then follow by three snapshot presentations of 5 minutes featuring the main findings on the maturity and capacity of three European regions to implement integrated care. In the second part of the meeting, the participants will have the opportunity to discuss interactively with the representatives of the regions the use of SCIROCCO Exchange Knowledge Management Hub in the real-life settings, its added value and implications of the outcomes for future actions and improvement planning. The ultimate objective is to stimulate the discussion and knowledge on how to address the existing difficulties in implementing integrated care.

Key messages:

- Integrated care is considered as fundamental element driving transformation of healthcare systems. The challenge remains how to address different levels of capacities to implement integrated care.
- SCIROCCO Exchange can facilitate the access to capacity-building support that is needed for transition and/or improvement of existing systems for the adoption and scaling-up of integrated care.

EU level actions and instruments to support the implementation of integrated care

Lokianos Gatzoulis

L Gatzoulis[1]
[1]DG SANTE, European Commission, Brussels, Belgium
Contact: loukianos.gatzouils@ec.europa.eu

Issue/Problem:

The significance of integrated care as a means for improving health outcomes and the effectiveness and sustainability of health and care systems is acknowledged in several policies at national and EU level, for example: the European Commission's Communication on effective, accessible and resilient health systems, the 2017 European Semester: Communication on Country Reports, the Joint Report on Health Care and Long-Term Care Systems and Fiscal Sustainability by the European Commission and the Economic Policy Committee, the Companion Report 2017 of the State of Health in the EU and the most recent Commission Communication on the digital transformation of health and care in the Digital Single Market. As such, there may be no doubt about whether one needs to transform the health and care model and move to integrate care, but the question is how to design and implement integrated care successfully. One pre-condition for this to happen, is for health authorities to have adequate capacity and relevant know-how.

Results:

The European Commission aims at assisting Member State authorities at national, regional and local levels to fulfil this pre-condition and proceed with their health system reforms. There is a number of instruments, initiatives and funding support to raise the capacity of national and regional healthcare authorities to adopt and scale up integrated care.

Lessons:

There is an increasing demand and need to provide support and assistance to Member states to drive the transformation of healthcare systems towards more coordinated, integrated and sustainable healthcare systems.

SCIROCCO Exchange - Capacity-building support for integrated care

Andrea Pavlickova

A Pavlickova[1]
[1]Technology Enabled Care and Digital Healthcare Innovation, Scottish Government, Edinburgh, UK
Contact: andreapavlickova@nhs.net

Issue/Problem:

Integrated care is a recognised solution to address the challenge of ageing population. Hence, it is important to commit to opportunities that increase the readiness and capacity of regions to implement integrated care. Knowledge transfer has been greatly recognised as an effective enabler of capacity-building support. However, effective knowledge transfer and capacity-building support requires dedicated support and infrastructure to ensure that the flow of appropriate information and knowledge between adopting and transferring entities is tailored to the local context and maturity of the particular healthcare system seeking the support. This is a precondition to help health and care authorities to build their capacity for the successful transition towards integrated care.

Results:

A key aspect of the SCIROCCO self-assessment tool is that of context and transferability. In particular, the Tool considers the context in which an integrated care solution has been developed and context into which that solution will be transferred. The Tools also helps to understand the maturity of local conditions enabling the adoption and scaling-up of integrated care and inform about the strength and weaknesses of particular region and organisation in integrated care. This in turn informs about the priorities improvement and focus of the capacity-building support.

Lessons:

The experience of regions in using the SCIROCCO tool to facilitate knowledge transfer and capacity-building support demonstrates the clear benefits of the tool in stimulating multi-stakeholder involvement and learning on future directions of integrated care and transformation of health and care delivery systems in Europe.

Maturity of integrated care in Scotland - What can we learn?

Stuart Anderson

S Anderson[1]
[1]Department of Informatics, University of Edinburgh, Edinburgh, UK
Contact: soa@staffmail.ed.ac.uk

Issue/Problem:

Multiple chronic conditions and the complexity of needs arising from them demands a rethinking of delivery systems, innovation, and resourcing. Tools and methodologies that help understand these complex transformational processes and orchestrate discussions of all stakeholders involved are core to this process. As a result, Scotland was keen to apply SCIROCCO tool to assess their readiness for integrated care.

Results:

The application of SCIROCCO self-assessment tool showed a range of strengths and weaknesses of Flanders region to adopt and implement integrated care. More than 15 stakeholders were involved in this process which proved the importance and added value to the assessment process. In addition, the outcomes of this process help to identify the potential focus of the capacity-building support.

Lessons:

SCIROCCO tool is a very useful participatory tool which can help to drive the transformational change towards integrated care.

Maturity of integrated care in the Basque Country - What can we learn?

Jon Txarramendieta Suarez

J Txarramendieta[1]
[1]International Department, Kronikgune, Bilbao, Spain
Contact: jtxarramendieta@kronikgune.org

Issue/Problem:

The need for sustainable resourcing drives professionals, end-users and the wider public and private sectors to draw on their experience and expertise to meet those needs. Tools and methodologies that help understand these complex transformational processes and orchestrate discussions of all stakeholders involved are core to this process. As a result, Basque Country was keen to apply SCIROCCO tool to assess their readiness for integrated care.

Results:

The application of SCIROCCO self-assessment tool showed a range of strengths and weaknesses of Basque Country to adopt and implement integrated care. More than 15 stakeholders were involved in this process which proved the importance and added value to the assessment process. In addition, the outcomes of this process help to identify the potential focus of the capacity-building support.

Lessons:

SCIROCCO tool is a very useful participatory tool which can help to drive the transformational change towards integrated care.

Maturity of integrated care in Poland - What can we learn?

Katarzyna Wiktorzak

K Wiktorzak[1]

Issue/Problem:

The need for sustainable resourcing drives professionals, end-users and the wider public and private sectors to draw on their experience and expertise to meet those needs. Tools and methodologies that help understand these complex transformational processes and orchestrate discussions of all stakeholders involved are core to this process. As a result, Poland was keen to apply SCIROCCO tool to assess their readiness for integrated care.

Results:

The application of SCIROCCO self-assessment tool showed a range of strengths and weaknesses of Poland to adopt and implement integrated care. More than 15 stakeholders were involved in this process which proved the importance and added value to the assessment process. In addition, the outcomes of this process help to identify the potential focus of the capacity-building support.

Lessons:

SCIROCCO tool is a very useful participatory tool which can help to drive the transformational change towards integrated care.

9.H. Workshop: National approaches to Public health; policy, strategies, legislation and implementation in Europe

Organised by: Federal Centre for Health Education, Robert Koch Institute, Future Forum Public Health, Germany
Chair persons: Yvette Shajanian Zarneh - Germany, Svenja Matusall - Germany
Contact: yvette.shajanian-zarneh@bzga.de

Background:

During the past decades, the growth of knowledge to prevent disease on the one hand and the growth of public acceptance to prevent disease on the other hand led to form public health systems. Soon after, health was no longer considered as an individual responsibility only, and more effective interventions against health threats and communicable diseases were developed. As a result, public agencies and authorities were established to implement newly discovered interventions against health threats and to prevent non-communicable diseases.

Though, the orientation of public health agencies and authorities shifted from prevention of disease to promotion of health in almost all countries, their public health systems are developed widely differently. While some countries look back to traditionally established public health systems, others are pursuing different approaches to achieve Health in All Policies through policy and legislation in Wales or are now evaluating their public health policies after a ten-years-strategy, like Sweden and still others have only recently (2015) introduced a new Preventive Health Care Act and follow a bottom up approach called ''Future Forum Public Health'', like Germany.

Objectives:

This workshop aims at presenting the very different perspectives on the achievement of public health and different systems around Europe. Both, the disparity of the approaches and their different forms, and different stages of their development will be addressed by each presentation. Despite differences of the public health systems in each context, the workshop will focus on identifying shared features and common challenges of the countries with the goal of identifying inspiring examples and discussing criteria of transferability. During the discussion that will follow, different possibilities of cooperation and exchange will be assessed and debated.

In particular, the workshop will encompass a presentation from Wales on ''the future generation's act'' and will include information on the requirements to turn the legislation into practice. The Swedish input will focus on the Swedish national public health policy and its achievements after ten years. France will give an overview of the structural developments during the last ten years. The presentation from Germany will consist of contrasting a top-down and a bottom-up approach, namely the act to strengthen health promotion and prevention in Germany on the one hand and the future forum public health on the other hand. And last but not least, we will hear about the particular success of the Slovenian example with a newly shaped and largely developed public health system.

Key messages:

- Acquiring insight into different approaches to achieve improvements in public health based on alternative systems is important to identify inspiring examples, shared features and common challenges.
- Identification of criteria of transferability of public health strategies, legislation and policies between countries, and requirements for implementation are crucial for learning from best practice.

The preventive health care act and the future forum public health in Germany

Freia De Bock

F De Bock[1], *Y Shajanian Zarneh*[2], *S Matusall*[3]
[1]Department Effectivity and Efficient of Health Ecuda, Federal Centre for Health Education/BZgA, Cologne, Germany
[2]Unit International Relations, Federal Centre for Health Education/BZgA, Cologne, Germany

[3]Robert Koch Institute, Berlin, Germany
Contact: freia.debock@bzga.de

The public health system in Germany, similar to education and cultural affairs, is characterised by the federal structure. It is mainly regulated and decided at the state and municipal level, and not primarily at the national level.

The preventive health care act (The Act to Strengthen Health Promotion and Preventive Health Care) (2015) underlines the setting-based approach of health promotion and takes a life course perspective by recommending goals of growing up healthy, living and working healthy and healthy ageing. The act formulates broad recommendations for prevention and health promotion at the national level, that in turn take on concrete forms in mandatory framework agreements at the federal state level with uniform health objectives. On the whole, the key objective of the act is to improve preventive health care and general health promotion. Also the financing of the act by the mandatory health insurance is a special feature and at the same time a novelty.

At the same time a bottom-up project has been recently launched with the aim to develop a public health strategy in Germany. The project future forum public health (ZfPH) is a platform for public health professionals, researchers and students following incorporated concepts of policy analysis as well as methods that will ensure participation, transparency and transferability of the results into policy and practice. Over the next three years, ZfPH's steering group will moderate a participatory process, including stakeholders from public health practice and research as well as policy makers. In an evidence-based approach, they will first analyse the current state of Germany's public health system before developing concrete policy recommendations for a coherent and efficient public health system.

The presentation will give a short overview over the German public health system and the preventive health care act, its structure and the achievements as well as the bottom-up project future forum public health.

The future generation's act: Wales

Catherine Weatherup

C Weatherup[1]
[1]Public Health Wales, Cardiff, UK
Contact: Catherine.Weatherup@wales.nhs.uk

The Wellbeing of Future Generations (Wales) (WFG) Act 2015 is ambitious legislation that enables a step change in the way public services tackle health and societal problems. The WFG Act includes clear requirements for public bodies to share a common purpose, by setting seven wellbeing goals focused on improving social, economic, environmental and cultural wellbeing. The Act requires public bodies to act collectively, plan for the long-term, involve people and communities in decision making, prevent problems occurring and take a joined-up approach to assessing wellbeing and planning. Monitoring and accountability structures include the establishment of a Future Generations Commissioner, whilst progress is monitored and reported against using National Indicators and reporting as part of the UK to the United Nations International Sustainable Development Goals. The Act represents a milestone for public health, with health and equality goals on par with goals for the environment and economy and a clearer articulation of the social and economic determinants of health. The presentation will provide a short introduction to the background and development of the legislation, but the main focus will be on what is being done to drive and support implementation at various levels of operation; for individuals, for teams, for organisations and for government and systems in order that the potential reach of the legislation is realised.

The Swedish national public health policy and its achievements after ten years

Nina Lindqvist

N Lindqvist[1]
[1]The Public Health Agency of Sweden, Stockholm, Sweden
Contact: nina.lindqvist@folkhalsomyndigheten.se

Public health issues and their equality aspects have been on the political agenda in Sweden since the early 1980s. Already in the 1990s, the Government presented the first public health policy bill. This highlighted the conditions for a sustainable development from a public health perspective. Increased equality was set to be the overriding objective in prioritizing public health work and that priority should be given to efforts that would improve the situation of the most disadvantaged.

The foundation of today's public health policy was laid in 2003 when the parliament decided on a new bill in which an overall goal for national public health policy was established: 'Creating social conditions for good health on equal terms for the entire population'. The bill also established a cross-sectoral target structure for the overall public health work with eleven target areas. It also pointed out that public health policy is cross-sectoral and must be a part in all policy areas. In June 2008, the parliament adopted the bill A Renewed Public Health Policy. Changes made were (among other things) a rewording of the target areas, but many of the starting points were kept.

The Swedish Commission for Equity in Health was set up in 2015 and given two main tasks, to produce a proposal that can help to reduce the health inequalities in society and to work for raised awareness of health inequalities in society and among stakeholders. The work of the commission was finished in 2017 and presents an analysis of how the public health policy works in practice, with regard to the intentions of policy framework. A number of problems or areas of development appear which the Commission considers need to be addressed.

The presentation will first give a short overview of the Swedish public health policy from 2008 and will then present the commission's conclusions and proposals for development areas.

Slovenian PH system: reshaping and new approaches to interventions and linkages with primary care

Tit Albreht

T Albreht[1], *R Pribakovic Brinovec*[2], *M Gabrijelcic*[2]
[1]Centre for Health Care, National Institute of Public Health, Ljubljana, Slovenia
[2]National Institute of Public Health, Ljubljana, Slovenia
Contact: Tit.Albreht@nijz.si

Slovenia's public health started a new era of proactive interventions jointly with primary care since early 2000s, based on the heritage of the outreach approach developed in that territory in early 1930s. The National Programme for the Early Detection of Risk Factors for Cardiovascular Diseases was launched two decades ago.

Development of a screening programme led to the need to build capacity for lifestyle interventions and the subsequent broader involvement of public health and health care professionals.

Public health interventions addressing challenges, such as those related to primary and secondary prevention, have to be closely linked to the work in the local communities. This is best achieved in developing programmes jointly with primary care, municipalities, educational and social sector as well as NGOs. The original approach of developing secondary prevention interventions needs a further amplification in broadening the base for interventions from a single problem to an array of issues.

Previous approach with the development of Health Education Centres (HECs) was to be upgraded through the development of Health Promotion Centres (HPCs). This required the move from a more traditional approach to addressing individual determinants arising primarily in individuals to a comprehensive approach addressing health and health determinants in all ages. The focus of intervention becomes the local community and the central location is the primary health centre with the specific focus to health equity.

Development of primary and secondary prevention interventions is a measure to address health in the local community. Their placement in primary care ensures equality in access to all citizens in all age groups. Flexibility in approach enables us to develop interventions for the different facets of health.

The public health system in France and the structural developments during the last ten years

Pierre Arwidson

P Arwidson[1]
[1]Public Health France, Paris, France
Contact: Pierre.ARWIDSON@santepubliquefrance.fr

In 2009, the hospitals, health and territories act has entrusted the responsibility for care and public health to the regional health agencies. This decentralisation aims to adapt strategies to local situations. These regional agencies have a very strong autonomy.

In 2013, it was stated in the national health strategy that it was necessary to develop a scientifically based prevention. Two tracks are to be followed: either by importing and adapting validated or promising programs by identifying effective programs in the international literature; or from existing French initiatives (tobacco, alcohol, psychoactive substances, physical activity).

The high prevalence of smoking motivated the establishment of a National tobacco reduction program in 2014, which was then relayed by a national tobacco control program.

In 2016, the Health System Improvement Act created a major national public health agency combining surveillance, prevention, health promotion and emergency response. The motivation was to achieve greater synergy and collaboration between the different functions in public health. A report from the Inspectorate General of Social Affairs has recommended that this agency should establish a national portal with evidence-based prevention and health promotion programmes.

Established in 2018, the Priority Prevention Plan is a major interdepartmental project to improve the health of the population, and is part of the National Health Strategy. This interdepartmental approach reflects the Government's desire that all ministries should be able to contribute to prevention and health promotion.

The increased investment in prevention and health promotion is starting to bear fruit with 1.6 million fewer smokers between 2016 and 2018. Immunisation coverage has also been improved. NutriScore, a nutritional information on the front of food containers, very easy to understand, has been put in place with partnership with 100 companies.

9.I. Skills building seminar: Skillscamp: from soft skills to health for all

Organised by: EUPHAnxt, EuronetMRPH, Young Forum Gastein
Chair persons: Alexei Croitoru - Austria, Gisela Leiras - Portugal
Contact: keitly.mensah@gmail.com

Soft skill-intensive occupations will account for two-thirds of all jobs by 2030. [1] Soft skills, also known as ‘‘people skills’’ or ‘‘interpersonal skills’’ are personal attributes that enhance an individual's interactions, career prospects and job performance. Those skills are of crucial importance for problem solving, teamwork, leadership development, mentoring, etc. They are also actively applied and broadly fostered in both public and private sectors as well as NGOs, social entrepreneurship, media, etc. These actors play an essential role in achieving Universal Health Coverage (UHC) along with health inclusion and equity due to their contribution to public economy, involvement toward specific population and advocacy power.

Key public health (PH) interventions require health professionals with strong soft skills. For example, a vaccination programme can be strengthened by health professionals who are able to address patients' concerns about vaccination and explain its benefits. Having PH teams with a wide variety of perspectives, multidisciplinary backgrounds and skills, adds significantly to the improvement of provided services and medical results.

The demand of soft skills requires contextually appropriate PH interventions, depending on the population's needs, socio-economic and societal structures. Hence, in order to solve the persisting problems and achieve actionable results, the intervention shall be tailored to fit the concrete target group. In order to reach Goal 3 of the Sustainable Development Goals (SDGs) and particularly ‘‘health for all’’, soft skills are essential to empathise and interact with social groups with specific needs.

The workshop will address the challenges faced by medical professionals in the interaction process with three specific social groups. To optimise PH interventions in the most inclusive and equitable manner, adequate soft skills are required. Therefore, the focus will be on highlighting the skills which are essential to successfully perform PH interventions.

Within the scope of the session, the necessary soft skills will be defined and analysed. Also, their application in the context of PH will be demonstrated and exemplified. The attendants will be invited to discuss real-life examples and have the possibility to exchange their own experience and expertise with each other.

[1] Deloitte Access Economics ‘‘Soft skills for business success’’, DeakinCo, May 2017

Key messages:

- Soft skills are increasingly needed in achieving successful public health interventions.
- PH professionals need more awareness of the powers of soft skills.

Introduction to soft skills

Kasia Czabanowska

K Czabanowska[1]
[1]Department of International Health, Maastricht University, Maastricht, Netherlands
Contact: kasia.czabanowska@maastrichtuniversity.nl

She will introduce soft skills, their use and development through a PH career. She will outline soft skills related to medical background and those related to non medical background and how people using them should work together. The last part will introduce soft skills use for vulnerable population providing examples of their importance in specific situations. (30')

Soft skills for esearch on gender and sexual minorities

Arjan van der Star

A van der Star[1]
[1]Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
Contact: arjan.van.der.star@ki.se

LGBTQI+ individuals and the healthcare system. Arjan will present a variety of issues that LGBTQI+ individuals may face when trying to access healthcare or during interactions with healthcare professionals. The group will discuss how and which soft skills would tie into these issues and will brainstorm about ideas for strategies tackling LGBTQI+ discrimination in healthcare systems across Europe. (20')

Challenges and opportunities for health professional providing care for refugees and migrants

Antonio Chiarenza

A Chiarenza[1]
[1]Research & Innovation, Clinical Governance, AUSL of Reggio Emilia, Reggio Emilia, Italy
Contact: Antonio.Chiarenza@ausl.re.it

Health professionals face specific challenges providing care for migrants and refugees, including communication barriers, misunderstanding due to cultural differences, patient's low health literacy. Rather than relying exclusively on a preconceived knowledge about migrant cultures, health professionals should invest more in the relationship with the patient listening and giving prominence to the patient's story. This part of the WS will explore the soft-skills needed to establish a trustful and effective care relation with migrant and refugee patients. (20')

Soft skills to improve the health of homeless people

Freek Spinnewijn

F Spinnewijn[1]
[1]Feantsa, Brussels, Belgium
Contact: freek.spinnewijn@feantsa.org

Issues that homeless people may face during access to healthcare will be presented. The group will discuss skills needed to overcome those gaps, how they can be developed and ideas to use then in an effective way when interacting with homeless population. (20')

Interactive activity and discussion

A representative of each group will be invited to share the outcomes and main points with the audience.

9.K. Workshop: To regulate or not to regulate: that is still the question

Organised by: EUPHA
Chair persons: Natasha Azzopardi Muscat - EUPHA, Dineke Zeegers Paget - EUPHA
Contact: d.zeegers@euphaoffice.org

Public health has always had a close relation with regulation. In the middle ages, the spread of infectious diseases was regulated by imposing a quarantine on travellers, this measure is still the first step to containment of an infectious disease. In the last century, public health regulation was also aimed at smoking, for instance implementing laws to ban smoking in public places (e.g restaurants). These regulations are very often combined with public health information campaigns on how to quit, the negative effects of smoking and passive smoking. In recent years, public health still calls for regulations now aiming at food, such as the fat tax, soda tax and sugar tax.

Regulating for public health is a complex and sensitive issue. Sometimes it is used to solve public health's failings at promoting a healthy lifestyle. For instance, the information campaigns to overcome obesity and invite people to eat healthily and exercise were not as successful as planned and the obesity epidemic remains an increasing problem. So, law kicked in and taxation policies to change dietary behaviours were introduced. Taxation policies, however, are controversial and widely discussed. The term 'Nanny-State' where the government is regarded as overprotective or as interfering unduly with personal choice, comes to mind and this has a negative impact on public health.

The question remains: should we regulate for healthier behaviour or not. In this workshop, we are going to try answer this question. After two general presentations, we have 3 country examples of the relation between law/regulations and public health, followed by a discussion with the audience.

Key messages:

- Regulation can be one of the tools to promote public health.
- Careful consideration should be given before regulating for public health.

Building bridges between public health and law

Farhang Tahzib

F Tahzib[1]
[1]Faculty of Public Health, London, UK
Contact: farhang.tahzib@gmail.com

The nanny state has become a metaphor in debates about public health regulation, cautioning governments against taking action. The nanny state metaphor is being used to criticize health policies for restricting choice and autonomy and warn against undue paternalism. Nanny state accusations can function as powerful rhetorical weapons against interventions that are intended to benefit people.

An emerging trend to tax sugar sweetened beverages and other junk foods: overregulation or an effective way to modify dietary behaviours?

Piotr Romaniuk

P Romaniuk[1]
[1]Deparment of Health Policy, Medical University of Silesia, Bytom, Poland
Contact: promaniuk@sum.edu.pl

Dietary behaviours have an important impact on rising prevalence of noncommunicable diseases responsible for 71% of deaths globally/year. Dietary behaviours also have a growing impact on quality of life, disabilities, as well as economic stability of health systems. In order to overcome the growing impact, many countries are looking for instruments to modify dietary habits of individuals. In the study presented here, we looked at solutions implemented in different countries in terms of junk food taxation, with regard to the political processes related to their implementation, adopted models of taxation, as well as their impact on social and economic reality. Throughout the world, several countries have adopted dietary taxes, such as sugar, fat, salt and soda taxes, while the other are planning or considering doing so. So far there is only one example of withdrawal from the tax that has been implemented. There are different models of taxation, including flat rates, percentages of the basic price and progressive rates on the amount of the component being subject to taxation. These solutions continue to be controversial and subject to intensive discussions in many countries. Nonetheless, the existing evidence shows that the impact on dietary habits seems to be positive.

Example 1: Danish regulations to phase out smoking

Charlotta Pisinger

C Pisinger[1]
[1]Center for Clinical Research and Prevention, Frederiksberg Hospital, Frederiksberg, Denmark
Contact: charlotta.pisinger@regionh.dk

In recent years, progress in Danish tobacco control has come to a halt and there has been an increase in smoking prevalence.

A capacity assessment report on the implementation of effective tobacco control measures concluded that there is no overall strategy or plan to protect children, adolescents and adults from the harms of tobacco, despite the national vision of no children and adolescents smoking by 2030. Another finding was that the tobacco industry is influential in Danish policy-making and not properly regulated. Key recommendations were: 1) Develop an overall, comprehensive strategy and implement a well-designed plan. 2) Increase tobacco taxes. 3) Adopt plain packaging and a point-of-sale display ban. 4) Ensure protection from exposure to second-hand smoke and 5) Protect public health policy from the influence of the tobacco industry. The Danish Government, however, is very reluctant and there is no sign of implementation of the recommendations, despite strong public support. On the other hand, there is progress at local level as many municipalities and private workplaces have implemented smokefree working hours (no smoking at all during working hours, even if you work at home), schools have implemented smokefree school hours (no smoking from 8 to 16, even if pupils go home for lunch or break) and large supermarket chains have implemented point-of-sale display bans.

Example 2: The Italian law on compulsory vaccinations

Carlo Signorelli

C Signorelli[1]
[1]Italian Society of Hygiene, Preventive Medicine and Public Health, Rome, Italy
Contact: signorellicarlo2307@gmail.com

In March 2017, the so-called ‘‘Lorenzin law’’ (named after former health minister Beatrice Lorenzin who was responsible for the bill) was introduced to implement compulsory vaccination for children six years old and younger to be allowed into the school system. Without proof of the required immunizations, including those for measles, mumps, rubella, chickenpox and polio, children were not eligible to attend kindergarten. But the Five Star Movement and the League, which formed a ruling coalition in 2018 to form the current government, pledged to scrap the vaccination obligation during the run-up to elections in March, courting the so-called ‘‘anti-vax’’ vote. The newly appointed minister of health, Giulia Grillo, adopted a temporary measure relaxing these vaccination requirements until the end of March 2019. The temporary measure allowed children to stay in school as long as their parents attested that the children had been vaccinated. A doctor’s note was not needed.

The temporary measure was adopted pending a complete revision of the law on compulsory vaccinations. As no new law was adopted in March 2019, the previous law returned to force, leading for instance to around 300 children in Bologna, Italy, not being admitted to kindergarten as they did not have the required immunizations. Amid confusion over the rules as the new school year begins, the governing Five Star Movement (M5S) presented parliament with an amendment that effectively halts its own reform and reinstates the previous vaccination requirements.

Example 3: The Dutch ‘polder model’

Thomas Plochg

T Plochg[1]
[1]Federatie voor Gezondheid, Utrecht, Netherlands
Contact: t.plochg@federatievoorgezondheid.nl

The Dutch are known for their ‘polder model’, a form of consensus decision-making and cooperation despite differences. In line with this longstanding tradition, the Federation for Health has transformed itself from a national public health association into a national public-private network that strengthens the foundation for health actions at the widest scale possible. More than 70 organisations have joined the network. Amongst them organisations like public health institutions, professional societies, healthcare insurers, private companies, and health start-ups. Instead of calling for regulation or legislation, the Federation for Health promotes the incorporating of the ‘right’ incentives in healthcare and society at large. Examples are the advocating for a national prevention agreement, the development of a new business model based on health (instead of disease), and the advocating for a national digital health agenda. The Federation for Health is using the following tools:

- Sharing of information
- Develop common ground
- Develop an all-inclusive advocacy strategy
- Broaden the vision to non-health-related areas (e.g. social domain, housing, education, businesses)
- Collaborate outside the field of health (building bridges)

9.L. Round table: Health in Environmental Impact Assessment: getting serious about primary prevention

Organised by: WHO RHN, WHO ECEH, Regional Government of Andalusia, EUPHA, (HIA)Chair persons: Francesco Zambon - WHO EURO, Piedad Martin-Olmedo - Spain
Contact: zambonf@who.int

There is an increasing awareness in Europe that health is determined largely by factors outside the health sector. Thus, as public policies in all sectors and at different levels of governance may have a significant impact on population health, a new approach for tackling health is needed. Health in All Policies is an approach to public policies across sectors that systematically considers the health implications of decisions, seeks synergies, and optimises them to improve population health and health equity. Therefore, engagement of the health sector in other policies should be a priority within public health. However, it is bound to meet some resistances as it entails new roles in public health practice, bringing some practitioners out of their comfort zone.

Implementing the health in all policies agenda on the ground is challenging, and tools such as Health Impact Assessment (HIA) are needed to enable policy-makers to predict and govern the consequences of their proposals on the well-being of the affected population, and to optimise them. Advocacy and support from the public health sector are imperative to achieve these goals. This also means placing public health professionals outside their usual area of expertise, confronted with alien sectors such as urban planning or infrastructure development.

HIA expertise and capacity are still scarce and unevenly distributed in Europe. Indeed, lack of awareness, capacities and resistance from public health officials are usually cited as some of the barriers preventing its establishment as a field of work in many countries. To deal with this problem, many countries and subnational entities have been developing resources such as databases and websites, while others have embarked on capacity building. As a result, there has been a widespread use of HIA in Europe in recent years and sharing some successful case studies is important.

The WHO Europe Regions for Health Network (RHN) aims at documenting and disseminating best practices to improve populations' health across Europe. Andalusia (Spain), through its Regional Ministry of Health, has been implementing HIA over the last five years, focusing on the development of tools and procedures, identifying elements of success, conflicts and reluctances, and windows of opportunity.

This workshop is intended to share the existing experiences on HIA and to launch a new RHN case-study publication collecting best practices on HIA across Europe.

After an introduction by the chairperson, a presentation by WHO will provide an overview of HIA in Europe, followed by a representative from Andalusia who will focus on the challenges and opportunities found in implementing HIA as a stand-alone document partially integrated with Environmental Impact Assessment procedures. The presentations will be followed by a panel discussion with panelists representing the subnational level of governance, from 5 different countries in Europe: Belgium, Germany, Russian Federation, Spain, Switzerland.

Key messages:

- HIA is a tool for implementation of the health in all policy agenda; a resource for addressing complex environmental health determinants and a way of being faithful to WHO's definition of health.
- HIA can be simple, if needed. In HIA, too, the best is the enemy of the good. It ''operates deliberately in imperfection'' as in many cases where stakes are high, decisions urgent and evidence uncertain.

Health impact assessment: what it takes, what it can and cannot deliver

Julia Nowacki

M Martuzzi[1], *J Nowacki*[1]

[1]WHO European Centre for Environment and Health, WHO, Bonn, Germany

Contact: martuzzim@who.int

WHO, along with other health agencies, has been long promoting intersectoral action between health and all sectors of society, so as to address major, ''upstream'' determinants of health. Sectors as environment, transport, energy, agriculture etc, influence countless, powerful such determinants, mostly out of reach for the health sector; health-friendly (or at least health-minded) decisions on those determinants can result in a strong leverage for health advocates to achieve primary prevention.

This undertaking requires: the establishment of a common language to be used with other sectors; the recognition of the complex web of causation between health determinants and health outcomes; commitment to working with a broad model of health combined with a preparedness to prioritise where necessary; a sound comprehension of the reality of decision making in different political environments; realistic expectations on what can and cannot be achieved through cross-sectoral dialogue; willingness to listen to stakeholders; constant attention towards health equity.

Health Impact Assessment (HIA) is an established approach towards these goals. HIA describes a broad range of methods and tools, building on different disciplines and expertise. HIA aims at estimating and predicting consequences and impacts of proposed policies and plans, with the ultimate goal of influencing decisions, making them more health friendly, equitable, legitimate and sustainable.

The practice of HIA has been evolving in the last 20 years. Many years of application have been instrumental in identifying strengths and weaknesses, opportunities and threats in different settings. HIA has delivered handsomely in some countries or regions, while it struggles to become established in others. A continued critical evaluation of successes and failures remain important to make further progress in this domain. In this presentation, WHO will present recent progress and open questions on the practice of HIA in Europe.

Systematically introducing the 'health factor' in decision-making is possible: The success case of Andalusia

Francisco Javier Rodríguez Rasero

F Rodríguez Rasero[1], *LA Moya Ruano*[1], *E Madrid Verdugo*[1], *J Vela Ríos*[1]

[1]Health Department, Regional Government of Andalusia, Seville, Spain

Contact: francisco.rodriguez.rasero@juntadeandalucia.es

Health Impact Assessment (HIA) as a stand-alone report integrated in environmental assessments has been compulsory for the last 5 years in Andalusia. In this time, it has been proven as a successful tool for implementing the Health in All Policies strategy, delivering consistently better outcomes for the examined projects.

We will describe the tools and methods used to achieve these results through the presentation of three examples. In so doing, it will be shown how HIA allows us to consider issues often neglected in decision-making processes and how it provides with an added value over other assessments already being carried out.

The first example deals with a food industry. HIA focused on the depiction of affected population, singling out vulnerable traits using geographic information systems and open social and demographic data. Combined with a study of air dispersion of pollutants, it enabled us to find inequities in the distribution of impacts, propitiating thus the inclusion of additional measures of emissions abatement.

HIA also helps raising awareness in other sectors. The second case shows a big change of attitude experienced in the urban planning department of a big city. After some initial reserves, the municipality based the decision about the relocation of a social centre on the assessment of expected positive impacts on social determinants of health. Bringing together these outcomes and the results of public consultation, a new optimal location was chosen.

Finally, HIA also allows for greater transparency and accountability in public policies. The report for the Andalusian Air Quality Strategy not only provided health outcomes (morbidity and mortality) but also turned them into monetary values, as experience has shown that policy-makers find it difficult to understand standard health measures. This approach makes possible to contribute to cost-benefit analysis and keeps in line with EC guidelines on Public Policies Assessment.

9.M. Workshop: Creating healthy living environments in municipalities – European concepts, needs and actions

Organised by: Federal Centre for Health Education, Germany
Chair persons: Christina Plantz - Germany, Eike Quilling - Germany
Contact: christina.plantz@bzga.de

Health equity is influenced by the local social and physical environment we are living in. Municipalities all over Europe have a key role in shaping and addressing these living conditions. This is why one of the Work packages in the current EU Joint Action Health Equity Europe (JAHEE) deals with the living environment, and what municipalities can contribute to shape them in a health promoting and equity-oriented way. Current action in this field is fragmented, varies highly between and within European countries and strongly depends on political leadership. The Work package aims at providing a systematic and structured support for participating countries in taking action to create healthy living environments. In Work package 6 - Healthy living environments, 17 national and regional public health authorities from 13 countries collaborate to exchange knowledge, practices and implement actions that promote healthy living environments.

This workshop aims at bringing together current knowledge and experience of why and how to create healthy living environments on the municipal level. Furthermore, it is supposed to inform what countries currently do and need to do in this field of action from the perspective of national public health institutes and ministries of health. And thirdly, an innovative local example of how to put the theory into practice will be presented.

The ''Should be'': The first presentation will describe the common conceptual basis for the project partners - the Policy Framework for Action. As was agreed upon among the project partners, the specific focus is a broad community approach towards health promotion that is steered from the municipal level.

The ''To be'': The second presentation will focus on common European challenges and potentials based on the country assessments that were conducted in the frame of the project, and how municipalities can be supported from the European, national and regional levels. Third and fourth presentations will present more in-depth country reports from Greece and Serbia describing the current capacities and potential for municipal health promotion.

The ''Good Practice'': The fifth presentation from the Netherlands will present an innovative approach from the City of Utrecht that is implemented in the frame of the Joint Action Health Equity Europe.

The findings will be discussed using an interactive online-tool, and finally next steps, future actions and recommendations will be outlined.

The workshop will give the possibility for stakeholders that are not currently involved in the Joint Action to inform themselves of the activities on the European level. The broadening of the audience is also crucial for enhancing awareness of health equity and healthy living environments as well as increasing the acceptance of the conceptual framework at national levels. Through exchange of knowledge and experience, potential new partners could be reached and involved in the project.

Key messages:

- The workshop brings together current knowledge of why and how European municipalities can create healthy living environments.
- The workshop presents what European countries currently do and need to do in this field of action.

A common European framework on how to create healthy living environments on the local level

Eike Quilling

E Quilling[1], *C Plantz*[2]
[1]Department for Applied Health Sciences, University of Applied Sciences, Bochum, Germany
[2]International Relations, Federal Centre for Health Education, Cologne, Germany
Contact: Eike.Quilling@hs-gesundheit.de

In a consensus-process, 17 national and regional Public Health authorities from 13 European countries agreed upon a common Policy Framework of Action (PFA) that summarizes the current evidence making the case for healthy living environments and the role of municipalities. The PFA provides a conceptual model for interventions including an ideal process, quality criteria and guiding principles that municipal approaches should be based on.

The PFA is a consensus document based on the results and decisions of the first meeting of the JAHEE-work package partners. It was then circulated among the Work package partners and the JAHEE Steering Committee in two feedback rounds. The PFA development was supported by an interdisciplinary German expert group in the field of public health. To draw up a catalogue of criteria to identify promising practice projects, a number of existing quality assurance instruments for health promotion and prevention focusing on reducing health inequalities were examined and central aspects of the various instruments were identified. The suggested catalogue of criteria is based on good practice as defined by European experience (EQUIHP, JANPA, CHRODIS, INHERIT and the good practice criteria of the German network Equity in Health). These instruments were systematically compared and the criteria found in most instruments were included in the criteria catalogue for the PFA.

Result: 16 good-practice-criteria could be identified - such as ''target group orientation'', ''concept driven strategy'', ''empowerment'', ''networking'' etc. These criteria form an essential basis for the further partner process in the Joint Action. Furthermore, the PFA provides a conceptual model for interventions including an ideal process based on the public health action cycle and guiding principles that municipal approaches should include.

Current capacities and challenges for equity-oriented municipal health promotion in Europe

Christina Plantz

C Plantz[1], *E Quilling*[2]
[1]International Relations, Federal Centre for Health Education, Cologne, Germany
[2]Department for Applied Health Sciences, University of Applied Sciences, Bochum, Germany
Contact: ch.plantz@web.de

As a basis for implementing actions in the frame of Work package 6 - healthy living environments in the Joint Action Health Equity Europe, each of the 13 participating countries conducted a country assessment.

Methods:

The country assessments were self-assessments conducted in the first quarter of 2019. Partners received templates that had been agreed upon beforehand. Most of them conducted the country assessments by themselves or with the help of colleagues from their institutions as a desk-based review, and validated results with external experts and stakeholders. The first part of the country assessment referred to how municipal health promotion capacities are currently developed in the countries. Through the second part of the country assessment, each of the 13 countries selected up to 4 promising practices.

Results:

In most of the 13 countries, municipalities have a clear mandate to promote health. However, there is a big heterogeneity in resources, structures and capacities of municipal health promotion within and between countries. One key challenge is the self-government of municipalities and health promotion as a voluntary task. One of the main problems is a deficit in intersectoral working. It appears that poor municipalities are even more disadvantaged in terms of capacities for municipal health promotion. 33 promising practices were identified, covering programmes, strategies, tools and interventions mostly from the local level, with a big variety of topics and approaches for health equity.

Conclusions:

There is a big fragmentation and heterogeneity in municipal health promotion between and within European countries. National and regional public health authorities are in the position to contribute a lot to support municipalities. This can include promoting quality development, providing data, integrating health equity in existing structures, plans and approaches or collaborating with the broad range of existing stakeholders and networks.

Country Report: How do Greek municipalities currently promote health and health equity?

Joanna Velissari

J Velissari[1], *A Vantarakis*[1,2], *M Zamparas*[2]
[1]Department of Public Health, University of Patras, Patras, Greece
[2]DYPEDE, 6th Health Region of Peloponnese, Ionian Islands Epirus & Western Greece, Patras, Greece
Contact: joannavelis@gmail.com

The establishment of municipalities in Greece is governed by Kallikratis Law (2011). There are 325 municipalities in Greece. The municipalities promote activities relating arts, education, health, sport and social services. In addition, there are a few national laws giving municipalities extra possibilities. Main financial sources of municipalities are municipal taxes, fees and duties, VAT tax. Central government finances major infrastructure projects in the municipalities, based on individual projects. Also, some NGOs are helping municipalities in their social role.

Aim:

The investigation of the promotion of health and health equity in municipal level.

Findings: Social determinants of health are the main causes for health inequalities at a municipal level. Due to that, some municipalities have developed programs to mitigate them. Municipalities have developed the National Intermunicipal Network of Healthy Cities - Health Promotion has as its sole purpose the prevention of diseases, health Promotion, the screening control of high-risk population groups and generally promote integrated policies in the field of Public Health. Today includes 218 (67%) KALLIKRATI Municipalities from all regions of the country.

Municipal social capacities are: kindergartens, programs for migrants, daily care centres for elder people, health care centres (urban and rural), community nursing /home nursing care, mainly to elder and vulnerable groups.

Environmental hygiene: The most important role is the collection of household waste and their appropriate disposal, as well as the protection of the environment.

There are difficulties in promoting health and health equity by the municipalities: a) lack of financial & human recourses, b) lack of explicit responsibility of Municipalities c) lack of capacity about health issues and 4) bureaucracy.

Conclusions:

There is place for action at the municipal allowing municipalities to implement various programs relating to healthy living environments.

Country Report: How do Serbian municipalities currently promote health and health equity?

Milena Vasic

V Karadzic[1], *D Jovanovic*[1], *M Vasic*[1]
[1]IPHS, National Institute of Public Health, Belgrade, Serbia
Contact: milena_vasic@batut.org.rs

A legal framework set in Serbia provide good basis for creating healthy living environment and health promotion at local level. The present system of local government in Serbia, with its 174 units is regulated by the Law on Local Self Government. In accordance to this Law each municipality has got a certain level of decision-making. Creating healthy living environment is one of the key objectives of municipal policy and its agenda. However, the extent of their inclusion and implementation is very heterogeneous between municipalities. Unequal municipalities' capacities (financial, technical, human resources) for coordination and development of healthy living environment on the municipality level are crucial challenge. In order to support the activities at the local level, the Network of 24 regional institutes of public health, led by the Institute of Public Health of Serbia, develops public health guidance, participate in drafting local strategies, programs and activities. Additional support is provided by the Local Health Councils, increasing a political sensibility for prioritizing issues to achieve healthy living environment. The coherent framework of mandates, local strategies and action plans for improving the public health have been established through widespread cooperation between the institutes of public health, health councils, and other stakeholders (e.g. nongovernmental organizations and governmental bodies such as the ministries responsible for education, environmental protection, youth and sport). In spite of that, their implementation is restricted by low awareness of importance of health equity and health promotion. In that sense, training and education on health promotion and health equity issues are crucial to raise the awareness, increase health literacy and enable satisfactory and quality implementation of defined strategies, programs and activities at the municipality level.

How the City of Utrecht develops a Health and Equity in all Policies approach

Miriam Weber

M Weber[1]
[1]Public Health, City of Utrecht, Utrecht, Netherlands
Contact: m.weber@utrecht.nl

Public health policy, spatial and environmental policies are within the Dutch municipalities' competencies. In 2021 a new act will be implemented, in which todays' more sectoral acts and decrees will be integrated into the so-called (Healthy) Living environment act. This will require more integrated, inter-sectoral and multi-level governance approaches. And new topics and societal challenges, such as health, sustainability and resilience, are introduced within the physical planning domains.

Dutch reviews learn that public health and social domains are collaborating quite well at the local level. The cooperation and integration of health, environmental and spatial planning, on the other hand, often is less or even absent. In Utrecht, though, the latter inter-sectoral approach is strong; health in all policies has been the 'mantra' since several years. Supported and institutionalized through strong political leadership, and interdisciplinary teams at neighbourhood and city level, for policy development and implementation in line with the city's ambitions of Healthy Urban Living for Everybody.

Utrecht is the healthiest and fastest growing city in the Netherlands, and aims to use its growth (in population, jobs, houses, etc.) to address health inequalities. The city is linking spatial challenges with social challenges, building and improving houses and residential areas for all citizens. A new initiative, called social renovations, will be explored and reviewed within the JAHEE process. This initiative addresses many of the relevant topics, such as healthy living environment planning, stakeholder involvement and specifically reaching 'hard to reach groups', and improving housing and public space conditions and subsequently health and well-being of vulnerable groups.

9.N. Round table: Strengthening capacities in health information for better public health practice in Member States

Organised by: InfAct, Sciensano, EUPHA (PHMR)
Chair persons: Claudia Habl - Austria, Herman Van Oyen - Belgium
Contact: petronille.bogaert@sciensano.be

According to Sir Michael Marmot: ''To address inequalities in health in Europe, our first step must be to address the inequalities in health information (HI). All too commonly where health is poorest, HI tends to be poorest. HI is absent or incomplete just where we need it most.'' One of the specific objectives of the Joint Action on Health Information (InfAct) is to reduce HI inequalities between and within EU Member States (MS). InfAct is addressing this through various capacity strengthening exercises including the design of a sustainable EU HI training programme. In this workshop, a first presentation will describe the development of the HI training programme for professionals working in HI within MS institutions. Subsequently, four capacity strengthening exercise will be presented illustrating potential topics to be covered in such a sustainable HI training programme. These 5 short presentations will feed the discussion of the workshop organised as a round table.

The first exercise is an assessment of HI systems carried out by InfAct through peer review in 9 countries using an adjusted WHO Europe tool. The exercise builds on the framework of mutual learning and good practice exchange to identify in a standardised way strengths and limitations, and recommendations for direct and long-term improvement of their HI system.

The second exercise presents 2 workshops given by InfAct on the European and National Burden of Disease (BoD) methodologies. The effort contributed to harmonising BoD methodologies at national and EU levels, thereby increasing comparability and facilitating knowledge exchange on BoD bilaterally and multilaterally in the EU.

The third exercise presents an example of capacity building activities organised in the framework of a national prevention programme on cardiovascular risk assessment, which includes training of health professionals, provision of training material and risk evaluation tools, implementation in clinical practice, health data collection, and feedback of results in the community.

The fourth exercise presents examples of capacity building activities by the European Health Examination Survey (EHES) initiative to establish a sustainable European network on nationally representative Health Examination Surveys (HESs), through hands-on training events, online training materials, person-to-person consultations, site visits and networking.

This workshop provides participants insights on current activities in HI capacity strengthening in Europe which address health (information) inequalities. Additionally, participants will be able to provide feedback on the development of the sustainable HI training programme and potential elements that could be included based on four practical examples. The participants will be able to highlight their needs in health information training by interacting through a round table panel discussion.

Key messages:

- Health information capacity strengthening is essential to address health inequalities. The workshop identifies what a sustainable EU HI training program can provide.
- Mutual learning, knowledge and good practice exchange can be organised in various ways – we show practical current examples on how it has been done.

Developing a health information (HI) training programme: strengthening the public health workforce

Luís Velez-Lapão

L Velez-Lapão[1], A Beja[1], P Nogueira[2,3]
[1]Institute of Hygiene and Tropical Medicine, Universidade NOVA de Lisboa, Lisbon, Portugal
[2]Faculty of Medicine, University of Lisbon, Lisbon, Portugal
[3]Division Epidemiology and Statistics, Directorate-General of Health, Lisbon, Portugal
Contact: luisvlapao@gmail.com

Background:

New developments and technologies require skilled professionals to manage and use public health information in most efficient ways. However, currently training in specific fields is lacking and large inequalities exist in Europe in terms of the availability and training of qualified professionals.

Methods:

In order to set up a sustainable EU HI training program for HI professionals, core modules need to be selected to provide adequate training across Europe. This study a scoping review and is doing a survey on current existing HI programmes and aimes to identify the main educational components needed to train HI professionals. The databases of Pubmed and Ebsco were searched for the scoping review. The survey is being circulated to representatives of InfAct in 28 countries. Based on the results a baseline HI training programme for practicing public health professionals will be proposed.

Results:

Initial search identified 249 papers. After the exclusion of duplicates and unavailable documents, 53 papers were selected for review. Only 5 papers were found related to the European context. However the results from other papers could be extrapolated. The results were organised in 3 domains: organisation, people and technology dimensions. The development of HI capacities is often done through multiple and sequential interventions, which are adapted to the needs, conditions and resources available within each HIS. Thus, the importance of aligning training with working processes and usability in professional practice is key. This can be challenging, as HI functions are diverse across Europe. The results of the survey will be presented when processed by the time of the workshop.

Conclusions:

There is a need for qualified skilled professionals in HI taking into account a changing global environment. Most of HI capacity building programmes are yet to reach maturity, and this review and survey identify a set of important areas for further development of the HI training programme.

Strengthening health information systems in Europe through peer review assessments

Petronille Bogaert

P Bogaert[1,2], LA Abboud[1], N Calleja[3], T Ziese[4], A Fehr[4], H Van Oyen[1,5]
[1]Department of Epidemiology and Public health, Sciensano, Brussels, Belgium

[2]School of Social and Behavioral Sciences, Tilburg University, Tilburg, Netherlands
[3]Directorate for Health Information & Research, Ministry of Health, Gwardamangia, Malta
[4]Department of Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
[5]Department of Public Health, Ghent University, Ghent, Belgium
Contact: petronille.bogaert@sciensano.be

Background:

How does your Health Information System (HIS) measure up to others in the EU? How can you empower national HIS players with an objective peer-reviewed HIS assessment? Nine InfAct partners engaged in a capacity building exercise where experts in rotating groups of three countries performed peer assessments of each other's national HIS. Using a WHO Europe adapted and refined tool, assessors analysed the HIS of a country (data collection, processing, analysis, dissemination and use) and exchanged practices in an intensive 2-day schedule of interviews with established key stakeholders.

Objectives:

The aim of the peer assessment is three-fold: to test the feasibility of a peer-review HIS assessment, to map heath information inequalities across EU MSs, and to strengthen the knowledge of HIS players.

Results:

Two cycles are now complete and the feedback is overwhelmingly positive - from assessors and hosts alike. So far, the HIS assessment has been a major success in its ability to systematically and concisely analyse a HIS. It identifies gaps in the HIS through desk review and interviews, and provides a SWOT analysis and SMART recommendations to address these gaps. Additionally, this exercise has shown the ability to increase stakeholders' awareness of their role in their national HIS, and to build new networks within and between MSs. The exercise is also perceived as an opportunity for cross-fertilisation of ideas and exploration of methodologies on how to address specific challenges. This will stimulate actions to improve national HISs, and will lead to the identification of good practices which can then be used by other EU countries.

Conclusions:

By bringing together key HIS stakeholders from different countries and stimulating the improvement of HIS and the exchange of good practices, InfAct contributes to capacity building in the EU, which in turn may lead to the reduction of health information inequalities between countries.

Development of composite indicators to monitor burden of disease across Member States

Romana Haneef

R Haneef[1], A Gallay[1], H Hilderink[2], B Devleesschauwer[3,4], T Ziese[5], J Schmidt[6], J Newton[6]
[1]Departement of Non-Communicable Diseases and Injuries, Santé Publique France, Saint-Maurice, France
[2]Centre for Public Health Forecasting, RIVM, Bilthoven, Netherlands
[3]Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium
[4]Department of Veterinary Public Health and Food Safety, Ghent University, Merelbeke, Belgium
[5]Department of Epidemiology and Health Monitoring, Robert Koch-Institute, Berlin, Germany
[6]Health Improvement, Public Health England, London, UK
Contact: Romana.HANEEF@santepubliquefrance.fr

Background:

The burden of disease (BoD) methods are not part of routine public health activities and policy development process across all Member States (MSs). The main reasons for this are varying levels of knowledge, experience, and capability to apply and use BoD methods. Therefore, MSs need support, guidance and training to adopt and integrate BoD approaches in their public health systems. In this context, two workshops have been organised by InfAct. The main objectives of the workshops are to raise awareness, share knowledge and experience, and to provide mutual support to to integrate BoD indicators in the public health policies across Europe.

Methods:

The workshops were about the BoD concept and methodologies, and the use of BoD data in public health policy. These workshops were supported by technical presentations describing methods and the use of BoD data in health policy with various case studies, followed by expert exchange with facilitated discussions and group work. The case studies included national BoD studies from Belgium, Germany, Netherland, and Scotland.

Results:

Two workshops were held at Santé Publique France, and attended by 16 BoD experts and 40 participants from 25 MSs. The workshops were well received by the participants particularly with regards to the diversity of the group and the possibility to share knowledge and experience from various perspectives. Three areas of action were highlighted: 1. the need for methodological trainings to strengthen skills in interpreting and calculating BoD estimates; 2. the encouragement of more collaborations across MSs to share or exchange good practices on BoD; and 3. the importance of the implications of BoD data to guide policies across MSs.

Conclusions:

The workshops highlighted the need for capacity building activities to implement BoD approaches across MSs in routine public health activities and to use BoD data to guide health policy. More collaborations among MSs on BoD activities are needed in the future.

Global cardiovascular risk assessment: a national training course for General Practitioners

Luigi Palmieri

L Palmieri[1], B Unim[1], E Mattei[1], M Tijhuis[2], A Fehr[3], G Corrao[4], I Lavicoli[5], T Grisetti[1], P Bogaert[6,7], D Donfrancesco[1]
[1]Department of Cardiovascular, Endocrine-metabolic Diseases, National Institute of Health, Rome, Italy
[2]Centre for Health Knowledge Integration, RIVM, Bilthoven, Netherlands
[3]Department of Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
[4]Department of Statistics and Quantitative Methods, University of Milano-Bicocca, Milan, Italy
[5]Department of Public Health, University of Naples Federico II, Naples, Italy
[6]Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium
[7]School of Social and Behavioral Sciences, Tilburg University, Tilburg, Netherlands
Contact: luigi.palmieri@iss.it

Background:

Identification of high risk individuals is one of the main goals of the primary prevention of cardiovascular disease (CVD) and constitutes the basis for implementing actions aiming at reducing modifiable risk factors at individual level through changing life styles or drug interventions. The most appropriate method for identifying high risk individuals is the absolute risk assessment, a probability indicator of incidence, predictable on the basis of risk factors levels.

Objectives:

The CUORE project score of the National Institute of Health-ISS is adopted in Italy; since 2007 ISS has implemented a national training course for General Practitioners-GPs with the aim of supporting and facilitating the use of CVD risk assessment in clinical practice as a preventive action in the general population.

Results:

The training course is based on five sequential packages linked to educational credits: packages 1-2 facilitate the adoption of standardised methodologies for the assessment of CVD risk score; in package 3 patients are invited by GPs to assess the risk score; packages 4-5 evaluate and discuss data collected with GPs and stakeholders. A cascade training was implemented: ISS personnel provided training to local GPs who in turn provided the same training to other GPs. Two manuals for the training course were published.

Since 2007 about 4,300 GPs were trained; about 320,000 10-year CVD risk assessments were performed in 260,000 men and women aged 35-69 years. Feedback was provided to all GPs participating to the 4th-5th packages of the training courses.

Conclusions:

Implementation of the training course for the use of CVD risk assessment in the population represents a primary preventive action according to the recommendation of the EU Guideline on CVD prevention. The collected data may play an important role in the identification of strengths and weaknesses of preventive actions and represents the first step to improve good clinical practices standards.

Building a sustainable network of health examination surveys through training and mutual learning

Hanna Tolonen

H Tolonen[1]
[1]Department of Public Health Solutions, National Institute for Health and Welfare, Helsinki, Finland
Contact: hanna.tolonen@thl.fi

Background:

Health information is a broad concept and can be obtained from variety of data sources such as administrative and disease specific registers, surveys, longitudinal studies etc. Health surveys comprise two main formats; questionnaire based health interview surveys (HIS) and more comprehensive health examination surveys (HES) which include also objective health measurements and collection of biological samples. At the European level, HISs are coordinated under European Health Interview Survey (EHIS) by Eurostat. For HESs, the European Health Examination Survey (EHES) initiative has been responsible for the coordination and capacity building.

Objective: The EHES initiative aims to establish a sustainable European network on nationally representative HESs, which use standardised methods and therefore, provide comparable information between and within countries.

Results:

EHES has prepared standardised protocols for objective measurements and several guidelines for organisation of the survey. To enhance use of these protocols and guidelines, several capacity building activities took place during 2010-2019. These activities include hands-on training events, online training materials, person-to-person consultations, site visits and networking.

A survey among national HES organisers was conducted in 2017 to evaluate which of the capacity building activities were perceived as most important. Based on this survey, availability of standardised protocols and guidelines was seen very important as well as hand-on training events and person-to-person consultations.

Conclusions:

National HES data is actively used for health monitoring and identification of public health problems, for development of health and prevention programmes and to support evidence-informed policies. EHES capacity building activities support establishment and development of national HESs across Europe and enhance benchmarking between countries.

9.O. Workshop: Access to Medicines: A theatrical exploration of diverse perspectives

Organised by: University of Liverpool, UK
Chair persons: Lois Orton - UK
Contact: l.c.orton@liverpool.ac.uk

Health inequalities are a highly persistent phenomenon despite having been the focus of global public health action. Low income does not fully explain these differences; women, ethnic minorities and other excluded social groups also fare worse than the rest of the population. Intersectionality is an approach that has gained increasing attention for understanding the complex nature of social inequality and more recently for understanding health inequalities and identifying approaches to address them. An intersectional approach promotes the analysis of multifaceted power structures and processes that produce and sustain unequal health outcomes. It foregrounds how, particularly for the most vulnerable populations, we cannot consider just one axis of inequality, such as poverty, in order to understand differences in health. We must consider the full range of identities and experiences including age, gender, ethnicity, and more. Actions to redress inequalities must take account of how these multifaceted experiences inform one another. But how can we as researchers help with this challenge? There is no single preferred method. A variety of approaches from epidemiology to sociology have been proposed to understand how the intersections of complex aspects of social location, identity and diversity of experience shape health outcomes.

The aim of this workshop is to bring together those who have attempted to take an intersectional approach in their research and those who are interested to learn more about how to do this. Following an introduction to intersectionality theory, three presenters will briefly describe how they have attempted to take an intersectional approach in their research, reflecting on the opportunities and challenges of the approach. The included examples will represent a range of methodologies. In the first presentation, Kristefer Stojanovski will describe how a systematic review of published theories led to the development of a new conceptual model to describe the complex and intersectional pathways to poor health among Roma populations in Europe. Daniel Holman will then describe some multilevel analyses of intersectional inequalities in biomarkers of chronic disease in England. Finally, Lois Orton will describe her critical intersectional analysis of policies purporting to address the ‘‘problem’’ of Roma health and wellbeing. Following the presentations, plenty of time will be allowed for workshop participants to discuss the key considerations for successfully conducting research that takes an intersectional approach. Discussions will be guided by three key questions:

1. What kinds of research questions do we need to be asking in order to address the multiple interacting axes of inequality that shape differences in health?
2. What kinds of study design might help answer these questions?
3. How should we interpret the findings of such studies?

Key messages:

- An intersectionality lens might help to better understand and address health inequalities.
- It is possible to incorporate an intersectional approach into research, in terms of question formulation, study design and interpretation.

Utilizing new theories to understand the complex and intersectional pathways to poor health among Roma populations in Europe

Kristefer Stojanovski

K Stojanovski[1]
[1]Department of Health Behavior & Health Education, University of Michigan, Michigan, USA
Contact: kstojan@umich.edu

Background:

For decades Roma have had the poorest health outcomes among European citizens across the range of health topics including maternal and child health, chronic diseases and infectious diseases. Despite tremendous efforts, such as the Roma Decade and national policies, there have been limited improvements in health to improve parity with non-Roma European citizens.

Aims:

To provide an intersectional understanding of the health of Roma citizens in Europe through the use of complex systems theory.

Methods:

We reviewed peer-reviewed systematic and other major literature reviews, and civil society-based publications that explored the health of Roma. We thematically categorized the identified risk factors, how they influenced health across the multiple levels of the socioecological model (i.e., structural/ policy-, community-, organizational-, interpersonal, and individual-levels) and how the various factors were related to each other. A visualization of the complexity of issues was developed using Stella Architecture.

Results:

The findings indicate that poor health among Roma arises from a complex interplay and intersection of numerous factors across the socioecological model (e.g., structural, community, organization, interpersonal and individual-levels). This visual representation indicates that the poor health of Roma stem from larger structural forces. Moreover, some of the factors at play are related to a multitude of other factors and sometimes act recursively to further structure poor health among Roma.

Conclusions:

The poor health of Roma stems from numerous intersecting factors across multiple levels of the socioecological model. There is a need to improve structural- and community-oriented approaches to address the health needs of Roma through a holistic and multi-sectoral approach.

Intersectional inequalities in biomarkers of chronic disease in England

Daniel Holman

D Holman[1], *A Bell*[1], *S Salway*[2]
[1]School of Health & Related Research, University of Sheffield, Sheffield, UK
[2]Sociological Studies, University of Sheffield, Sheffield, UK
Contact: daniel.holman@sheffield.ac.uk

Background:

Chronic diseases entail huge costs to health services and national economies and significantly affect the quality of life of people who have. Inequalities in chronic diseases are well documented, but less is known about inequalities in (i) biomarkers underlying their incidence (ii) how these inequalities are differentiated according to multiple axes or dis/ advantage which may mutually reinforce or compensate for each other.

Aims:

To map out intersectional inequalities in biomarkers of chronic disease using three national English datasets.

Methods:

The multilevel approach to analysing intersectional inequalities was used, whereby individuals are nested within their intersectional positions/identities. Intersections were defined by combinations of gender, ethnicity, education and income. Age was controlled for. Outcomes were HbA1c, cholesterol, systolic blood pressure, pulse and waist. Findings from understanding Society, the English Longitudinal Study of Ageing and Health Survey for England were compared. Survey data were from 2010-2013.

Findings:

Intersectional inequalities were greatest in waist circumference, followed by cholesterol and HbA1c. They were smallest in systolic blood pressure and pulse. A number of granular intersectional inequalities were observed. Intersectional groups which had the highest values indicating worse health often included more privileged social attributes e.g. medium income and vice-versa. Findings were mostly consistent between datasets, increasing confidence in the results.

Conclusions:

A granular intersectional analysis problematises simplistic notions of inequalities in chronic disease. It is necessary to consider multiple axes of dis/advantage driving such inequalities to both understand them better, and to inform policies and interventions targeted and tailored for specific population subgroups.

The ''problem'' of Roma health and wellbeing: A critical intersectional analysis of European policy perspectives

Lois Orton

L Orton[1], *S Sheard*[1]
[1]Department of Public Health & Policy, University of Liverpool, Liverpool, UK
Contact: l.c.orton@liverpool.ac.uk

Background:

Recent reports suggest large and widening social and health disparities between Roma and non-Roma despite high profile political efforts to redress them. Analysis of this 'policy failure' has so far brought little change in policy approaches.

Aims:

To explore how current representations of the ''problem'' of Roma health and wellbeing have emerged and how they have shaped the actions that have been proposed. We were interested in how the category 'Roma' was constructed and whether this allowed for the multiple identities that might structure inequality.

Methods:

Five oral history interviews were conducted with policy specialists. Policy documents were located through catalogue searches. Analyses explored: 1) the underlying frameworks of thought that shape problem representations; 2) the social categories that are created within these problem representations; and 3) how these categories and representations shaped the solutions that have been proposed.

Findings:

Policies have situated the concern for Roma health within a drive for economic growth. A perception of low productivity is attributed to low educational achievement and subsequently reduced employment opportunities. Inadequate living conditions and low uptake of health care are seen to compound the 'problem' leaving Roma prone to poor health that further limits productivity. The proposed solution is to remove the barriers perceived to prevent Roma from accessing mainstream health, education, employment and housing. Whilst 'gender mainstreaming' is sometimes stated as an aim, there is little evidence of a systematic response to gender equality. Instead, women are seen as part of the solution based on their presumed ability to provide a link to 'close-knit' Roma family structures.

Conclusions:

European policy situates class and ethnicity as key determinants of Roma health. Gender considerations are largely invisible in problem representations although central to proposed solutions.

9.P. Skills building seminar: How to do (and not to do) gender in health research: methods developments and lessons from the field

Organised by: Bielefeld University
Chair persons: Celine Miani - Germany, Melanie Boeckmann - Germany
Contact: celine.miani@uni-bielefeld.de

There is a growing awareness of the role of gender in the production of health inequalities. Gender, as a social construct, is built on culturally constructed roles, behaviours, expectations, opportunities and responsibilities that individuals experience throughout their lives in societies. It is also a reflection of relations to others, and of the power -or disadvantages- that fall upon individuals. The main channels through which gender influences health status, independently and in relation to a person's biological sex or sexual orientation, include differences in exposure to behavioural and environmental risk factors, differences in use of health services and access to treatment, in relationships that form between care providers and patients, and structural determinants such as the design and implementation of public policies and laws.

Despite efforts to adopt a gender-sensitive approach in public health research, gender remains too often an afterthought in the research process, or gender differences an accidental finding. Investigating the complexity of gender-related influences on health status comes with methodological challenges, considering the multiple dimensions of gender and gender identities and their interactions with the social environment. Grasping the realities of gender-related inequalities in health calls for interdisciplinary approaches and multi-level analyses. In this workshop, we present methodological developments and lessons from the field that highlight the role of gender as a social determinant of health, and suggest ways to operationalise it in health research. Drawing from intersectionality theory, which examines how multiple social identities (e.g. sex/gender, race/ethnicity, socioeconomic position, sexuality, age, (dis)ability) intersect at the level of the individual and the structural factors that underpin them, Mena & Bolte develop a conceptual framework for intersectionality-based gender sensitivity in multivariable analysis. Focussing on the intersection between gender and migration, Wandschneider et al. identify best practice for the conceptualisation and operationalisation of gender in migration-related epidemiological research. Batram-Zantvoort et al. aim to demonstrate the value of identifying discrimination and imbalance of power in obstetric care at different levels of analysis, looking at structural, organisational and individual level factors. Jähn et al. critically examine the theoretical foundations and measurement methods of gender roles. Finally, Böckmann et al. reflect back on a smoking cessation intervention in South Asia and on discovering discrepancies between researchers' assumptions and realities of gender roles and behaviours. Between them, presenters will cover several stages of the research process (conceptualisation, measurement, data collection) and cover a range of disciplines, providing a unique opportunity for dialogue and a platform for the development of best practice.

Key messages:

- This workshop will highlight the role of gender as a social determinant of health, and suggest ways to operationalise gender in health research.
- It will also provide a unique opportunity for interdisciplinary dialogue and a platform for the development of gender-sensitive research best practice.

Conceptual framework for intersectionality-based gender sensitivity in multivariable analysis

Emily Mena

E Mena[1,2], *G Bolte*[1,2]
[1]Department of Social Epidemiology, Institute of Public Health and Nursing Research, University of Bremen, Bremen, Germany
[2]Health Sciences Bremen, University of Bremen, Bremen, Germany
Contact: e.mena@uni-bremen.de

Background:

Intersectionality-based gender sensitivity in multivariable analysis might advance simultaneous consideration of intersecting social positions and identities. Identification and implementation of quantitative statistical approaches that adequately operationalise the concept of intersectionality are currently scarce.

Methods:

An intersectionality-based framework for evaluation of gender sensitivity in multivariable analysis and for future study design was developed. The framework comprises operationalisation of sex/gender, definition of solution-linked variables from a gender mainstreaming perspective, definition and function of intersectional variables and consideration of central gender theoretical concepts. For evaluation of current practice regarding sex/gender sensitivity in intersectionality-informed analyses, a scoping review within selected thematic fields relevant for heath reporting has been conducted.

Findings:

Based on 16 identified intersectionality-informed studies, sex/gender shows to be exclusively operationalised as binary. Solution-linked variables from a gender mainstreaming perspective are rarely taken into account. Sex/gender and race/ethnicity are the only intersectional variables considered in almost all studies, predominantly for stratification or as part of interaction terms. Income, education and employment status as proxies for social position as well as age are mainly used for adjustment in multivariable analyses.

Conclusions:

The framework allows for comparison of gender sensitivity in intersectionality-based multivariable analysis. The project AdvanceDataAnalysis at the Institute of Public Health and Nursing Research, University of Bremen, Germany, will contribute to the detection and analysis of complex interactions from an intersectionality perspective, including the consideration of gender theoretical concepts in multivariable analyses.

Operationalisation of gender and migration in epidemiological research – a systematic review

Lisa Wandschneider

L Wandschneider[1], *S Batram-Zantvoort*[1], *O Razum*[1], *C Miani*[1]
[1]Department of Epidemiology and International Public Health, School of Public Health, Bielefeld, Germany
Contact: lisa.wandschneider@uni-bielefeld.de

Background:

Gender as a social construct contributes to determine who migrates and which migration-related risks and opportunities emerge in all phases of the migration trajectory. Simultaneously, migration influences the individual as well as societal definition and perception of gender roles. An explicit gender perspective beyond biological sex in migration-related epidemiological research would contribute to adequately analyse, assess and interpret the health situation of migrants.

Methods:

The systematic review synthesises how gender is conceptualised, operationalised and used for interpretation in migration-related epidemiological research. We search PubMed, Embase, CINAHL, the Cochrane Library, EconLit and PsycINFO as well as the reference lists of the included studies. Eligible studies actively aim to understand, identify or explain the influence of gender on health.

Results:

20 cross-sectional studies met the eligibility criteria. The majority of studies analysed gender effects on mental health (e.g. depression) and sexual health (e.g. risk behaviour). The majority of the study population is made up of male sexual minorities with Latin American background living in the USA. Gender is mainly operationalised through gender roles, attitudes and gender-based discrimination. These dimensions are mostly conceptualised at the individual level, only a minority of studies applies meso- or macro-level indicators to measure structural gender effects.

Discussion:

We identified research gaps with regard to macro-level mechanisms of gender, immigrant populations in Europe and interactions of migration and gender in epidemiological research. The majority is restricted to sex- or sexual orientation related issues, but this systematic review helps to identify good practice examples that may contribute to the development of a guideline on how to integrate a gender perspective in migration-related epidemiological research.

Systematic Review Registration: PROSPERO CRD42019124698

Violation of maternal integrity during childbirth: a micro-, meso- and macrostructural perspective

Stephanie Batram-Zantvoort

S Batram-Zantvoort[1], L Wandschneider[1], O Razum[1], C Miani[1]
[1]Department of Epidemiology and International Public Health, School of Public Health, Bielefeld, Germany
Contact: stephanie.zantvoort@uni-bielefeld.de

Background:

Violation of maternal integrity (VMI) during childbirth is reported by women world-wide and reflects one aspect of gender-related violence against women. Terminology and concepts to describe VMI range from disrespect and abuse over mistreatment in childbirth to obstetric violence. The choice of terms might determine the scope of reference: while mistreatment encompasses rather interactional forms of VMI embedded on a microstructural level of society, obstetric violence includes a critical view on gendered power imbalances and is therefore considering cultural, political and economic exposures situated on macro- and meso-level. To identify different ways of explicitly integrating or implicitly reflecting micro-, meso- and macrostructural dimensions of VMI, we examine terminology, methodology and results in published research.

Methods:

For our review, we chose a meta-ethnographic approach, viewing studies on VMI as primary data in terms of defining, collecting, describing and analysing the phenomena of VMI. Our goal lies in first determining the explanatory model of each study and second synthesising these findings to outline a multilevel framework on maternal integrity.

Findings:

Studies predominantly concentrate on interaction-related determinants of VMI. To integrate macro- and mesostructural factors of VMI within a comprehensive framework, further epidemiological research on structural and social determinants of maternal health as well as interdisciplinary collaboration on the intertwining of gender imbalances in health care is needed.

Conclusions:

By differentiating between macro-to-micro-level factors of VMI, potential causes that go beyond the interaction level (e.g. policy, financial allocation, legal laws, maternal care conditions) can be identified to improve both research and implementation in obstetric care.

A critical discussion of theoretical foundations and measurement methods of gender roles

Philipp Jaehn

P Jaehn[1], S Cook[2], C Holmberg[1]
[1]Institute of Social Medicine and Epidemiology, Brandenburg Medical School Theodor Fontane, Brandenburg an der Havel, Germany
[2]Department of Non-communicable Disease Epidemiology, Faculty of Epidemiology and Population Health, LSHTM, London, UK
Contact: Philipp.Jaehn@mhb-fontane.de

Background:

Public health researchers have frequently investigated associations of individual gender role norms or attitudes with a variety of health outcomes. It has been suggested that the construct of gender roles is multidimensional, including norms about gender inequality and gender-related division of labour. Implications of multidimensionality and limitations of applied measurement methods, however, have rarely been discussed critically in published studies.

Methods:

I will summarise theoretical considerations about the multidimensionality of the construct of gender roles. Examples of recently applied approaches to operationalise gender role attitudes in mental health research will be presented. The talk will conclude with a discussion of advantages and limitations of these approaches regarding consistency with theory, applicability, and reduction of measurement error.

Results:

Gender role norms include assumptions about inequality and division of labour in the public and private sphere. Items about gender role attitudes are regularly included in questionnaires of large social surveys and are suitable to explore associations with disease occurrence or quality of healthcare. Data reduction methods such as factor analysis might be applied to differentiate dimensions and to reduce measurement error.

Conclusions:

Shortcomings in considering theoretical foundations and inconsistencies in operationalisation might have contributed to the limited recognition of findings about possible impacts of gender roles on health. We need to advance measurement methods to increase the quality of public health research on gender. Finally, aspects of gender on the contextual level should complement investigations of individual gender roles.

Lessons from the field: Gender roles and researcher reflexivity in smoking cessation in South Asia

Melanie Boeckmann

M Boeckmann[1,2,3], M Noor[4], R Zahid[4], F Firoze[5], P Shresthra[6], S Khanal[7], S Regmi[6], S Baral[6], H Elsey[3]
[1]Department of Environment and Health, School of Public Health, Bielefeld University, Bielefeld, Germany
[2]Institute of General Practice, Medical Faculty of the Heinrich-Heine-University Düsseldorf, Duesseldorf, Germany
[3]Department of Health Sciences, University of York, York, UK
[4]The Inititative, Islamabad, Pakistan
[5]ARK Foundation, Dhaka, Bangladesh
[6]HERD International, Kathmandu, Nepal
[7]IPAS Nepal, Kathmandu, Nepal
Contact: boeckmannmelanie@gmail.com

Background:

In South Asia, dual epidemics of smoking and tuberculosis (TB) have contributed to a high burden of lung disease. To address these health risks, the TB & Tobacco study uses the TB diagnosis as a teachable moment and implements a behaviour support counselling intervention, conducted by TB health workers, for patients in Bangladesh, Nepal and Pakistan. In this region, smoking tobacco is perceived as problematic for women, and being confronted with questions on smoking from a health professional may be uncomfortable for men and women. Anticipating these challenges, we incorporated gender sensitivity into training of health workers.

Methods:

During implementation of the cessation support in routine TB care, a process evaluation assessed interactions between participants and the intervention through interviews with health workers and patients with TB participating in the cessation program. This presentation focusses on a retrospective self-reflection on how we conceptualized gender roles based on prior research, and how research findings partially challenged these assumptions.

Findings:

While parts of our interview findings point towards smoking as a stigmatized practice for women and some men in South Asia as expected, several male and female respondents across socio-economic and geographical spheres contradicted this assumption. We discovered that health workers' self-efficacy and perceived smoking stigma among health workers influenced whether they discussed smoking with women or minors. Many patients, on the other hand, told us that they were interested in receiving help to cure their TB and were willing to talk to about smoking with their health workers and their family members.

Conclusions:

Patients in this study were more open to talking about smoking than anticipated. When including gender sensitivity into the standard training for health workers, we should be careful not to increase doubts in health workers about addressing smoking with women.

9.Q. Skills building seminar: Building skills and capacity for a future health workforce

Organised by: EUPHA (HWR)
Chair persons: Ronald Batenburg - Netherlands, Ellen Kuhlmann - EUPHA (HWR)
Contact: kuhlmann.ellen@mh-hannover.de

Background:

It is increasingly recognised that there is 'no health without a workforce' and that action has to be taken to develop an integrated and sustainable future health workforce. However, training and education opportunities are lacking for all those engaged in health workforce development. There is an urgent need for health systems and policy to foster skills building and institutional capacity for health workforce development to respond effectively to changing healthcare needs of the population and to the labour market shortages in many countries.

Objectives:

This seminar will address these issues and help reducing the knowledge gaps. The seminar is arranged around for major topics: the WHO framework for action to guide health workforce planning and governance, the competences framework to strengthen the education and professionalisation of public health developed by the WHO Coalition of Partners and ASPHER, the internationalisation of health professional education using medical education in Romania as a case study, and finally a framework for strengthening health workforce research. The seminar aims to help PhD students and early career researchers to develop skills in the field of health workforce research and development. It also provides knowledge and tools for policymakers and practitioners who are responsible for health workforce education and governance. This seminar will promote the development of training programmes for health workforce research and thereby contribute to public health leadership in health workforce development. There will be ample time for discussion and teaching material will be made available for the participants.

Key messages:

- Building skills and institutional capacity is key to improve health workforce research and policy.
- People-centred care and universal healthcare coverage call for new skills and education programmes.

Building institutional capacity for a future health workforce. The WHO Global HRH Strategy

Gabrielle Jacob

G Jacob[1]
[1]Human Resources for Health, Division of Health Systems and Public Health, WHO EURO, Copenhagen, Denmark
Contact: eurohrh@who.int

Background:

There is a growing recognition that the main population health challenges of sustaining universal healthcare coverage (UHC), and responding to the growing non-communicable diseases (NCDs) burden in all countries of the WHO European Region requires that each Member State has an effective, responsive and adaptive approach to human resources for health (HRH). However, there is a worldwide shortage of health workers and the situation is becoming more challenging globally and regionally. This presentation introduces the WHO Framework for Action, which builds on the Global Strategy on Human Resources for Health: Workforce 2030. The aim is to provide guidance to health policymakers, planners, analysts and others with a responsibility for health workforce issues.

Methods:

The WHO Global Strategy was adopted in 2018 by the 69th World Health Assembly. It has identified four strategic objectives, which have been adapted to the regional context as follows: to transform education and performance, to align planning and investment, to build capacity, and to improve analysis and monitoring.

Results:

The WHO Regional Office for Europe is working with Member States across the Region and supporting efforts to achieve sustainable health workforces. This includes promoting the use of the Labour Market Framework approach and maximising the utility of the National Health Workforce Accounts for national use and as a contributor to sustainable human resources for health planning.

Conclusions:

Having a sustainable health workforce in place with the right skills and competencies is critical to making progress towards achieving UHC. Effective implementation of a labour market framework approach, including multisectoral workforce governance, can support effective, responsive and adaptive approaches to human resources for health.

Professionalisation of the public health workforce: why, what and how

Kasia Czabanowska

K Czabanowska[1,2,2]
[1]Department of International Health, Maastricht University, Maastricht, Netherlands
[2]ASPHER, Brussels, Belgium
Contact: kasia.czabanowska@maastrichtuniversity.nl

Background:

Member States of the WHO European Region are calling for guidance on how to build the capacity of the public health workforce to help strengthening health systems. The aim of this presentation is to stir the discussion about the professionalization of the public health workforce. Attention is paid to the why, what and how this should be done in countries of the European Region.

Methods:

The European Competency Framework for the Public Health Workforce (Eco-FPHW) has been developed in the framework of the Coalition of Partners, led by WHO European Region, and is one of the pillars of the Roadmap to Professionalizing the public health workforce. The Eco-FPHW primarily relates to the core public health workforce, and that the definition of what constitutes the core public health workforce will differ from one country to the next.

Results:

The Roadmap puts forward several possible levers and measures which include: public health education and training, competencies, formal organisation, credentialing and accreditation, codes of ethics and professional conduct as well as laws and regulations, enumeration and job profiles among others. These measures can be engaged with by a range of stakeholders who have important roles and insights into improving public health. Stakeholders include governments, ministries, national and regional/local health authorities, but also directors of public health training institutions, public health institutes, professional organisations, and employers of the public health workforce.

Conclusions:

The Roadmap provides a guide for all those countries, institutions and organisations wishing to strengthen the delivery of the public health functions and to support the competencies of the public health workforce.

Internationalisation of health workforce education: the case of medicine in Romania

Marius-Ionut Ungureanu

M Ungureanu[1,3,2]
[1]Department of Public Health, Babeş-Bolyai University, Cluj-Napoca, Romania
[2]Health Management and Policy Center, Cluj-Napoca, Romania
[3]Early Career Researchers, EUPHA (HWR), Utrecht, Netherlands
Contact: marius.ungureanu@publichealth.ro

Background:

Long recognised as a major source country for health professionals working in Western EU Member States, Romania has become increasingly attractive for international medical students in recent years. The current study explores the drivers of this trend, its opportunities and challenges, as well as its implications on the broader health system goals.

Methods:

The study used secondary data analysis and interviews with key informants. Data originated in a study conducted for the OECD (grant no. EC-2017-5304 financed by the European Commission).

Results:

Since 2011, 11 of the 13 Medical Schools in Romania have opened additional study lines in foreign languages (English and French) and gradually increased the number of places allocated to international students. Of all new-entrant student places available in the medical schools in 2018/19, nearly 30% (1740 out of 6121) are in the international study programmes - a 50% increase since 2011/12. Moreover, while the total annual number of places for new medical students have increased by nearly a fifth between 2011/12 and 2018/19 (from 5,250 to 6,121), the share of new study places in the Romanian division has decreased from 80% to 70% in the same period. For Medical Schools, internationalisation has been driven mainly by financial reasons and has had a positive impact on curriculum development and improvement. For many international medical students, in particular nationals of the EU countries, the main push factors are the numerus clausus policies limiting access to medical education in their home countries.

Conclusions:

Internationalisation of medical education in Romania has taken place in the absence of a formal national internationalisation strategy and efforts have not translated into significant improvements in health workforce management in Romania. This suggests that potential benefits of internationalisation of health workforce education must be assessed in context of national health systems.

Researching the health workforce: a framework for action

Ellen Kuhlmann

E Kuhlmann[1,3], *R Batenburg*[4,5], *G Dussault*[6]
[1]Institute of Epidemiology, Public Health and Health Systems, Medical School Hannover, Hannover, Germany
[2]Department of Public Health, Aarhus University, Aarhus, Denmark
[3]EUPHA (HWR), Utrecht, Netherlands
[4]NIVEL, Utrecht, Netherlands
[5]Radboud University, Nijmegen, Netherlands
[6]Institute of Hygiene and Tropical Medicine, Universidade NOVA de Lisboa, Lisbon, Portugal
Contact: Kuhlmann.ellen@mh-hannover.de

Background:

The importance of a sustainable health workforce is increasingly recognised. However, the building of a future health workforce that is responsive to diverse population needs and demographic and economic change remains challenging. There is a need to improve research and education to address these questions effectively and build capacity for public health approaches in health workforce policy. This paper introduces an agenda for health workforce research.

Methods:

The research agenda has been developed through bringing together expertise and knowledge from a wide range of authors and leading organisations involved in health workforce research and policy. It takes a health system approach and focuses on Europe.

Results:

Six major objectives for health workforce policy were identified: (1) to develop frameworks that align health systems/governance and health workforce policy/planning, (2) to explore the effects of changing skill mixes and competencies across sectors and occupational groups, (3) to map how education and health workforce governance can be better integrated, (4) to analyse the impact of health workforce mobility on health systems, (5) to optimise the use of international/EU, national and regional health workforce data and monitoring and (6) to build capacity for policy implementation. The research highlights critical knowledge gaps that currently hamper the opportunities of effectively responding to these challenges and advising policymakers in different health systems. Closing these knowledge gaps is therefore an important step towards future health workforce governance and policy implementation.

Conclusions:

There is an urgent need for building health workforce research as an independent, interdisciplinary and multi-professional field. Action has to be taken to establish new training courses and Master programmes to create competences for leadership in health workforce research.

10.A. Workshop: Transforming four walls into bridges: embracing solidarity via prison health

Organised by: University of the West of England
Chair persons: Nasrul Ismail - UK
Contact: Nasrul.Ismail@uwe.ac.uk

The global population has grown by 20% over the last 15 years. At the same time, the prison population has increased by 30%. Circa 10.4 million people currently incarcerated in prisons worldwide. Despite being an opportunistic setting to gain access to a population at high risk of morbidity, the success of health interventions in prisons varies, while overcrowding and fiscal austerity have intensified the institutional struggle in recent years.

In keeping with the theme of ''building bridges for solidarity and public health'', this interdisciplinary panel of five diverse presentations will deliver a 90-minute workshop on prison health. It aims to examine the following questions: What is the public health approach to imprisonment? How have legal structures contributed to the improvement in prison health across Europe? What interventions work in terms of addressing the health deficits experienced by prisoners? What are the emerging threats to prison health policies and their delivery?

It has been 18 years since a prison health panel was convened at the EUPHA Conference. The time is now ripe for a new, radical investigation into these debates from research, policy and practice perspectives.

From a macro-level perspective, the first presentation will problematise imprisonment from egalitarianism and social justice standpoints, and analyse how health justice is everybody's business. Taking a legal and policy view, the second presentation will explore how the jurisprudence of the European Court of Human Rights over the last 20 years has influenced the international minimum standards on communicable diseases prevention in European prisons.

Drawing upon the meso-level interventions, the third presentation will illustrate how a horticulture programme can provide some antidotes to the high prevalence of violence, self-harm and suicide in UK prisons, by instilling the notion of hope among prisoners. Subsequently, through an analysis of 1,904 prisoners' longitudinal data from a study conducted in the Netherlands, the fourth presentation will articulate the importance of understanding individual and institutional risk factors in respect of prisoners' mental health in order to deliver timely interventions. The final presentation will assess how macroeconomic austerity solidifies prison health efficacy and deepens health inequalities at the micro level.

The majority of the panel members have a strong social media presence. With more than 20k followers on Twitter and Facebook, live updates on the key messages from this panel will be facilitated. Besides responding to conference delegates, the chairperson will field questions from social media platforms to promote an interactive experience.

This panel will reiterate that prison health is at the epicentre of the public health agenda. Giving it such proper deference will acknowledge that prisons are a microcosm of our society and demonstrate our solidarity with a segment of the community that is often excluded.

Key messages:

- This workshop offers the latest research, policy and practice developments on prison health.
- It will stimulate impactful debates in which learning can be adopted by delegates across European countries.

A public health approach to imprisonment

Nick de Viggiani

N de Viggiani[1]
[1]Centre for Public Health and Wellbeing, University of the West of England, Bristol, UK
Contact: Nick.DeViggiani@uwe.ac.uk

This presentation explores the contested meaning of ''prison public health''. European Public Health aligns itself with legal, ethical, political and economic principles that govern human rights, the rule of law and social justice. The UN Universal Declaration of Human Rights and the WHO Commission on the Social Determinants of Health infer an egalitarian approach towards social justice that supports rights of all citizens to have their basic needs met, unnecessary threats to wellbeing minimised, and social competence maximised. In the spirit of the WHO Ottawa Charter for Health Promotion, this means operationalising agency of individuals and communities and of the broad structural determinants of health: economic, political, legal and institutional.

In contrast, the law conventionally positions criminal responsibility with the individual perpetrator who is held responsible for their 'offending' behaviour. In parallel, arguments surrounding responsibility for health have abounded for many decades, with the principle of collective responsibility for health forming the ethos of the Ottawa Charter. Only recently has it been acknowledged that criminogenic and pathogenic 'determinants' intersect, criminal risk behaviours and health risk behaviours sharing common aetiologies.

This presentation will reinforce that a public health approach towards imprisonment is fundamentally egalitarian and commitment to social justice, recognising that structure and agency intersect and that the health of the prison is as important as that of the prisoner. It will argue that it is short-sighted to attend only to prisoner behaviour if the system surrounding the prisoner is failing in its duty of care and capacity to serve society.

Most prison populations represent the most vulnerable or disadvantaged sectors of society. Governments must proactively facilitate sustainable human development and protection and empowerment of vulnerable groups including those in custody.

The European Court of Human Rights and the protection of prisoners' health

Angus E. M. Wallace

AEM Wallace[1]
[1]Faculty of Law, Global Studies Institute, University of Geneva, Geneva, Switzerland
Contact: angus.wallace@unige.ch

The European Court of Human Rights (ECtHR) is a key actor in the regulation of prison conditions at the European level. Before 1998, the ECtHR did little more than legitimate state practice in terms of detention, no matter the effects on the health of those detained. Yet, since 1998, the ECtHR has recognised that prisoners are in a particularly vulnerable situation due to their almost total dependence on the authorities, and has defined a number of positive obligations that States are under to protect the health of prisoners.

Several reasons have been suggested for this evolution. Firstly, in 1998, the ECHR system was restructured and the ECtHR became a permanent court. Secondly, the Council of Europe's enlargement process to the East brought about an explosion in the number of applications from prisoners in post-soviet States complaining about severely inadequate prison conditions and overcrowded conditions. Thirdly, the ECtHR began to work more closely with Committee for the Prevention of Torture (CPT), an interdisciplinary body that looks to make structural changes to prison conditions and focuses on the effects on health to prisoners. In this connection, the ECtHR post-1998 also began to rely more heavily on external standards, such as CPT standards, WHO guidelines, and UN Minimum Standards to supplement its reasoning.

This study examines the dynamics between the ECtHR's normative standards of prison conditions and other international prison health standards by tracking the ECtHR's use of external materials in its assessment of the acceptability of prison conditions. It does so in the context of the ECtHR's jurisprudence relating to tuberculosis prevention, treatment and control in prisons.

Apart from standard improvement, preliminary results demonstrate an increase in the use of WHO documents corresponding with the evolution in the Court's thinking, and indicate that such documents are increasingly recognised as minimum legal requirements for governments to meet.

Nature-based health promotion: a valuable tool in prison partnerships

Michelle Baybutt

M Baybutt[1]
[1]Healthy and Sustainable Settings Unit, University of Central Lancashire, Preston, UK
Contact: MBaybutt@uclan.ac.uk

In the context of the current UK prison reform agenda and concern about the high incidence of violence, substance misuse, self-harm and suicide, prison-based horticulture can make a significant contribution to the creation of safe, secure, supportive and health-enhancing environments. By joining up health and justice agendas, therapeutic programmes have the potential to serve as powerful catalysts for wider systemic change, tackling inequalities and social exclusion within societies across the globe.

This presentation critically discusses findings from evaluative research, 'Greener on the Outside for Prisons' (GOOP), delivered in prisons in North West England. It aims to illustrate impacts of prisoners' participation in an innovative social and therapeutic horticultural programme. The qualitative study was informed by a theoretical exploration on socio-ecological model of health emphasising interconnections between environment, behaviour and wellbeing, recognising the dynamic interplay between situational and personal factors; by a psychosocial perspective, positioning the individual in networks of interpersonal relationships, organisations, and social, political and economic systems; and by insights from the Biophilia Hypothesis.

Findings suggest that engagement in GOOP were important to improvements in health and wellbeing with wider context-specific benefits. Working across key agendas of health, education and resettlement, GOOP has effectively demonstrated the potential of horticulture to impact positively on mental wellbeing, physical activity and healthier eating.

Additionally, it contributes towards social inclusion through the development of key transferable skills, life competencies, processes of socialisation, and preparation for successful resettlement and employment beyond prison, which are ultimately key determinants of future health and life chances.

The longitudinal course of prisoners' mental health problems during and after imprisonment

Anja J. E. Dirkzwager

A J E Dirkzwager[1]
[1]The Netherlands Institute for the Study on Crime and Law Enforcement, Amsterdam, Netherlands
Contact: ADirkzwager@nscr.nl

Mental health problems are common in prison populations. Correctional institutions offer an important opportunity to improve prisoners' health, which also benefit the wider public health agenda. At present, little is known about the longitudinal course of prisoners' mental health problems during and after imprisonment. The aims of this presentation are: (a) to examine the longitudinal development of mental health problems in prison and after release; and (b) to identify individual and institutional factors associated with prisoners' mental health problems.

Data are used from the Prison Project, a nationwide and longitudinal study examining 1.904 male prisoners in the Netherlands. Participants were surveyed at various intervals during detention, and 6 and 24 months after their release. Data include detailed longitudinal information on prisoners' self-reported mental health problems, healthcare use, prison experiences (e.g. sentence length, victimisation, receiving visits, and exercise), and background characteristics (e.g. sociodemographic characteristics, financial situation, social support, and personality traits).

Prisoners reported more mental health problems in and after prison than men in the general population. Initial results demonstrate that prisoners who entered detention with pre-existing mental health problems and problematic alcohol and drug use, showed mental health improvements during detention. The high levels of prisoners' mental problems highlight the importance of addressing mental issues in prison and ensuring the continuity of care to support prisoners with their transition into the community.

Impact of austerity on prison health in England: a qualitative study involving national policymakers

Nasrul Ismail

N Ismail[1]
[1]Centre for Public Health and Wellbeing, University of the West of England, Bristol, UK
Contact: Nasrul.Ismail@uwe.ac.uk

Prisons offer states access to a population that is at high risk of morbidity. The UK austerity policy adopted in 2010 led to a 22% reduction (-£2.71bn) in prison spending by 2017. Whilst the number of prison officers dropped by 30%, the long-term impact of austerity on prison health in England has not been systematically contextualised. This research seeks to articulate the impact of austerity on prison health in England from the perspective of national policymakers.

Semi-structured interviews (X: 66 min) were conducted with 30 key prison policymakers. Constructivist grounded theory was used to assess the impact of austerity on prisoner health in England. Transcripts of 195,680 narrative texts were analysed using NVivo 11 until data saturation was achieved.

As a stealthy political ideology, austerity has caused societal disruption, which disproportionately affects prisons. The lack of access to services offered by the welfare state, including health-related provisions, precipitates societal unrest, increases prisoner numbers, and encourages harsher and longer sentences.

The prolonged constrained funding and the burgeoning population widen health inequalities in prisons. Healthcare provisions become increasingly limited, which unduly affects older and female prisoners who require more complex support. The degrading living conditions and lack of purposeful activities contribute to the increasing violence, self-harm and suicides in prisons, and reorient the healthcare provision from planned services to health emergencies. The excessive focus on Brexit and the perpetual changing political direction imposed on prisons reinforce the system's instability. Despite having the fifth largest economy in the world, England's poorest population continues to bear the brunt of austerity. Initiating a more informed economic recovery policy and considering alternatives to imprisonment would help to ensure that England lives up to its view of itself as a progressive society.

10.B. Workshop: Active participation of migrants, refugees, and ethnic minorities in public health research

Organised by: University of Bern
Chair persons: Thomas Abel - Switzerland, Annika Frahsa - Germany
Contact: annika.frahsa@uni-tuebingen.de

To introduce the relevance, benefits and challenges of participatory approaches in public health research addressing issues of migrant and refugee health. Participation of stakeholders has a long tradition in fields of public health research, in particular in community-based research and health promotion. Today, increasing demands of grant agencies and policymakers in Europe challenge researchers to include stakeholders in all processes of health research. Active participation of migrants and refugees poses complex challenges for public health research including but, going beyond language problems and risks of stereotyping.

The specific objectives of this workshop are: (1) to introduce current approaches for participation and their adaptability for the context of health research with migrants and refugees, (2) to explore participation in three projects that deal with issues like improving quality health care among chronically ill women with immigration background, introducing a health mediator model for refugees as well as ethical issues in participatory research with refugees and ethnic minority groups and (3) to discuss benefits and challenges of participatory approaches intended to improve health and health care services of specific groups.

The workshop will start with an introduction providing a short overview of definitions and key concepts. Substantive presentations showcase three participatory projects in migrant health. A panel discussion, led by experienced moderators, with Prof Thomas Abel (PI of the MIWOCA project presented), Prof Antonio Chiarenza (WHO-HPH Task Force on Migration, Equity & Diversity, member of the Steering Committee of the EUPHA section on Migrant Health), Prof Luis Saboga-Nunes (EUPHA health promotion section) and Prof Sibel Sakarya (Department of Public Health Koç University) will address benefits and challenges of participation in migrant and refugee health research. The panel will open into a discussion to integrate audience's experience and questions on participatory research. The workshop will be closed by the chair's summary of lessons learnt and perspectives for future directions.

Key messages:

- Public health research for and with migrants and refugees poses basic and specific challenges.
- Experience with PR demonstrates the benefits of migrants' and refugees' active participation and the importance of adequate contextualizing of the problems and potential solutions.

Community-based participatory health research: principles and practice

Hella von Unger

H Unger[1]
[1]Institute of Sociology, LMU Munich, Munich, Germany
Contact: unger@lmu.de

Community-based participatory research (CBPR) is a collaborative approach to research that aims to improve the health of marginalized communities and reduce health disparities. It starts with a topic of concern for the community and involves iterative cycles of action and reflection to initiate change. Community members are involved as partners and trained as peer researchers to take an active role in the research process. Processes of capacity building and empowerment play a prominent role. As a general principle, participatory research does not primarily focus on health problems, but pays at least equal attention to the resources and capacities of communities. It places a strong focus on developing trust and reciprocity in research relationships.

Regarding methodology, various empirical research methods are used in CBPR study designs, including qualitative, quantitative, mixed-methods and arts-based methods. Arts-based methods such as photovoice, digital storytelling, mapping and drawings facilitate the expression of lived experience, including sensitive aspects, through creative verbal and non-verbal means. These methods expand the available means of expression and as such are highly valuable in research fields where verbal communication is challenged by language barriers and diverse cultural backgrounds as well as sensitive topics and experiences. Participatory health research has been conducted with diverse migrant and refugee groups internationally. Due to legal and other reasons, refugees may be limited in their capacities for participation. The presentation will discuss the strengths and limitations of CBPR including structural obstacles to equitable partnerships.

The co-design approach in the MIWOCA project

Annika Frahsa

A Frahsa[1], *R Farquet*[2], *T Abel*[2]
[1]Institute of Sport Science, University of Tübingen, Tübingen, Germany
[2]Institute of Social and Preventive Medicine, University of Bern, Bern, Switzerland
Contact: annika.frahsa@uni-tuebingen.de
MIWOCA study group

Background:

The project MIWOCA researches how chronically ill women of Portuguese, Turkish and German origin and women without a migration background subjectively experience, understand, interpret and use the Swiss health care system.

Methods:

We conducted 48 qualitative semi-structured interviews with chronically ill women between the ages of 23 and 85 in Bern and Geneva (n = 36 with German, Portuguese and Turkish migrant backgrounds) and n = 12 Swiss women. In addition, n = 12 stakeholder interviews were conducted (doctors, nurses, social workers, psychologists, physiotherapists). In focus groups with interviewed women in Bern and Geneva, results are reflected back, identified topics from the interviews prioritized and representatives named for the cooperative planning. In a participatory planning approach, affected women in the canton of Bern, together with stakeholders from the Swiss healthcare system selected by a systematic stakeholder analysis (e.g. Swiss Medical Association, Red Cross Switzerland, Spitex, Federal Office of Public Health), develop recommendations for improving the quality of care and concrete dissemination strategies.

Results:

Interviewees had multiple and chronic diseases and resulting extensive experience with the Swiss healthcare system. Relevant aspects referred to issues such as quality of specific services, complexity of the healthcare system, costs of care, role of family and social support, and multidimensional stigmatization (migration, chronic illness, alleged overuse of the care system). Findings are incorporated in evidence briefs and narrative stories for focus groups and participatory planning.

Conclusions:

MIWOCA contributes to a targeted and differentiated improvement of structures and options for action in health care for specific groups. Results will be relevant for planning in the health system and may be incorporated into academic teaching and practical training in PH, medicine and social sciences.

Structural and ethical challenges in participatory research with migrant and minority groups

Nora Gottlieb

ND Gottlieb
[1]Department of Health Care Management, Technical University Berlin, Berlin, Germany
Contact: nora.gottlieb@tu-berlin.de

Based on experiences with participatory research projects with forced migrant and ethnic minority groups in Germany, Israel and Canada, Dr. Gottlieb will first reflect on the structural challenges that especially young researchers face when doing - or intending to do - participatory research. Secondly, she will discuss ethical issues that can arise in participatory research, in particular when grave inequalities, fragmentations and conflicts within the researched communities exist. In such contexts, certain generally valid research ethical questions merit particular attention; e.g. the questions 'Who represents whom?', 'Who gets access to the research process and its benefits?' and 'How are direct and indirect benefits distributed among different community members?' Another set of questions concerns potential discrepancies between common goals in participatory research - such as empowerment, agency, leadership and innovation - and community norms. E.g., what is the risk of participatory research projects intensifying existing internal, e.g. intergenerational or gender-based, rifts and/or getting their practice partners into conflict with their communities and customs? To what extent ought research encourage individuals within a community to "go against the stream"?

In light of (post-)colonial histories and trauma such questions can be especially charged, both politically and emotionally. It is therefore a huge responsibility for the researcher to carefully consider the role of the study within its wider context, to weigh its potential (intended and unintended) effects and broader outcomes on individual and community levels, and to balance them with the study goals and intended benefits and its consequences for health research.

Health mediator model as a way to access to care and health information for Syrian refugees in Turkey

Ilker Kayi

I Kayi[1], *Z Şimşek2*[2], *G Yıldırımkaya*[3]
[1]School of Medicine, Koc University, Istanbul, Turkey
[2]Vocational School of Health Services, Bilgi University, Istanbul, Turkey
[3]UNFPA Turkey, Istanbul, Turkey
Contact: ikayi@ku.edu.tr

The number of Syrian refugees residing in Turkey has increased over 200 times since 2012 reaching to 3,621,330 (April 2019). Turkey has granted temporary protection status, including access healthcare in the city of registration. Ministry of Health provides on-site health service in temporary shelters, however more than 90% of the Syrian refugees choose to stay in community settings, which along with language barriers limits their ability to access health care and information.

With UNFPA we have designed a health mediator model to improve access to health care and awareness on priority concerns such as mental health, reproductive health, child health, health system in Turkey and legal status provided to Syrian refugees. This study is a participatory operational research to test the health mediator model. Operationalization took place in 3 phases: (1) selection and training of Syrian health mediators and provincial coordinators; (2) household visits and data collection; (3) evaluation and supervision.

So far, we have trained 174 health mediators from 24 different Turkish cities. Training took 5 days with up to 30 participants each. UNFPA collaborated with NGOs that work with Syrian refugees for coordination purposes. Health mediators made household visits to reach out to Syrian families, gave health education and where necessary support for access to health care services, and conducted a needs assessment. Data collected has been the subject to weekly supervision meetings by local NGOs, health mediators and coordinators to set priorities for the upcoming week.

Health mediator model was effective in reaching out to hard-to-reach groups among Syrian refugees, increased health system and legal awareness, contribute to improved healthcare access and prevention of negative health outcomes such as teenage marriages and pregnancies.

Inclusion of refugees in decision-making and guidance during the implementation of the project was key for project success.

Applying Community Based Participatory Research on sexual health & sexual violence with refugees, asylum seekers and undocumented migrants in Europe and the European Neighbourhood

Ines Keygnaert

I Keygnaert
[1]Department of Public Health & Primary Care, Ghent University, Ghent, Belgium
Contact: Ines.Keygnaert@ugent.be

Background:

Refugees, asylum seekers and undocumented migrants are at risk of sexual violence (SV). SV can induce ill-health in the victims, their offspring and community. However, prevention and response actions are leaping behind and rarely tap on the agency of the migrants themselves. Community Based Participatory Research (CBPR) is a collaborative research approach in public health that focuses on inequalities and aims to improve the health and well-being of community members by integrating knowledge in action, including personal, social and policy change.

Methods:

Building on the concept of Desirable Prevention from a human-rights and gender-sensitive perspective, in three consecutive projects we applied CBPR to study SV and sexual health (SH) and collegiately developed SV prevention and response tools for personal, social and policy change.

Results:

Each of the three CBPR projects was steered by local Community Advisory Boards composing of key stakeholders. With 1001 Community Researchers being refugees, asylum seekers, undocumented migrants and asylum reception professionals themselves we collegiately conducted the mixed-method research and co-created the tools that were validated at largely attended public seminars and implemented widely. While the projects clearly resulted in social and policy change, several professional researchers personally struggled with the principle of co-learning and co-creation while migrants struggled with the regained respect and identity that fell away beyond project scopes and in between project resulting in poor mental health in some.

Conclusions:

Applying CBPR with refugees, asylum seekers and undocumented migrants on sensitive topics as SV and SH is a valuable research approach. Yet, the CBPR principles of cyclical participatory processes and the commitment to sustainability might clash with the current funding and timing of EU research projects challenging participants' mental health and researchers' ethics.

10.C. Workshop: EUPHA and Europe-wide action on digital public health

Organised by: EUPHA (DH)
Chair persons: Dineke Zeegers Paget - EUPHA, Anna Odone - Italy
Contact: anna.odone@mail.harvard.edu

The World Health Assembly Resolution on Digital Health unanimously approved by WHO Member States in May 2018 demonstrated a collective recognition of the value of digital technologies to contribute to advancing universal health coverage (UHC) and other health aims of the Sustainable Development Goals (SDGs). The World Health Organization has just released first ever guideline on digital interventions for health system strengthening.

Et the European level, in June 2018 the WHO Regional Office for Europe launched the WHO/Europe initiative for Digitalization of Health Systems and in February 2019 organized the first Symposium on the Future of Digital Health Systems in the European Region. The European Commission in April 2018 published a Communication on Digital transformation of health and care in the digital single market and requested the Expert Panel on effective ways of investing in health (EXPH) to release an evidence-based opinion on how to assess the impact of digital transformation of health services.

In such context, the European Public Health Association (EUPHA) has at an early stage acknowledged and understood the crucial importance of applying the potential offered by digitalization to public health. Not only its most prominent members work and research as WHO and EC experts on how to plan, implement and evaluate effective digital public health interventions, but EUPHA itself - as umbrella organization representing public health associations and institutes across Europe had: i) actively participated to the WHO Euro Symposium successfully co-organizing a session on the 'beautiful marriage' between digitalization and public health, ii) supported the publication of a EJPH supplement on digital health and iii) has planned to create a EUPHA Section on Digital Health.

With the overall goal of positioning the proposed EUPHA Section on Digital Health in the enriching and constructive context of the European Public Health Conference the workshop specifically aims to:

- present a comprehensive conceptual framework for the application of digital technologies to public health in Europe;
- present and report on EUPHA collaborative action on digital health, aligned with European institutions;
- present the structure and content of the EJPH supplement on digital health;
- present the general aim, specific objectives, scope, mission and preliminary outputs of the proposed EUPHA Section on Digital Health, as well as its synergy with other EUPHA's Section work
- Present the results of two/three specific projects on digital public health to serve as concrete examples of the application of digital solutions to public health
- Engage with the audience to promote the active participation of the broader EUPHA community to the activities of the Section, collect interests and best practices, and share ideas and projects worth scaling up at the Section-level.

Key messages:

- The 'beautiful marriage' between digitalization and public health has to be concretely planned, implemented and evaluated.
- EUPHA action on digital public health can be further strengthened through the collaborative action and work of its dedicated Section.

Presentation of the European Journal of Public Health 2019 supplement on Digital Health

Natasha Azzopardi Muscat

10.D. Round table: International capacity building to boost public health: Can we join forces and share know-how?

Organised by: University of Southern Denmark, Babes Bolyai University, Romania
Chair persons: Arja Aro - Denmark, Razvan M Chereches - Romania
Contact: araro@health.sdu.dk

Background:

European Universities are increasingly running or participating in capacity building in higher education in non-EU countries. These projects are funded by EC, US National Institutes of Health (NIH), governments, universities or private sector. Capacity building provides a way to build global bridges between public health communities; it increases cultural understanding, develops resources in the neighboring countries and prevents public health problems spreading to Europe. For the collaborating countries it empowers communities and enhances equity and solidarity. To pool together the expertise and lessons learnt by the universities delivering this kind of education, a roundtable discussion at EUPHA offers a good forum.

Aim:

To create a forum where public health academics, adult pedagogic experts, policymakers and practitioners gather to share experiences, interests and ideas for potential collaboration to facilitate the export of public health training across countries and cultures. Based on this, the round table will increase sharing knowledge and transparency of results of international capacity building interventions and will contribute to the transcultural fertilization of the interventions, with a special focus on solidarity in health. We will present specific ways of how to do knowhow transfer from EU countries to some other parts of the world (Northern Africa, Arabian Peninsula and the Caucasus region).

Program:

An introduction to the roundtable is given by Professor of Public Health Arja R Aro (SDU, Denmark). She will describe recent developments and multiple lines of funding options for international capacity building projects. Professor Razvan Chereches (BBU, Romania) will talk on the lessons learned in an ongoing public health capacity building project among medical faculty staff funded by EC Erasmus+ program in Tunisia. Dr Diana Dulf will present the lessons learned in capacity building projects funded by NIH in Armenia and Georgia in the area of injury prevention. Arja R Aro will tell about the recent and ongoing knowledge transfer and education export projects among undergraduates and health professionals in Saudi Arabia funded by local universities. Pedagogical expert Anne Leena Ikonen will reflect on the pedagogic challenges in capacity building across cultures, using the Saudi Arabian context as an example. After that the panel will discuss the main lessons learnt and challenges encountered, and the audience is invited to ask questions, to share their experiences and interests. The roundtable will finish by discussing options to get organized as a network or interest group around international capacity building in public health, potentially under EUPHA.

Key messages:

- Pooling lessons learnt will help towards better and cost-effective planning of the future training.
- Network or interest group can offer a platform for collaboration and enhancement of European public health training and export.

Capacity building in the field of public health in Tunisia: processes and challenges

Razvan M Chereches

R Chereches[1]*, MA Coman*[1]*, O Oltean*[1]*, E Bozdog*[1]
[1]Department of Public Health, Babes-Bolyai University, Cluj-Napoca, Romania
Contact: razvan.chereches@publichealth.ro

Introduction:

Capacity building activities between 3 Tunisian Medical Faculties (University of Sfax, University of Tunis el Manar and University of Sousse) and 3 European Universities (Babes-Bolyai University, University of Southern Denmark and Trnava University) began in 2017 in the framework of an Erasmus+ project. The aim of the collaboration is threefold: first, Tunisian partners were assisted in developing the infrastructure of the Centre for Evidence into Health Policy (C4EHP); second, EU- Partners delivered the Research into Policy training programme with 3 modules: public health research methods, evidence-based policymaking and health promotion policies. The program consisted of train-the-trainer and train-the-trainee sessions; third, partners are continuously working on strengthening the collaboration between the academic and non-academic sectors in the field of public health.

Lessons learnt:

Developing the C4EHP contributed to the official recognition of the research structure in the partner Universities. The challenges faced were administrative and legislative national procedures and delays in the equipment delivery and instalment. The train-the-trainer sessions empowered the 18 Tunisian participants to acknowledge their importance in the development of the public health field. Knowledge transfer faced challenges due to differences in the culture and working process, adhering to deadlines, communicating via email as well as due to language barriers. The capacities were, however, strengthened when the trainers started teaching themselves and delivered the train-the-trainee sessions. We observed a level of distrust from the non-academic sector due to previous international projects, unrelated with the current project or implementation team, and which had elicited little to no impact. Development of local collaboration between academic and non-academic sectors needs to be explored deeper.

Increase Capacity in Injury Research in Eastern Europe – the iCREATE Project

Nino Chikhladze

D Dulf[1]*, MA Coman*[1]*, C Peek-Asa*[2]*, S Switzer*[3]*, N Chikhladze*[4]
[1]Department of Public Health, Babes-Bolyai University, Cluj-Napoca, Romania
[2]Department of Environmental Health, University of Iowa, Iowa City, Iowa, USA
[3]Global Health Program, University of Iowa, Iowa City, Iowa, USA
[4]Faculty of Medicine, Ivane Javakhishvili Tbilisi State University, Tblisi, Georgia
Contact: nino.chikhladze@tsu.ge

Introduction:

Injury rates are highest among LMICs. Many of the leading injury causes are increasing disproportionately in LMICs compared with high income countries. Although medical and public health education in each of these countries has been growing over the last several years, injury and violence prevention has not yet been recognized as a priority. The iCREATE project aims to create a critical mass of injury researchers from multiple disciplines and to engage agencies and stakeholders in conducting high impact research that reduces the burden of injuries and violence in the LMICs of Armenia, Georgia, and Rep. of Moldova.

Progress:

Based on priority needs in our partner countries and the expertise of the training team, the project focuses on: road traffic injury prevention, prevention of violence against women and children and acute care. Although it is the first project of capacity building in injury research implemented in these countries, the partnership builds on and translates existing successful infrastructure. The lead of the project (University of Iowa) has conducted similar projects in other countries from Eastern Europe and one of the training sites (Babes-Bolyai University) is currently a partner in the project.

Activities include skill-building workshops; summer classes; long-term degree-based and professional development training; focused exploratory research projects; and collaborative data infrastructure projects. The focus is on long-term MPH and PhD training in order to build research and leadership skills focused on injury prevention in the partner institutions. Some results of the first three project years are implementation of Injury prevention Curricula in three medical universities from the partner countries, and a Center of Injury and Violence Prevention established in Armenia. Furthermore, 33 trainees were trained, 8 hospitals implemented injury registries and 12446 registry records were collected so far across 3 countries.

Capacity building in public health with two Saudi universities: Challenges of knowledge transfer

Arja Aro

AR Aro[1]*, M Palianopoulou*[1]*, AL Ikonen*[2,1]*, L Eklund Karlsson*[1]
[1]Unit for Health Promotion Research, University of Southern Denmark, Esbjerg, Denmark
[2]Faculty of Education and Psychology, University of Jyvaskyla, Jyvaskyla, Finland
Contact: araro@health.sdu.dk

Introduction:

Collaboration between SDU and two Saudi Arabian (KSA) Universities started in 2012. Case 1 was a new public university for women; the contract (until spring 2017) aimed at knowledge transfer from SDU to two Bachelor of Science curricula (Epidemiology, and Health Education and Promotion). The aim was to train the trainers by teaching the 1st student cohort 100% by the SDU staff and for later cohorts to increase the teaching by local staff gradually. The SDU teams travelled to KSA to run 1-month courses at a time. In Case 2 (ongoing since 2017), 1-week courses for health professionals are offered in an established mixed-gender university; the courses are for a fee.

Lessons learnt:

In case 1, knowledge transfer was challenging, since the local staff was busy ‘with their own courses’ and had low interest to learn from SDU. The SDU and the local group were working as separate teams. The local staff saw knowledge transfer as receiving the slides and other material from SDU. Only in the 5th contract year, interaction started mainly via staff capacity building workshops organized by SDU. The students appreciated the SDU teaching, and on the administrative level collaboration worked very well. Due to the lack of ownership among local teachers and deficits in cultural adaptation on-site, knowledge transfer was not successful.

In case 2, different cultural approaches seem to clash; SDU prefers to market the courses early and e tailor them for the target groups; the Saudi cultural tradition relies less on organized marketing and is flexible with the registration deadlines. For the 1st course, this meant that the SDU team travelled to KSA without knowing who and how many participants had signed up. Learning the background of the participants only when the course started meant that the teaching was finalized from day-to-day while running the course. In the end, based on the course evaluation, the 9 participants were very satisfied with the course.

Experiences and pedagogical considerations of training the trainers in Saudi Arabia

Anne Leena Ikonen

A Ikonen[1,2], L Eklund Karlsson[2], M Palianopoulou[2], AR Aro[2]
[1]Faculty of Education and Psychology, University of Jyvaskyla, Jyvaskyla, Finland
[2]Unit for Health Promotion Research, University of Southern Denmark, Esbjerg, Denmark
Contact: leena.a.ikonen@jyu.fi

Introduction:

A student-centered teaching method engages the student to take responsibility for his/her own learning. In this pedagogical approach, the role of the teacher has become to be a supportive coach rather than an authority and one-way superior knowledge provider. A teacher with good teaching skills actively involves and engages students in the learning process. Qualified teacherś competence consists of the substance of the subject taught, pedagogical skills as well as of the teaching experience gained after teacher training.

Lessons learnt:

In our case we organized a 9-day workshop to enhance the teaching skills of teachers in one department of our collaborator university in Saudi Arabia (KSA). The workshop included lectures on-site and individual and group assignments such as integrating active learning methods into teaching. The pedagogical workshop was a part of the cross-cultural knowledge transfer project between SDU and (case 1) university in KSA in the Bachelor level education in 2013-2017. The project disclosed the cultural differences in teaching and learning and the different traditions of education. We found that there was a strong tradition of memorizing among students in KSA, which reflected into the attitudes of both teachers and students.

This workshop was the first pedagogical training for the most of participants and it revealed that they lacked theoretical knowledge on teaching, e.g. the concepts of student-centered teaching were new to the participants. However, they had extensive teaching experience and strong knowledge of the content of the subjects taught. The acquired knowledge of the basic approaches of student-centered teaching expanded participantś thoughts on how they could better interact with students instead of one-way lecturing. In the workshop, dialogue was used as a teaching method, and participants found the sharing of learning experiences in a peer group a useful and new way to learn at work.

10.E. Workshop: Political parties, health and influence in the EU

Organised by: EUPHA (PHPP)
Chair persons: Marleen Bekker - EUPHA (PHPP), Sofia Ribeiro - Portugal
Contact: marleen.bekker@wur.nl

In light of the 2019 European Parliament elections, signs of a deteriorating public health and the rise of populist radical parties elected in office in some Western countries, this urgent workshop focuses on making sense of the impact of politics on public health.

There is a clear need for in-depth understanding and more effectively engaging with political processes that affect health. Political science articulates the understanding and improvement of the conditions under which politics is able to produce effective and legitimate solutions to policy problems. It involves a systematic inquiry into basic features of the political economy such as institutions, partisanship and the organization of labour markets. Understanding this political landscape of public health helps to define the political options for organizing effective influence on healthy policies and outcomes.

One component in this health political landscape is that of political parties and partisanship. Political parties structure modern politics because they are the teams on which politicians compete for power. They mattered enormously in the post-war years of stable party systems, and their more recent crises and reconstitutions also matter enormously (as a quick look around Western Europe should show). Politicians, and parties, are motivated by the electoral imperative to seek and stay in office. Once elected, politicians on any issue will be looking to claim credit for good outcomes and avoid blame for bad outcomes. If the issue is one that lacks ‘traceability’ such that it produces no obvious credit or blame, politicians will take positions that please their followers and target voters.

This workshop presents five studies on political parties and health, asking the questions ‘Do political parties matter to health? What do political parties talk about when they talk about health? And what do they actually do to health?’ In three studies a health screening was performed on political party manifestos and electoral programmes with additional explorative interviews. Two other studies dive into the academic literature on political parties and partisanship and their presumed effect on health and welfare policies.

After these five presentations the panel, consisting of dr. Natasha Azzopardi Muscat, dr. Holly Jarman and prof Scott Greer, will briefly reflect upon the findings and implications for public health policy and politics. The participants of the workshop will be engaged in an interactive discussion with the panel and presenters focusing on the questions of (a) whether and how, in participants’ home countries, (radical and other) political parties address and affect health and welfare policies; (b) how participants can analyse this themselves; and (c) how they can act upon this evidence.

We end the workshop with five key messages for follow up research and strategy.

Key messages:

- The 2019 European Parliament elections, signs of a deteriorating public health and the rise of populist radical parties provide opportunity and necessity to understand and influence health politics.
- Political party manifesto screening detects possible public health opportunities and threats, but party influence on policies is mediated by party system requirements varying across countries.

A health screening of European political party manifestos to inform priorities and strategies for influence

Nina Bos

N Bos[1,3], MPM Bekker[1,2]
[1]Health and Society group, Wageningen University and Research, Wageningen, Netherlands

[2]Health Services Research, Maastricht University, Maastricht, Netherlands
[3]EUPHA, Utrecht, Netherlands
Contact: ninabos@gmail.com

Background:

The European Parliament (EP) elections gave way for a new political cycle for the European Union (EU), and thus for public health (PH); an area 70% of the European citizens want the EU to do more on. This research clarifies if and how EU political parties prioritise health and where the gaps are.

Methods:

A literature search was undertaken to 1) gain insight in which sectors the EU can establish policy impacting PH, 2) map actors that play a role in PH policy, and 3) find building blocks for a receptive environment. Four interviews were held with NGOs. Eleven EU political parties' manifestos were thoroughly screened and two interviews were held with MEPs of two different parties.

Results:

Eight sectors were identified in which the EU has (shared) legislative power and can positively impact PH. How these policies are packaged depends on who places their beliefs on the EU agenda. Actors in the political arena such as, parties that will dominate the EP, the Member States, NGOs, and epistemic communities need to make use of building blocks such as trusting relationships, broad and long term coalitions between different actors, and effective translation of expert knowledge, in order to create a receptive environment. In the manifestos health is (in)directly touched upon, but not prioritised. They look beyond the medical sector, but whether plans are meant to be linked to PH improvements is not always clear. MEPs are keen to prioritise health more at EU level, but respect the EU's health competences.

Conclusions:

Health is recognized by parties as relevant in non-medical sectors, which offers positive perspectives for the future, as other EU sectors' policy can impact public health. The agenda-setting of health can be boosted by organizing actors in such a way that they create receptive environments amongst each other.

An analysis of Croatian political parties' pre-election manifestos and healthcare policies

Damir Ivankovic

D Ivankovic[1], S Handanagic[2], A Dzakula[2]
[1]Department of Public Health, Amsterdam UMC-AMC, Amsterdam, Netherlands
[2]Andrija Stampar School of Public Health, University of Zagreb, Zagreb, Croatia
Contact: divankovic@gmail.com

Background:

Before the regular 2015 Parliamentary elections in Croatia, we identified and analysed topics and comprehensiveness of health policies (HPs) included in political parties' pre-election manifestos. After the loss of government confidence, we did a follow up before the 2016 preliminary elections. Here, we present a comparison of the 2015 and 2016 results.

Methods:

We used the Walt-Gilson policy model for the content analysis of pre-election HPs. Five evaluators independently reviewed manifestos for HPs through four dimensions: content, actors, processes and context. HPs proposed by at least two parties were included in the final analysis and by referring to any of four dimensions for specific HP, parties scored one point (maximum of four points per HP).

Results:

Seven out of the eight parties addressed healthcare topics in their manifestos, six discussed healthcare workforce and financing, while five discussed hospital systems, primary care, medical equipment and (re)organization of the healthcare. Parties earned 41% of all points for describing content, 28% for processes, 17% for actors and 14% for context of proposed HPs. Compared to the 2015 results, most comprehensively approached HPs changed to more focus on workforce and medical equipment. Topics of access to healthcare and people with disability earned significantly less points than in 2015.

Conclusions:

Parties' manifestos in both 2015 and 2016 focused on topics mostly represented in the public discourse on healthcare and daily media coverage. Financing the 2015 elections, as a consequence of a large financial restructuring effort of the hospital system at the time. Health workforce topped the 2016 elections, due to large emigration of health care professionals after legislative changes and Croatia's accession to the EU. Parties mostly focus on the content while they less frequently address the role of processes, actors, and the context needed for successful implementation of the recommended HPs.

Health in the 2018 Italian general election

Stefano Guicciardi

S Guicciardi[1], M Quargnolo[1], G Moser[2], R D'Avenia[2], F Toth[3], M Pia Fantini[1]
[1]Department of Biomedical and Neuromotor Sciences, University of Bologna, Bologna, Italy
[2]Department of Primary Care, Bologna Local Health Authority, Bologna, Italy
[3]Department of Political and Social Sciences, University of Bologna, Bologna, Italy
Contact: stefanoguicciardi.mail@gmail.com

Background:

General elections represent a peculiar moment in which clear positions on relevant topics are more likely to emerge. Therefore, they may serve as a reference point to monitor policy development and to verify decision makers' accountability.

The aim of this study is to systematically examine the proposals on health issues in the manifestos of the 38 parties running in the 2018 Italian general election, comparing them with the contents shared on social media.

Methods:

All the electoral manifestos published on the websites of each party and of the Italian Ministry of the Interior were collected and independently assessed by four evaluators.

A list of 48 health themes grouped into 13 main domains into was then consensually created and used to classify the reported proposals.

Parties' official social media accounts (Facebook and Twitter) were subsequently screened for selected keywords to determine the frequency and the content of health-related posts.

Results:

Thirty out of 38 parties included a specific section on health in their programmes or generally addressed healthcare topics. The most covered themes were health promotion and lifestyles, self-sufficiency of fragile populations, management of private healthcare and health workforce, although implementation strategies varied greatly and only in a few cases it was possible to compare them.

On social media, health related posts represented less than 1% of the contents shared by any party during the election campaign.

Conclusions:

In the 2018 Italian election campaign the majority of the parties' manifestos explicitly addressed health issues but, apart from a few exceptions, significant differences were present in the themes and in the proposed solutions, mostly generic. On social media health was almost neglected. Despite its social relevance, health played a marginal role in the 2018 Italian election campaign.

Do political parties matter to health?

Michelle Falkenbach

M Falkenbach[1], MPM Bekker[2,3], SL Greer[1,4]
[1]Health Management and Policy School of Public Health, University of Michigan, Ann Arbor, USA
[2]Health and Society, Wageningen University and Research, Wageningen, Netherlands
[3]Health Services Research, Maastricht University, Maastricht, Netherlands
[4]European Observatory on Health Systems and Policies, Brussels, Belgium
Contact: michfalk@umich.edu

Background:
Do political parties matter to health? Do they affect population health either directly, or through welfare states' social policies and the eligibility, affordability and quality of health systems? And if they do, how? These are crucial questions if we are to understand health politics or shape public health policy, particularly given the changing landscape of both political parties, party dominance in the executive, and the possibly mediating influence of the legislature.

Methods:
This review using a systematic approach examines 107 peer-reviewed articles and books published after 1978 about high-income countries asking the overarching question: Do political parties matter to health and the welfare state?

Results:
As the literature relating parties to health directly was surprisingly thin, the welfare state was used as a 'proxy' variable. An overwhelming majority of the literature sample suggests that Left parties are inclined to expand the welfare state and avoid cutting benefits if possible, while the Right does not expand and tends to reduce benefits. There is an inflection in the 1980s when Left parties shift from expansion to maintaining the status quo.

Conclusions:
Considering current health trends in the form of measles outbreaks, the ''Deaths of Despair'', the return of presumed eradicated infectious diseases and the declining health expectancy rates in some Western countries as well as the rise of PRR parties in office we question the current partisanship thesis that political parties matter less and less.

Populist radical right parties, welfare policy and population health in Europe

Chiara Rinaldi

C Rinaldi[1], *MPM Bekker*[1,2]
[1]Health and Society group, Wageningen University and Research, Wageningen, Netherlands
[2]Health Services Research, Maastricht University, Maastricht, Netherlands
Contact: chiara.rinaldi@wur.nl

Background:
The political system is an important influencing factor for population health but is often neglected in the public health literature. This scoping review uses insights from political science to explore the possible public health consequences of the rise of populist radical right (PRR) parties in Europe, with welfare state policy as a proxy. The aim is to generate hypotheses about the relationship between the PRR, political systems and public health.

Methods:
A literature search on PubMed, ScienceDirect and Google Scholar resulted in 110 original research articles addressing 1) the relationship between the political system and welfare state policy/population health outcomes or 2) the relationship between PRR parties and welfare state policy/population health outcomes in Europe.

Results:
The influence of political parties on population health seems to be mediated by welfare state policies. Early symptoms point towards possible negative effects of the PRR on public health, by taking a welfare chauvinist position. Despite limited literature, there are preliminary indications that the effect of PRR parties on health and welfare policy depends on vote-seeking or office-seeking strategies and may be mediated by the political system in which they act. Compromises with coalition partners, electoral institutions and the type of healthcare system can either restrain or exacerbate the effects of the PRR policy agenda. EU laws and regulations can to some extent restrict the nativist policy agenda of PRR parties.

Conclusions:
The relationship between the PRR and welfare state policy seems to be mediated by the political system, meaning that the public health consequences will differ by country. Considering the increased popularity of populist parties in Europe and the possibly harmful consequences for public health, there is a need for further research on the link between the PRR and public health.

10.F. Workshop: New born screening in neuro-muscular diseases

Organised by: AFM Telethon

In the field of incurable neuromuscular diseases, the access to therapeutics is becoming a reality for some of them and some trials are on the way for the others. More precisely, all recent studies show the more effectiveness of these innovative therapies if administered early or pre-symptomatic stage of these diseases. For example, infant spinal muscular atrophy (SMA) is the most advanced with AMM treatment, several others, including gene therapy, in clinical trials, and three trials of pre-symptomatic administration. This makes this new-born screening a major public health issue with a diagnosis using molecular biology tools.

In this context, the French Muscular Dystrophy Association (AFM-Telethons) and the French muscular disorders network (FILNEMUS) with others associations and partners want to be a force for proposals in this area.

Speakers:
Vincent Laugel
CHU Strasbourg
Christian Cottet Général
Director AFM Téléthon
Jean-François Malaterre
Vice Président AFM-téléthon
Brigitte Chabrol
AP-HM Marseille

10.G. Workshop: SCIROCCO: a tool for accelerating the adoption of integrated care

Organised by: SCIROCCO Exchange Project
Chair persons: Diane Whitehouse - Belgium, Cristina Adriana Alexandru - UK
Contact: Cristina.Alexandru@ed.ac.uk

Integrated care is seen as a solution for addressing Europe's changing demographics and dealing with the fragmented delivery of health and care services affecting numerous healthcare systems.

The SCIROCCO tool is an online participatory tool which helps to facilitate multi-stakeholder dialogues on progress towards integrated care. It does so by:

- Defining maturity to adopt integrated care in terms of the Maturity Model developed by the European Innovation Partnership on Active and Healthy Ageing (B3 Action Group on Integrated Care).
- Assessing the maturity of healthcare systems.
- Assessing the maturity requirements of good practices.
- Supporting twinning and coaching for ‘‘knowledge transfer’’ to facilitate the adoption of integrated care and exchange of good practices.

Knowledge transfer is seen as mutually beneficial for involved regions to access evidence and learn about integrated care. In SCIROCCO, there are two variants of twinning: the first has the aim of transferring a good practice to the healthcare system, while the second is about the improvement of a particular aspect of a healthcare system in order to improve integrated care maturity. Twinning is becoming ever more popular as an approach, and - in 2019/2020 - is being used in a number of European projects.

The SCIROCCO tool was evaluated both quantitatively and qualitatively. Validity and reliability were evaluated using quantitative analyses while usability and perceptions on impact were assessed using questionnaires and focus groups. It was used by more than 60 healthcare organisations in Europe and beyond during 2016-2018. Most recently, it was tested in twinning and coaching activities, which resulted in the development of local Action Plans outlining steps forward on integrated care for the receiving regions.

As part of the SCIROCCO Exchange project, an enhanced SCIROCCO tool is developed. This tool will improve existing knowledge transfer activities by allowing for the easy searching of assets on integrated care from a variety of sources, supporting improvement planning and checking evolution towards plans.

The objectives of this workshop are:

- Presenting the main functionalities of the SCIROCCO tool
- Outlining the results of its overall evaluation
- Discussing the experiences that 2 regions have had with using the SCIROCCO tool for knowledge transfer
- Presenting progress and next steps during SCIROCCO Exchange for an enhanced SCIROCCO tool
- Presenting plans for evaluating the enhanced SCIROCCO tool
- Gathering input from workshop participants on how the enhanced SCIROCCO tool could even better support knowledge transfer in different regions.

Key messages:

- The experience of regions and evaluation results demonstrate the benefits of the SCIROCCO tool for facilitating multi-stakeholder collaboration and learning towards improving integrated care.
- The progress and plans for the SCIROCCO Exchange tool, enhanced with the feedback and suggestions of workshop participants, offer promise for even better support for knowledge transfer.

Introduction to the SCIROCCO online participatory tool and its evaluation

Cristina Adriana Alexandru

C Alexandru[1], *T Alhambra-Borrás*[2], *D Whitehouse*[3]
[1]School of Informatics, University of Edinburgh, Edinburgh, UK
[2]Polibienestar, University of Valencia, Valencia, Spain
[3]European Health Telematics Association, Brussels, Belgium
Contact: Cristina.Alexandru@ed.ac.uk

This presentation will first introduce the SCIROCCO and SCIROCCO Exchange projects and the Maturity Model developed by the European Innovation Partnership on Active and Healthy Ageing. Then, a demonstration will be made of the three main functionalities of the SCIROCCO tool: assessing the maturity of healthcare systems, assessing the maturity needs of good practices, twinning and coaching with its two variants. For each piece of functionality, the methodology of using the tool will also be presented. Finally, the two main types of evaluation that were carried out for the SCIROCCO tool, and their results, will be described:

1. Testing the validity and reliability of the SCIROCCO tool. This involved testing the content validity of the B3-Maturity Model through a literature review and Delphi survey, testing structural validity and reliability using quantitative analyses, and testing convergent validity through comparison with another tool that assesses a related concept. Results showed that the content of the wide range of dimensions and measurement scales reflects integrated care maturity, all 12 dimensions contribute to assessing integrated care maturity, the tool has good internal consistency and there is some support for convergent validity.
2. Testing user experience with the SCIROCCO tool. This involved a qualitative approach using questionnaires and focus groups. The findings helped to improve the tool and learn about its potential future uses and wider implications.

Practical experience with SCIROCCO twinning and coaching- the perspective of a transferring region

Andrea Pavlickova

A Pavlickova[1]
[1]Technology Enabled Care and Digital Healthcare Innovation, Scottish Government, Edinburgh, UK
Contact: andreapavlickova@nhs.net

One of the SCIROCCO twinning and coaching activities was conducted between two healthcare systems: Scotland and The Basque Country. The objective of this presentation is to describe the experience of the transferring region, Scotland. In particular, it will outline the role and engagement of the voluntary sector in the provision of integrated care in Scotland, in terms of:

- Organisation, including the definition of the voluntary sector, its size and stakeholders;
- Engagement of the voluntary sector with integration of care
- Introduction to Carrgomm and its activities (04/09/2018 study visit organised in Scotland)
- Conclusions, lessons learned.

Practical experience with SCIROCCO twinning and coaching- the perspective of a receiving region

Jon Txarramendieta Suarez

J Txarramendieta Suarez[1]
[1]Kronikgune Institute for Health Services Research, Bilbao, Spain
Contact: jtxarramendieta@kronikgune.org

One of the SCIROCCO twinning and coaching activities was conducted between two healthcare systems: Scotland and The Basque Country. The objective of this presentation is to describe the experience of the receiving region, the Basque Country. In particular, it will outline the role and engagement of the voluntary sector in the provision of integrated care in the Basque Country, in terms of:

- Organisation, including the definition of the voluntary sector, its size and stakeholders;
- Engagement of the voluntary sector with integration of care
- Motivation for the knowledge transfer activity with Scotland
- Objectives of twinning, potential benefits of the knowledge transfer activity
- Feasibility and required adaptation for the transfer
- Priority actions, main learnings
- Conclusions, lessons learned

Steps forward for the SCIROCCO tool and its evaluation as part of SCIROCCO Exchange

Stuart Anderson

S Anderson[1], *C Alexandru*[1], *T Alhambra-Borrás*[2]
[1]School of Informatics, University of Edinburgh, Edinburgh, UK
[2]Polibienestar, University of Valencia, Valencia, Spain
Contact: soa@staffmail.ed.ac.uk

The ambition of the SCIROCCO Exchange project is to maximise the value and impact of the B3-Maturity Model and the SCIROCCO tool. To this aim, SCIROCCO Exchange will develop an enhanced tool including a Knowledge Management Hub. The first objective of this presentation will be describing the progress and plans towards this enhanced tool.

The SCIROCCO enhanced tool will support measures for scaling up integrated care, and an important part of it will involve building cross system community to facilitate transfer and scaling. Through its Knowledge Management Hub, the enhanced tool will include the capacity to integrate knowledge from highly relevant sources of information on integrated care practice and advice. To support and augment twinning and coaching activities, it will allow the searching for, combination of this knowledge and its adjustment to the maturity levels of health systems and the maturity requirements of good practices. The enhanced tool will also support the tracking of the evolution of the maturity of the health systems and the maturity requirements of good practices, which will allow the development of further functionality for improvement planning and monitoring.

The second objective of this presentation will be outlining progress and plans towards the evaluation of the enhanced SCIROCCO tool. This evaluation will focus on the assessment of the enhanced tool's personalised knowledge transfer and capacity-building support. It will provide feedback on the processes of knowledge transfer and capacity-building support, and help conclude on the key mechanisms supporting these processes. Moreover, this evaluation will feed into the development of Improvement Plans in the 9 SCIROCCO Exchange regions. The ultimate goal of this evaluation is to optimise the potential of the enhanced SCIROCCO tool as a key facilitator and integrator of knowledge transfer and capacity-building support for integrated care.

Discussion and dialogue on steps forward for the SCIROCCO tool

Diane Whitehouse

D Whitehouse[1]
[1]European Health Telematics Association, Brussels, Belgium
Contact: diane.whitehouse@ehtel.eu

The objective of this presentation is to inspire input from workshop participants about how the enhanced SCIROCCO tool could even better support knowledge transfer in different regions. Participants will be encouraged to reflect on what the tool can do for them, how they can help to shape its content, and to ask questions of their own. List of suggested questions:

- What do you think about the tool as it stands today?
- Can you see ways of using the tool in your region/ on your site?
- What do you think about the plans to expand the tool as part of the SCIROCCO Exchange project?
- Would you be willing to get involved in shaping and enhancing the tool?
- Would you be willing to get involved in expanding the tool's use further? Could you use the tool for any twinning and coaching?
- Do you have any suggestions for improving the functionality of the tool?
- What are your opinions about the proposed way of evaluating the enhanced SCIROCCO tool?
- Do you have any suggestions for improving the evaluation?
- How would you get more involved in SCIROCCO Exchange?

10.H. Workshop: Social Cost-Benefit Analyses in Public Health

Organised by: Netherlands National Institute for Public Health and the Environment
Chair persons: Ardine De Wit - Netherlands, Paul Van Gils - Netherlands
Contact: paul.van.gils@rivm.nl

Economic evaluation in health care has a long-standing tradition in Europe, especially in the United Kingdom and the Netherlands. The incorporation of economic evaluations in resource allocation decisions is increasingly becoming embedded in national guidelines.

In other fields, however, the social cost-benefit analysis (SCBA) framework has been used for a vast period of time, especially in fields such as logistics or transportation. A social cost-benefit analysis (SCBA) evaluates the favorable and adverse effects of policy actions and the associated opportunity costs of those actions. The favorable effects are defined as the benefits, and the opportunities foregone are defined as the economic costs. The SCBA provides an overview of all effects, risks and uncertainties of a policy, and the resulting advantages and disadvantages for society as a whole. By quantifying and monetary valuing these advantages and disadvantages as much as possible in Euros, the SCBA provides insight into the impact of the measure on social welfare, expressed as the balance of benefits (in Euros) minus the costs.

In 2013, Dutch guidelines were developed for the proper and standardized execution of SCBA of future policies in public health. Building on this increased awareness, in 2014, the National Institute for Public Health and the Environment (RIVM) published reports on SCBA for prevention and care. Since then, a few SCBA's have been published which evaluated various regulatory policies.

The aim of this session will be to elaborate on 1) the SCBA methodology and to provide a brief introduction to methodological aspects (no abstract provided); 2) a SCBA to evaluate the consequences of Cognitive Behavioral Therapy for alcohol and cannabis addiction; 3) a SCBA to evaluate the consequences of tobacco control policies; and 4) a SCBA to evaluate the consequences of three policies to limit alcohol use; and 5) a SCBA to evaluate the consequences of two interventions to prevent toxoplasmosis.

Key messages:

- SCBA is a fairly new method in health care to map the consequences of long-term policy measures.
- With the help of an SCBA it is possible to indicate who pays for and who benefits from an intervention.

The SCBA methodology and to provide a brief introduction to methodological aspects

Ardine De Wit

A de Wit[1]
[1]RIVM, Bilthoven, Netherlands
Contact: ardine.de.wit@rivm.nl

Introduction of the method of a Social Cost-Benefit Analysis based on the workshop abstract.

Social cost-benefit analysis of Cognitive Behavioral Therapy for alcohol and cannabis addiction

Eelco Over

EAB Over[1]*, PF van Gils*[1]*, AWM Suijkerbuijk*[1]*, J Lokkerbo*[2]*, GA de Wit*[1]
[1]RIVM, Bilthoven, Netherlands
[2]Trimbos Institute, Utrecht, Netherlands
Contact: eelco.over@rivm.nl

Background:

A considerable number of people with an alcohol or cannabis addiction currently do not receive addiction care. Some hundreds of thousands persons in the Netherlands suffer from alcohol dependency, while some tens of thousands adolescents suffer from cannabis addiction.

Methods:

A (hypothetically) enhanced uptake of CBT in specialized addiction care centers was modeled using the SCBA approach. Two SCBA's were performed: one with respect to alcohol addiction and the other regarding cannabis addiction among adolescents.

Results:

Per person treated with CGT, these benefits accumulate to about 12,000 euro (range 10.000 - 14.000 euro). These profits originate from improved health and less mortality, improved quality of life and higher productivity. A decrease in the number of persons with an alcohol addiction will also lead to lower costs for police and justice following from less criminal activities. Furthermore, CGT is effective as treatment for adolescents with cannabis addiction. Per person treated with CGT, societal benefits accumulate to about 11.000 euro (range 9.700 - 13.000 euro). Here, the net benefits arise from improved health, improved quality of life, reduced early school leaving and higher incomes for those clients who have successfully participated in CGT in addiction care.

Conclusions:

This study shows that society can benefit from an increase in people treated with CGT in specialized addiction care. Such an increase in number of people treated could for instance be realized by educational programs for professionals who come across people with dependency problems, such as general practitioners, professionals working in emergency care and youth care.

Social cost-benefit analysis of tobacco control policies in the Netherlands

Paul Van Gils

RJA de Kinderen[1], BFM Wijnen[1], SMAA Evers[1], M Hiligsmann[1], ATG Paulus[1], GA de Wit[2], PF van Gils[2], EAB Over[2], AWM Suijkerbuijk[2], F Smit[3]
[1]Maastricht University, Maastricht, Netherlands
[2]RIVM, Bilthoven, Netherlands
[3]Trimbos Institute, Utrecht, Netherlands
Contact: paul.van.gils@rivm.nl

Background:

In the Netherlands approximately 23% of the population of 15 years and older smokes. The main research questions were to identify what social costs- and benefits can be expected when various tobacco control policies would be implemented in The Netherlands, how do costs and benefits change over time, and which sectors in society could expect to incur costs and in which sectors accrue profits.

Methods:

A SCBA was conducted using a combination of the Chronic Disease Model developed by the National Institute for Public Health and the Environment (RIVM), the SimSmoke model and a specially designed excel model. Policies included both tax increases (i.e. increase of excise tax on tobacco of 5% or 10% each year) and a policy package as proposed by the World Health Organization (i.e. including mass media campaigns and mediabans).

Results:

When no new policy measures are implemented, the prevalence of smoking will decrease by 2.3 percentage points over the next 35 years. The policies reviewed in this report have the potential to decrease smoking prevalence by 14.2 percentage points (and in a 'smoking-free society scenario, by as much as 17.4 percentage points). Furthermore, the results show that the intervention costs for all scenarios are minimal, and that investing in health is beneficial as seen from both the public health and fiscal perspective.

Conclusions:

This study demonstrated that reducing the prevalence of smoking has beneficial effects for various stakeholders within the Dutch society: such as employers (e.g. increased productivity) and consumers (e.g. increase quality of life).

Social cost-benefit analysis of regulatory policies to reduce alcohol use in The Netherlands

Ardine De Wit

GA de Wit[1], PF van Gils[1], EAB Over[1], AWM Suijkerbuijk[1], J Lokkerbol[2], F Smit[2], WJ Spit[3], SMAA Evers[4], RJA de Kinderen[4]
[1]RIVM, Bilthoven, Netherlands
[2]Trimbos Institute, Utrecht, Netherlands
[3]Ecorys, Rotterdam, Netherlands
[4]Maastricht University, Maastricht, Netherlands
Contact: ardine.de.wit@rivm.nl

Background:

If all costs and all benefits of alcohol use are expressed in monetary terms, the net costs were 2,3 to 4,2 billion euro in 2013. Examples of the costs of alcohol are less productivity at work, costs of police and justice and traffic accidents.

Methods:

In this study three regulatory policies have been modelled using the Social Cost-Benefit Analysis (SCBA) approach. Regulatory policies aimed at curbing alcohol consumption were (1) an increase in excise taxes, (2) a reduction of the number of sales venues, and (3) a total mediaban for advertising alcohol.

Results:

In the long run, over a period of 50 years, an increase in excise taxes of 50% will result in societal benefits of 4.5 to 10.7 billion euro, an increase of excise taxes of 200% will result in societal benefits of 12.2 to 35.8 billion euro. The societal benefits of closure of 10% of sales venues are estimated at 1.8 to 4.3 billion euro after 50 years, and at 4.6 to 10.7 billion euro when 25% of sales venues would be closed. The societal benefits of a mediaban would amount to 3.5 to 7.8 billion euro after 50 years, but this estimate is surrounded by uncertainty.

Conclusions:

Regulatory policies aimed at reducing the amount of alcohol consumed, such as a further increase of excise taxes, a reduction of the number of sales venues and a total mediaban, will result in savings for society at large. However, costs and benefits are spread unequally over the different stakeholders.

A social cost-benefit analysis of two One Health interventions to prevent toxoplasmosis

Anita Suijkerbuijk

AWM Suijkerbuijk[1], EAB Over[1], M Opsteegh[1], H Deng[1], PF van Gils[1], AA Bonacic Marinovic[1], M Lambooij[1], JJ Polder[1], TL Feenstra[1], JWB van der Giessen[1], GA de Wit[1], MJ Mangen[1]
[1]RIVM, Bilthoven, Netherlands
Contact: anita.suijkerbuijk@rivm.nl

Background:

In the Netherlands, toxoplasmosis ranks third in disease burden among foodborne pathogens, with an estimated health loss of 1,900 Disability Adjusted Life Years and a cost-of-illness estimated at €44 million annually. We performed a Social Cost-Benefit Analysis (SCBA) to evaluate the net value of two potential interventions, freezing meat and improving biosecurity in pig farms, for the Dutch society.

Methods:

We assessed the costs and benefits of the two interventions and compared them with the current practice of education, especially during pregnancy. A 'minimum scenario' and a 'maximum scenario' was assumed, using input parameters with least benefits to society and input parameters with most benefits to society, respectively.

Results:

The freezing meat intervention was far more effective than the biosecurity intervention. Despite high freezing costs, freezing two meat products: steak tartare and mutton leg yielded net social benefits in both the minimum and maximum scenario, ranging from €10.6 million to €31 million for steak tartare and €0.6 million to €1.5 million for mutton leg. The biosecurity intervention would result in net costs in all scenarios ranging from €1 million to €2.5 millions.

Conclusions:

From a public health perspective (i.e. reducing the burden of toxoplasmosis) freezing steak tartare and leg of mutton is to be considered.

10.I. Workshop: Bridging disciplines, sectors and systems for interdisciplinary research on antimicrobial resistance

Organised by: University of Bielefeld
Chair persons: Kayvan Bozorgmehr - Germany
Contact: victoria.saint@uni-bielefeld.de

Antimicrobial resistance (AMR) is one of the biggest contemporary threats to global health, food security and development. AMR is associated with longer illness, higher mortality and higher health care costs, and threatens the success of many disease interventions including surgery, chemotherapy and the fight against HIV, TB and Malaria. The risks and impacts of AMR are truly universal and global, putting everyone at risk across demographic, socioeconomic and geographic boundaries.

AMR is a ''wicked'' problem driven by a range of complex, structural and interconnected factors, including in sectors related to human health, animal health, agriculture and the environment. Research on AMR is therefore needed not only from, but which bridges across, diverse disciplines including biomedicine, public health and the environmental, animal, social and political sciences. Despite calls for coordinated action on AMR, traditional siloes between sectors and disciplines, and from research to practice, remain difficult to bridge. Many efforts have strengthened communication and coordination but remain essentially focused on ''drugs and bugs'', stopping short of achieving the type of radical, integrative and trans-border (disciplinary, sectoral, national, etc) collaboration needed to explore and effectively tackle this complex challenge.

The goal of this workshop is to create a space for dedicated discussion between professionals from diverse disciplines, sectors and settings to explore the following questions:

- What key questions or challenges for understanding and tackling AMR (from a research, policy or practice perspective) need to be explored using an interdisciplinary research approach?
- What thematic intersections, tensions and synergies exist between different disciplines conducting research on or relevant to AMR? What different theoretical perspectives and methodological approaches can be brought together to answer such questions?
- How can we create bridges and strengthen solidarity between professionals in different disciplines, sectors and stakeholder groups to foster the type of systematic, inter-/trans-disciplinary research needed? How can we ensure the knowledge generated informs evidence-based policy and practice to effectively and equitably tackle AMR?
- What initiatives for inter-/trans-disciplinary research on AMR have been effective and what can be learned to inform future research?

Following a brief introduction of key concepts and objectives, two presentations will provide input from research on the macro-structural drivers of AMR, which demonstrate the importance and value of different disciplinary research on this topic. A third presentation will explore equity and gender considerations in tackling AMR. The subsequent discussion will examine the above questions by tapping into the expertise, experience and perspectives of the presenters and participants. The workshop will close with a summary of lessons learnt and directions for future research.

Key messages:

- New forms of inter- and trans-disciplinary, translational research are needed to understand the complex drivers and dynamics of antimicrobial resistance and how to address this major global threat.
- Meaningful exchange is needed to identify concrete ways to overcome the methodological, practical and other challenges to conducting systematic, inter-/trans-disciplinary research on AMR.

Using a cultural contexts of health approach to address the challenge of antibiotic resistance

Katie Ledingham

K Ledingham[1]
[1]Wellcome Centre for Cultures and Environments of Health, University of Exeter, Exeter, UK
Contact: K.A.Ledingham@exeter.ac.uk

This presentation will provide an overview of key findings from a 2019 policy brief published by the WHO Regional Office for Europe using a cultural contexts of health approach to address the global health challenge of antibiotic resistance (ABR; see publication http://www.euro.who.int/en/publications/abstracts/antibiotic-resistance-using-a-cultural-contexts-of-health-approach-to-address-a-global-health-challenge-2019). It will delineate what a cultural contexts of health approach is and why it matters for tackling the contemporary threat of ABR. It is now increasingly recognized that the systematic neglect of cultural factors is one of the biggest obstacles to achieving better health outcomes and better standards of living worldwide. Using a cultural contexts of health approach, the presentation will describe how the prescription and use of antibacterial medicines, the transmission of resistance, and the regulation and funding of research are influenced by cultural, social and commercial, as well as biological and technological factors. The presentation will demonstrate how culture can serve as an enabler of health and provides new possibilities for change.

Applying a One Health approach to inter- and trans-disciplinary research on antimicrobial resistance

Timo Falkenberg

T Falkenberg[1]
[1]Department of Ecology and Natural Resources Management, Center for Development Research, Bonn, Germany
Contact: falkenberg@uni-bonn.de

This presentation will focus on the value and process as well as the opportunities and challenges of applying a One Health approach to conduct inter- and trans-disciplinary research on antimicrobial resistance (AMR) based on experiences in the Forschungskolleg (graduate school) ''One Health and urban transformation'' (https://www.zef.de/onehealth.html), hosted at the Center for Development Research in Bonn. The One Health approach acknowledges that human health is inextricably intertwined with animal health and the environment and that solutions to health issues can only be achieved by close collaboration and integrated approaches of those three domains. In the complex context of AMR, One Health is often mentioned as one promising way forward for managing and mitigating the approaching health crisis due to its inherent holistic and interdisciplinary nature. The presentation will provide an overview of inter- and trans-disciplinary research around One Health and AMR from the Forschungskolleg thereby exploring enabling factors and obstacles encountered.

Exploring equity, social determinants of health and gender considerations for antimicrobial resistance

Victoria Saint

V Saint[1]
[1]Department of Population Medicine and Health Services Research, University of Bielefeld, Bielefeld, Germany
Contact: victoria.saint@uni-bielefeld.de

This presentation will focus on three aspects related to the equity, social determinants and gender considerations relevant to AMR. The presentation will begin with a general description of how structural forces and socioeconomic inequities can result in specific population groups in society having differential exposure and vulnerability to AMR as well as suffering differential social, economic and other consequences and impacts from the associated ill health. Secondly, will be an explanation of the how the application of conceptual frameworks and approaches on equity, social determinants and gender on can shed valuable light on the specific pathways and mechanisms through which these patterns arise, and how these factors may influence the effectiveness of any initiatives and interventions aimed at tackling aspects of this global health challenge. The presentation will conclude by providing an overview of the emerging results from a scoping review on the gender, equity and social determinants considerations for tackling AMR and promising directions for inter-/trans-disciplinary research on this theme.

10.K. Workshop: Terrorist attacks and aftercare

Organised by: EUPHA (PMH)
Chair persons: Jutta Lindert - EUPHA (PMH), Johan Bilsen - Belgium
Contact: johan.bilsen@vub.ac.be

In recent years several European countries have been confronted with terrorist attacks. Since the Oklahoma City Bombing in 1995, there has been a growing evidence of trauma-research showing that survivors and witnesses of such attacks not only are affected physically, often with serous injuries, but also often experience severe mental health problems, such as PTSD, depression, or anxiety, which can take months or years to fade away. Moreover, such impact not only affect directly involved, but also indirectly involved persons (e.g. relatives of victims) and even the broader population. Terrorism has become a public health issue, challenging researchers to profoundly study determinants of terrorism as well as the ways of how to organise and install adequate preparedness before and proper responses and effective healthcare for populations in need after an attack.

Until now, aftercare for people directly or indirectly affected by terrorist attacks and for the broader population gets rather little scientific attention. How did the health care services respond to such attacks? How should they respond and why? Were these services adequately prepared? Have survivors sought out help themselves? While there is an increasing body of knowledge on the association between a terrorist attack and PTSD, depression or other mental health problems, there is little known on the psychological aid that was given, and to whom this was given.

In this workshop, research findings on aftercare after terrorism will be presented and discussed. Four researchers from three different European countries confronted with terrorist attacks in recent years (France, Belgium and Norway) will present their findings. Dr. Cécile Vuillermoz will present data on the immediate and long-term aftercare for civilians following the attacks on Charlie Hebdo in January 2015 in France, while Dr. Stephanie Vandentorren will present data on the psychosocial aid provided to directly exposed, witnesses and relatives after these attacks. Drs. Roel Van Overmeire will focus on the psychosocial aid offered to rescue workers shortly after the attacks in Belgium, and the months and years after. Finally, Dr. Lise Eilin Stene will give a presentation on current problems of healthcare in Europe in reaching those inflicted by terrorism and other traumatic events, while pointing to solutions and challenges for the future.

Key messages:

- More research is necessary to find adequate ways of reaching vulnerable people in need of psychosocial aid after terrorist attacks.
- More scientific insight is needed in the mental health impact of and the proper psychosocial aid response after large-scale traumatic events, in the direct aftermath as well as in the long term.

Psychological follow-up and its perception in civilians involved in the January 2015 terrorist attack in Paris, France

Cécile Vuillermoz

C Vuillermoz[1], *Y Montreff*[2,3], *P Pirard*[3], *S Lesieur*[2], *P Chauvin*[2], *T Baubet*[4], *S Vandentorren*[2,3,5,2]

[3]Santé Publique France, French National Public Health Agency, Saint-Maurice, France
[4]CESP Inserm, Université Paris, Paris, France
[5]Santé Publique France, Cellule d'intervention en région Nouvelle-Aquitaine, Saint-Maurice, France
Contact: cecile.vuillermoz@inserm.fr

Background:

A terrorist attack occurred in Paris in January 2015 against the staffs of the Charlie Hebdo magazine and a kosher grocery. This study examined the psychological follow-up and the non-satisfaction of the people civilians involved in the terrorist attacks.

Methods:

The IMPACTS survey, an open cohort study of civilians involved in the terrorist attacks was conducted 6-10 (wave 1) and 18-22 months (wave 2) after the attacks. Psychologists interviewed in face-to-face 190 civilians in wave 1 and 123 of them participate to the wave 2. A questionnaire was used to collect data on socio-demographic characteristics, exposure level, social support, psychological support and perception, impact on work and social functioning, and mental health disorders.

Results:

In wave 1 (N = 190), 24% of participants had initiated a regular follow-up with a psychologist or a psychiatrist. Reasons of non-follow-up were: they had refused because they did not feel the need or they did not want to talk about it (60%), it was not suggested to them (30%), or they have already had a follow-up before (12%). In wave 2 (N = 123), 25% had a regular follow-up with a psychologist/psychiatrist since the events, 22.0% had had a follow-up but not anymore in wave 2, 15% did not have a follow-up in wave 1 but they had in wave 2 and 38.2% never had. Psychological aid from professionals for resilience has not been appropriate for 32% of the participants at 6 months and for 39% at 18 months. In both waves, non-satisfaction of follow-up was more frequent among witnesses than with those who were directly exposed.

Conclusions:

Six months after the January 2015 terrorist attacks in Paris, among the participants without psychological follow-up, it was not offered to nearly a third of participants. In order to enhance resilience, psychological aid should also be provided to those who have not been directly exposed.

Main message:

Psychological follow-up should be provided to all civilians in short and long-term.

Psychological support in short term after the January 2015 terrorist attack in Paris, France

Stéphanie Vandentorren

S Vandentorren[1,3], C Vuillermoz[4], Y Motreff[1,2], P Pirard[1], S Lesieur[3], T Baubet[5], P Chauvin[3]

[1]Centre National de la Recherche Scientifique, French National Public Health Agency, Saint-Maurice, France

[2]Santé Publique France, Cellule d'intervention en région Nouvelle-Aquitaine, Saint-Maurice, France

[3]Institut Pierre Louis d'Epidémiologie et de Santé Publique, Department of Social Epidemiology, Sorbonne Université, Paris, France

[4]Centre National de la Recherche Scientifique, Centre Maurice Halbwachs, Paris, France

[5]CESP Inserm, Université Paris, Paris, France

Contact: Stephanie.VANDENTORREN@santepubliquefrance.fr

Background:

A terrorist attack occurred in Paris in January 2015 against the staffs of the Charlie Hebdo magazine and a kosher grocery. This study examined psychological support given to the people directly exposed, witnesses and close relatives of those who were injured, hostages or died.

Methods:

The IMPACTS survey was an open cohort lead in 2 waves (6 and 18 months after the events). Psychologists interviewed in face-to-face 190 civilians in wave 1. A questionnaire was used to collect data on socio-demographic characteristics, exposure level, psychological and social support, impact on work and social functioning, and mental health disorders.

Results:

Among the 190 participants in wave 1, 24.3% did not receive psychological support neither in 48 hours, between 2 and 7 days, and after 1 week. Among those who had received support, they had a contact in average with 3 institutions or associations. Within the 48 hours, psychological support was mainly provided by Medico-psychological emergency unit (CUMP) (45.2%). Between 2 and 7 days, CUMP (42.6%) and a Parisian hospital in specialized care unit for trauma (44.6%) had mainly offered psychological support. One week after events, psychological support was mainly provided by consultation in specialized care unit for trauma (41.4%) or in ambulatory (27.6%). Lack of psychological support was more frequent among men, unemployed, and witnesses (versus those who were directly exposed).

Conclusions:

This study suggests offering psychological support to the whole population that have been potentially impacted, and also for those who had not been directly threatened. Long-term psychological follow-up of the most affected ones remains an objective to consolidate initial care.

Main message: Psychological follow-up should be provided not only to threatened people but also to the most vulnerable people (unemployed).

Psychosocial aid provided to and sought by rescue workers after the March 2016 terrorist attacks in Brussels, Belgium. A qualitative analysis

Roel Van Overmeire

R Van Overmeire[1], RL Van Keer[1], L Vesentini[1], S Six[1], J Bilsen[1]

[1]Mental Health and Wellbeing research group, Department of Public Health, Vrije Universiteit Brussel, Brussels, Belgium

Contact: Roel.Van.Overmeire@vub.be

Background:

During the terrorist attacks of 22/03/2016 in Brussels, Belgium, hundreds of rescue workers were present or came to the sites to give aid to the victims. However, until now, there is little research about these first responders' own need for aid and support immediately after their work or later, and about how they experienced that aid.

Methods:

Using half-structured interviews, we collected data from 31 first responders including 4 nurses, 5 soldiers, 7 firefighters, 11 airport police officers and 4 Red Cross volunteers. Interviews were transcribed, coded and analyzed by two researchers.

Results:

Generally, debriefings were organized at hoc, informal and at the day of the event. Sometimes, an additional group conversation was organized in the week or weeks later. Further initiative was left to the rescue workers themselves to find psychosocial aid, whether inside or outside their organization. Because of many contextual factors (macho culture, no sense of normality of reactions on traumatic experiences, (lack of) social support, stigma of psychosocial health, lack of understanding of those who did not experience it...) rescue workers (mostly police officers and soldiers) often did not find the necessary psychosocial aid. Some workers simply accepted that they have changed due to the attacks. Those who did search for psychological help, experience several problems: the type of help, the financial costs, a lack of recognition of the psychosocial problems, etc.

Conclusions:

Psychosocial aid of first responders is often too short-term, ad hoc, and poorly prepared and organized. Awareness of adverse changes in health or personality can come long after the debriefing sessions. Furthermore, the quality of the debriefings is not always up to standard.

Main message:

Psychosocial aid must not only be aimed at the short term, and must be better prepared and organized.

Research under Attack: A Framework for Prospective Cross-European Research in the Wake of Terrorism

Lise Eilin Stene

L Stene[1]

[1]Norwegian Centre for Violence and Traumatic Stress Studies, NKVTS, Oslo, Norway

Contact: l.e.stene@nkvts.no

This presentation will propose a framework for prospective cross-European research study that may provide unique knowledge about the health effects of terror attacks and the challenges they impose to the health services. Terror attacks devastatingly affect individuals and societies worldwide. Unfortunately, unmet needs are frequently reported by those impacted. How to design and implement efficient psychosocial care, and reach affected individuals and communities, is a challenge for researchers, clinicians and policy makers alike. There is an urgent need for coordinated efforts to develop scientifically based guidelines for psychosocial support and health services after terrorism, and thus strengthen our public health preparedness to such events. Examples will be given on how accurate register-based and administrative claims data on primary and secondary health service utilization before and after attacks can be linked with terror-exposed individuals' own reports of their perceived health, social support and other factors that are important to consider in the planning and implementation of post-attack healthcare. Cross-country comparisons may provide new insight about cultural, structural and organizational factors that may impede or promote coherent patient pathways in the wake of terror attacks. A long-term goal is to develop a sound research methodology that allows for international comparisons of healthcare delivery in the context of different types of trauma. During the presentation, methodological challenges in current trauma-focused studies and suggestions for strengthening future research concerning healthcare to trauma-exposed populations will be discussed.

10.L. Workshop: Real-world data: are we ready to take up the challenge?

Organised by: EUPHA (HTA), EUPHA (EPI)
Chair persons: Chiara de Waure - EUPHA (HTA), Stefania Boccia - Italy
Contact: chiara.dewaure@unipg.it

Evidence provided by traditional clinical research often fails to answer patients', physicians' and healthcare decision-makers' questions about real-world practice and outcomes; in fact, real-world effectiveness may considerably differ from efficacy assessed in clinical trial settings. The rise of interest in real-world data (RWD) - data routinely collected outside a controlled research environment - is driven by the increasing need for evidence in specific populations, such as comorbid or multi-treated people. RWD can also allow investigation of unanticipated, uncommon or long-term outcomes. In addition, RWD may represent the only source of information in some fields of special interest, e.g. rare diseases. Furthermore, current conditional reimbursement systems of drugs require dynamic evaluations of cost-effectiveness that have necessarily to take RWD into account. Indeed, RWD play a relevant role also in Health Technology Assessment (HTA) projects that should release the most up-to-date evidence and should be updated once new data are available. Nonetheless, common concerns about evidence derived from RWD include uncertainty about data quality, high possibility of bias, difficulties in managing a vast amount of data coming from different sources as well as legal and privacy requirements, in particular in the light of the new General Data Protection Regulation. However, HTA cannot exempt using RWD as it is entrusted to assess short- and long-term consequences of the application of health technologies, in terms of both health outcomes and costs. This workshop is an opportunity to discuss current and future challenges in the use of RWD in HTA and concerns preventing researchers from exploiting RWD full potential.

Key messages:

- Real-world evidence and randomized control trial data are considered mutually complementary in generating evidence and supporting decision-making.
- Real-world data have proved to be crucial as instrument to gather data in HTA and to support decision-making.

Call for a European collaboration in the use of Real World Data in Health Technology Assessment

Marco Marchetti

S Daugbjerg[1], *M Marchetti*[1]
[1]National Center for Health Technology Assessment, Italian National Institute for Health, Rome, Italy
Contact: marco.marchetti@iss.it

Issue/problem:

Modern patient care requires a heavy investment in innovative health technologies while at the same time it is facing a fiscal sustainability challenge in the health care system. Evidence on effectiveness of health technologies informing Health Technology Assessments (HTA) have traditionally been based on randomized control trials (RCTs). However, RCTs are expensive and the external validity is relatively low which makes it difficult to assess effectiveness and long-term outcomes in clinical practice especially in diverse populations.

Description of the problem:

Real-World Data (RWD) studies use observational data routinely collected to gather information on the delivery and outcome of care. RWD studies cost less than RCTs and are considered to have a high external validity. Results from RWD studies are therefore a good supplement to support evidence from RCT in HTA-reports. However, RWD are not still fully used in HTA. This is partially due to concerns about data quality and accessibility.

Effects/changes:

In order to provide a deeper insight into how health technologies are working in real-world settings across Europe, it is time to systematically including RWD in HTA. A first step should be to call for a European collaboration to map relevant sources of RWD that can be used in HTA and define the quality and main format, in which they can be analysed and used. Common legislations and guidelines regarding which RWD should be accepted as sources of information for HTA should be elaborated.

Lessons:

Through a European collaboration, the quality and accessibility of RWD should be secured in order to use evidence from RWD studies to inform HTA on effectiveness of health technologies.

Can we rely on non-randomised studies? Findings from a meta-epidemiological review

Maximilian Salcher-Konrad

JC Rejon-Parrilla[1], *M Salcher-Konrad*[2], *M Nguyen*[2], *K Davis*[2], *P Jonsson*[1], *H Naci*[3]
[1]National Institute for Health and Care Excellence, Manchester, UK
[2]LSE Health, London School of Economics and Political Science, London, UK
[3]Department of Health Policy, London School of Economics and Political Science, London, UK
Contact: M.Salcher@lse.ac.uk

Background:

Increasingly, health technology assessment (HTA) agencies must decide whether new medicines should be used routinely in the absence of randomised controlled trial (RCT) data, relying solely on non-randomised studies (NRS), which are at high risk of bias due to confounding. Against the background of increased availability and improved methods to analyse non-randomised data (e.g., propensity score methods and instrumental variables), it is important for decision-makers to have guidance on the analysis and interpretation of NRS to inform health economic evaluation. We therefore aimed to systematically and empirically assess the performance of NRS using different analytical methods as compared to RCTs and develop recommendations on the basis of our findings.

Methods:

We conducted a large-scale meta-epidemiological review to obtain estimates of the discrepancy in treatment effects in matched RCTs and NRS of pharmacologic interventions from published meta-analyses indexed in MEDLINE and the Cochrane Database of Systematic Reviews. We also consulted with HTA bodies, regulators and academics from five European countries to learn from their experience with using non-randomised evidence.

Results:

We compiled the largest dataset of clinical topics with matching RCTs and NRS using various analytical methods to date, covering >100 unique clinical questions. Incorporating information on direction of effect and effect size from >700 unique studies, the dataset can be used to evaluate discrepancies in treatment effects between study designs across a wide range of therapeutic areas.

Conclusions:

An empirically based understanding of the risk of bias in NRS is required in order to promote the adequate use of non-randomised evidence as input for health economic decision-making.

Governance of collection, use and storage of RWD in the view of data protection concerns

Mahsa Shabani

M Shabani[1]
[1]Center for Biomedical Ethics and Law, University of Leuven, Leuven, Belgium
Contact: mahsa.shabani@kuleuven.be

Issue/problem:

Collection, storage and sharing RWD raise concerns regarding the privacy, data protection and governance of access. To date, the concerns related to consent and adequate safeguards for data protection in conventional research and health care settings are being discussed in details in the literature. However, collection of RWD from individuals fuels questions regarding the applicability of the regulations for human subjects' research and personal data protection.

Description of the problem:

The data collected in the framework of RWD need to be protected in line with the overarching principles of human subjects research and personal data protection regulations such as the EU General Data Protection Regulations (GDPR). In particular, the purposes of data collection, potential further uses, duration of storage of data and the authorized users' access to data should be managed in compliance with applicable data protection regulations. In addition, the adequate models for de-identifications of data should be used in compliance with the applicable data protection regulations. Ethical oversight on the process of data collection, storage and use should also be scrutinized.

Effects/changes:

In order to respect the privacy rights of the patients, it is essential to first identify the potential risks and assess the adequacy of the existing safeguards in protecting the privacy of the patients.

Lessons:

The effectiveness of the current access governance in the context of RWD should be assessed and the required safeguards to be proposed.

10.M. Workshop: Behaviour change and knowledge translation: The unlocked potential to improve people's health

Organised by: EUPHA (CHR), WHO EURO, IBTN
Chair persons: Iveta Nagyova - EUPHA (CHR), Simon Bacon - Canada
Contact: iveta.nagyova@upjs.sk

Background:

Despite the complexities of modern healthcare it remains the case that human behaviour plays a critical role in health outcomes and in the efficacy of most treatments. We know that people get sick because of unhealthy behaviours. We know that the success of most healthcare interventions is highly dependent on patients' willingness to adhere to self-care activities such as taking medications or performing self-examinations. Over the last decades well-validated, cost-effective behavioural medicine interventions have been developed. The field has contributed to strategies in health education, with techniques for modifying behaviour, and enhancing motivation and learning for health. More recently, multilevel intervention models, including environmental and policy variables, are being increasingly proposed and tested. Yet, for several reasons, only few such interventions have been translated into policy recommendations or implemented successfully in clinical practice. Through highlighting critical gaps in knowledge translation that can be addressed by integrating modern theoretical and methodological approaches across disciplines we hope to contribute to the development of effective and implementable behaviour change interventions for optimal population and individual health and well-being.

Aim:

The aim of this workshop is to broaden our understanding of measures that have originated from behavioural sciences and have a lot to offer to public health. This workshop also seeks to contribute to capacity building in knowledge translation and evidence-informed decision-making in public health.

Workshop structure:

The workshop will consist of five presentations providing an overview of topical issues in the field of behaviour change and knowledge translation, followed by an interactive audience discussion. The first presentations will introduce the most recent challenges in knowledge translation from the WHO/Europe perspective. The second presentation will discuss the possibilities of using behaviour change principles in the development and adoption of health policies showcasing the Canada's newly adopted Food Guide. The third presentation will highlight the challenges in tackling physician's ability to effectively conduct behaviour change counselling with their patients in the context of chronic disease prevention. The fourth presentation will make the link between the knowledge translation theory and practice, using the Behaviour Change Wheel theory. The fifth presentation will introduce the free academic meta-search engine - Motrial, which has a great potential in evaluating the randomized controlled trials and fuelling meta-analyses and systematic reviews in return of better quality. Further to the reflexion on the current knowledge base, an audience discussion will give attendees the opportunity to share their opinions regarding challenges and opportunities in knowledge translation to improve people's health and well-being.

Key messages:

- Policy development and adoption can be considered as a behaviour change process.
- The application of behaviour change principles to the policy process may lead to greater stakeholder engagement and faster policy implementation.

EVIPNet Europe – bridging the research-to-policy gap

Tanja Kuchenmueller

T Kuchenmueller[1], *A Suvanbekov*[1]
[1]Division of Information, Evidence, Research and Innovation, WHO EURO, Copenhagen, Denmark
Contact: kuchenmullert@who.int

Issue/problem :

Despite substantial investments into increasing the availability and accessibility of information in the WHO European Region, scientific evidence often plays a limited role in policy and practice resulting in lost opportunities to improving health systems and outcomes.

Description of the problem:

The WHO Action plan and resolution to strengthen the use of evidence, information and research for policy-making, adopted in 2016, urges Member States to increase country capacity to foster the utilization of research in both policy and practice. To support and guide Member States in this effort, the World Health Organization (WHO) Regional Office for Europe launched the Evidence-informed Policy Network (EVIPNet) Europe, a capacity-building initiative that operates in line with, and in support of, Health 2020 and the 2030 Agenda for Sustainable Development. EVIPNet Europe aims to assist its member countries and catalyse sustainable change by strengthening both the evidence supply and demand sides, and building knowledge translation (KT) capacity at individual, organizational and system levels.

Results:

EVIPNet Europe has been successful in enhancing the capacity of policy-makers and researchers to access, appraise, package and use evidence; strengthening organizational capacity and infrastructure; and creating institutional bridges between policy and research communities. The network's activities have, furthermore, led to an increased conceptual and instrumental use of evidence in policy, introducing important changes in policy strategy development and legislations.

Lessons:

To overcome the knowledge-to-policy gap, comprehensive capacity building strategies, operating at individual, organizational and systemic levels are required to create and sustain a culture more favourable to evidence-informed policy.

Using behaviour change principles in the development and adoption of health policies

Simon Bacon

S Bacon[1,2,2]
[1]Department of Health, Kinesiology, and Applied Physiology, Concordia University, Montreal, Canada
[2]International Behavioural Trials Network, Montreal, Canada
Contact: simon.bacon@concordia.ca

Issue/problem:

We now live in world of ever-increasing amounts of evidence and information. Unfortunately, high quality evidence is not always incorporated into policy documents and can be ignored by policy makers when making decisions.

Description of the problem:

Canada recently released its Healthy Eating Strategy, a comprehensive policy which covers a number of aspects, including Canada's new Food Guide. The Food Guide is rooted in both nutritional and behavioural evidence. It is unique in the fact that it has taken a behaviour-oriented perspective, rather than a macro and micronutrient path. In addition, to incorporating a behavioural perspective into the policy there is a concerted effort to leverage basic behaviour change principles to get the healthcare community to increase their uptake and usage of the food guide. Furthermore, the same principles are being leveraged to ensure that policy makers and members of the government continually reinvest and push the food guide forward as new evidence is generated.

Results:

Though the Healthy Eating Strategy is still relatively new, there has been substantial policy movement on a number of the areas it will tackle. For the Food Guide, this was only released at the start of 2019, so its uptake and impact is not currently measurable. However, there is a monitoring plan which will evaluate these aspects. That being said, there is some evidence that the Food Guide, and the messaging around it, has been well received.

Lessons:

Taking a behaviour change perspective in the development and delivery of policy, especially health policy, has the potential to positively engage more stakeholders in the process. Ultimately, more evidence is needed to define the optimal way to do this.

Applying behavioural science to improve physicians' ability to help people improve their own health behaviours

Kim Lavoie

K Lavoie[1]
[1]Department of Psychology, UQAM, Montreal, Canada
[2]International Behavioural Trials Network, Montreal, Canada
Contact: kiml_lavoie@yahoo.ca

Issue/problem:

Poor health behaviours are at the centre of most non-communicable chronic diseases and account for a significant amount of morbidity and mortality. Healthcare professionals, and especially physicians, are in a unique position to be able to positively influence their patients and aid them in changing poor health behaviours. However, most physicians report having low confidence or a lack of skills to effectively achieve this.

Description of the problem:

The main approach that physicians take to influence their patients' poor health behaviours is to provide them with advice and evidence about the impact of the poor health behaviours. This strategy has been shown to have limited impact on changing patient behaviour. As such, there is a need to develop effective interventions that target changing physician health behaviour counselling behaviours, effectively, a behaviour change intervention for physicians so that they are better at helping patients change their behaviour.

Results:

Using a structured stakeholder-oriented approach (the ORBIT model for developing behavioural interventions) we have systematically developed a robust behaviour change-based continuing medical education curriculum (leveraging motivational communication), and online assessment tool to improve physician competency. These were developed by a pan-Canadian team with notable international input through the IBTN.

Lessons:

The use of a structured stakeholder-driven process, we have developed an intervention which seems to have greater relevancy to the target audience, lead to greater engagement, and a higher probability of implementation than a researcher led approach. Whilst the studies are still ongoing, it is anticipated that this intervention will be able to dramatically improve the health of individuals through effective health behaviour change interventions by healthcare professionals.

Mobilizing knowledge in behaviour change to promote health; the case of the Behaviour Change Wheel

Ariane Belanger-Gravel

A Belanger-Gravel[1]
[1]Department of Information and Communication, Laval University, Québec, Canada
Contact: ariane.belanger-gravel@com.ulaval.ca

Issue/problem:

Over the past decades, researchers from many fields have built an impressive body of knowledge regarding behaviour change. However, the use of this knowledge for accurately designing/delivering/executing behaviour change programs is challenging for many public health practitioners.

Description of the problem:

To support effective knowledge mobilization in behaviour change and to build a coherent and useful body of scientific evidence, leading researchers in behavioural sciences have developed and refined a number of tools for designing interventions. Among these tools, the Behaviour Change Wheel (BCW) was built on an impressive effort to synthetize available evidence regarding intervention development frameworks, behaviour change theories, and behaviour change techniques. However, studies highlighted some issues associated with the use of these methodological innovations. Working with our public health partners in the field of health communication, we realized that applying models such as the BCW is far from being mundane practices. To support optimal knowledge mobilization in behavioural sciences, we are developing a research agenda to understand perceptions and motivations of public health practitioners toward innovations such as the BCW and to develop and evaluate knowledge mobilization strategies.

Results:

The initiative will contribute to the development of new scientific knowledge regarding mechanisms underlying effective knowledge mobilization in behaviour change and will further support the adoption of these evidence-based practices within the field of public health.

Lessons:

Although rapidly adopted by the community of researchers, it is not clear whether or not public health practitioners would be as willing, or capable of using the BCW to design and deliver programs. Issues regarding knowledge mobilization in behaviour change should be addressed to improve the uptake of this knowledge in practice.

Motrial - An Academic and Collaborative Search Engine Dedicated to Behavioural and/or Public Health Intervention Publications

Gregory Ninot

G Ninot[1]
[1]Plateforme CEPS, University of Montpellier, Montpellier, France
Contact: gregory.ninot@umontpellier.fr

Issue/problem:

Trials are the most reliable source of evidence on the efficacy, safety and cost-effectiveness of interventions aimed at preventing, caring or curing. Their number in the field of non-pharmacological interventions (NPIs), especially behavioural interventions, has increased exponentially since 2000. Their methodology is improving with the support of several organisations such as CONSORT, SPIRIT, TIDieR, PRISMA and IBTN. They can fuel meta-analyses and systematic reviews in return of better quality.

Description of the problem:

One of the difficulties in carrying out these meta-syntheses is the exhaustive and relevant search of trials. Publications are not always identified in biomedical databases (e.g., PubMed, Embase). New article publishing offers are available to authors such as Open Access journals (e.g., PLOS One, Scientific Reports, Helyion, JAMA Network Open). Data collection of trials is more difficult, longer and subject to biases.

Results:

The Plateforme CEPS, which has the general objective of encouraging clinical trials on NPIs, has created a search engine that makes it easier to find these trials. Motrial (www.motrial.fr) distinguishes the main publication from secondary publications and duplicates. It indicates whether the trial has been declared to an ethics committee, registered to the competent authorities and received funding. This academic search engine in English is free. The search can be configured with methodological and ontological criteria. If not already done, the user is invited to join the main publication of the trial with the declaration of its protocol to an official instance. Motrial displays the main characteristics of the trial and its main publication. Each request can be saved, modified, completed.

Lessons:

Data collection of non-pharmacological intervention trials is difficult, long, and subject to biases. The free and academic meta-search engine Motrial is a tool that helps to advance knowledge utilisation.

10.N. Workshop: Leveraging evidence for policy making: lessons from the European Joint Action on Health Information

Organised by: InfAct, Sciensano, Belgian Federal Public Health Institute
Chair persons: Claudia Habl - Austria, Herman Van Oyen - Belgium
Contact: marie.delnord@sciensano.be

Leveraging evidence to inform best practices in health policy and health care is pivotal for better health outcomes. This has been widely recognized by international organizations such as the World Health Organization, and national health authorities. Health information (data on health and health systems) can be used to inform interventions at national, regional and local level. However, getting evidence into the hands of key stakeholders is still a challenge in many European countries. There are many obstacles, for instance interoperability between data systems is an issue, and the resources allocated for health reporting and monitoring are sometimes insufficient.

There is an uneven evolution of data collection practices across Europe which may imply differences in the capacity to use evidence for policy development. While public health agencies aim to improve health for all, building bridges for better knowledge translation requires tools to pave the way forward. As the nature and volume of data that are generated increases, countries increasingly need frameworks with which to appraise, and apply evidence. This relies on the innovative use of health information in public health and the health policy process, and increased solidarity in data sharing among actors in the health system.

This workshop aims to provide delegates with a clear understanding of the strategies that can support the use of evidence in the European context. Five case examples from the European Joint Action on Health information (InfAct) will be presented. The panelists will provide solutions that support the transfer of knowledge from scientific research, and public health surveillance into policies and innovative programmes.

The objectives are two-fold: 1) to provide delegates with an overview of the accessibility of health information for public health policy in EU-Member States; 2) to present solutions that focus on better data sharing, and new roles for stakeholders working in health and policy.

The workshop will begin with an introduction to the latest developments in health data collection, quality assessment, and on the availability of health information in Europe. Next, strategies to prioritize health information for policy development will be presented. Across countries, there is increasing interest on how to use ‘‘real world data’’ which requires an understanding of the interoperability frameworks available in Europe - this will be the focus of the third and fourth presentations. Finally, a new tool for evaluating the impact of health information developed with input from European experts in 38 countries will be introduced.

The session will have an outcomes-oriented approach. We will build on the opportunity for interactive exchange with the delegates. Dialogue on what can be done, and what is needed to leverage data for action will be transcribed. This will inform a commentary that can later be submitted to the European Journal of Public Health.

Key messages:

- There are wide differences across Europe in the development of information systems and data reuse. It is crucial to facilitate the use of evidence for policy development and decision-making.
- The EU-Joint Action InfAct is promoting evidence-informed policy-making by structuring health information exchanges in Europe, and providing tools for a sustainable impact in policy and practice.

Generating knowledge on data collection methods and the availability of health information in Europe

Brigid Unim

B Unim[1], *E Mattei*[1], *F Carle*[2], *E Bernal-Delgado*[3], *P Achterberg*[4], *H Tolonen*[5], *M Zaletel*[6], *T Grisetti*[1], *H Van Oyen*[7], *L Palmieri*[1]
[1]Department of Cardiovascular, Endocrine-metabolic Diseases and Aging, National Institute of Health, Rome, Italy

[2]Center for Epidemiology, Biostatistics and Medical Information, Marche Polytechnic University, Ancona, Italy
[3]Health Services and Policy Research Group, Institute for Health Sciences IACS, Zaragoza, Spain
[4]Centre for Health Knowledge Integration, RIVM, Bilthoven, Netherlands
[5]Department of Public Health Solutions, National Institute for Health and Welfare, Helsinki, Finland
[6]Health Data Centre, National Institute of Public Health, Ljubljana, Slovenia
[7]Epidemiology and Public Health, Sciensano, Brussels, Belgium
Contact: Brigid.Unim@iss.it

Background:

Data collection methods, metadata-reporting standards and usage of data for health monitoring (HM) and health system performance assessment (HSPA) are not uniform in Europe. Moreover, the evidence produced by research are not always available, comparable or usable for research purposes and policy making. The aim is to summarize health data collection methods, quality assessment, availability and accessibility procedures covering different data sources for HM and HSPA across EU countries.

Methods:

The study is conducted through a multidimensional approach, which includes: i) a review of institutional websites (OECD, Eurostat, WHO-Europe); ii) a review of EU research networks; and iii) a multi-national survey addressing epidemiologists, health data managers and researchers that have played leading roles in EU projects. Currently, the survey instrument is being piloted. A qualitative data analysis to describe and compare the identified data sources for HM and HSPA will be performed.

Results:

As part of the work within the Joint Action 'Information for Action' (InfAct), the study will generate knowledge on standardized health data collections and related metadata, used methods and procedures for HM and HSPA in EU. It will also facilitate the identification of national or sub-national health data collected through standardized procedures but not included in international databases or research networks.

Conclusions:

The lack of infrastructures for health data sharing in EU limits data usage and comparability within and between countries. This study, as part of InfAct, will facilitate the assessment of health inequalities across EU countries in terms of quality, availability, accessibility and comparability of health data and information. It will also facilitate sharing and dissemination of standardized and comparable health data collections, which are essential for research and evidence-based policy-making.

The innovative use of health information in public health policy across EU-Member States

Romana Haneef

R Haneef[1], H Van Oyen[2], R Gaidelyte[3], O Zeynep[4], B Pérez-Gomez[5], H Haaheim[6], L Palmieri[7], S Mathis-Edenhofer[8], O Majek[9], A Gallay[1]

[7]Department of Cardiovascular, Endocrine-metabolic Diseases and Aging, National Institute of Health, Rome, Italy
[8]Federal Ministry of Labour, Social Affairs, Health and Consumer Protection, Vienna, Austria
[9]Institute of Health Information and Statistics, Prague, Czech Republic
Contact: romana.haneef@santepubliquefrance.fr

Background:

Health information systems both at the national and international level play a key role in ensuring that timely and reliable evidence is used for operational and strategic decision making inside and outside the health sector. The availability of data generated from different sources is increasing with the possibility to link these data sources together. However, more efficient data generation processes are required to use data collected for different purposes initially, as well as advanced statistical techniques to generate comparable and timely health information. The main objective is to explore the innovative use of health information for better public health policy across the Member States.

Methods:

As part of InfAct, we have conducted as survey among EU-MS to describe the innovative use of data sources. We are collecting inspiring examples on the innovative use of health information based on national or European data networks involved with health policy-making at national, regional or local level. We are further developing generic methods to estimate health indicators using machine learning techniques and mathematical modelling.

Results:

These approaches will generate a roadmap on the innovative use of health information across Member States, enlarge the existing list of health indicators estimated from linked data and/or advanced statistical techniques, inform on the implications of these indicators in health policy with inspiring examples from Member States, and provide methodological guidelines for using linked data and advanced statistics to estimate health indicators, and composite outcome measures.

Conclusions:

This work will highlight the gaps in the innovative use of data sources, and improve the comparability of health indicators and the capacity of EU-Member states to apply innovation for increased relevance and timeliness of health information for public health policy-making.

Prioritizing Health Information in Europe – What do we want and need to know?

Katherine J. Ombrellaro

Background:

Prioritization of Health information (HI) involves the establishment of methodological standards, and the development of political momentum to reliably track health status and health determinants. This is important in order to strengthen the evidence base for public health policies and facilitate effective delivery of healthcare services. In support of the establishment of a sustainable EU-wide Health information system, this consortium explores how HI is prioritized in EU and associated countries.

Methods:

The Robert Koch Institute is conducting an online Policy Delphi survey among InfAct project partners, stakeholders from EU-Member States and associated countries. The Delphi methodology allows for rankings and priority-setting among a group of experts. The Policy Delphi facilitates the analysis of the impact and acceptability of a proposed policy option. The survey targets experts in national public health institutes and agencies, ministries of health and research. Participants are invited to provide information regarding their national HI prioritization processes, and to rank prioritization strategies and criteria, according to their degree of "desirability", "feasibility", "importance" and "confidence".

Results:

The Delphi survey will compile and assess processes and methods used to prioritize health information at national level in the EU and associated countries. The expected outcome is a list of good-practices in health information development and prioritization within countries, which could be further integrated to a health information prioritization strategy at the European level.

Conclusions:

Prioritizing health information ensures that the right data is collected, is used to support ongoing public health policy action, and to capture emerging public health issues. This overview of prioritization strategies and methods aims to promote evidence-based public health by structuring exchanges about national HI prioritization in Europe.

Real world evidence for European health policy-making: making the case for interoperability

Enrique Bernal-Delgado

Background:

The foundations of evidence-based health policy-making are transitioning from the use of partial evidence yielded elsewhere and the application of heuristic rules, to the development of learning systems based on the reuse of routine data collected by the same institutions that have to implement those policies. Supporting that transition, the scientific production of real-world evidence (RWE) is becoming pivotal, particularly in international policy-making. However, leveraging the immense wealth of data curated in European public institutions, requires the development of a new world-class research infrastructure and a supporting interoperability framework (IOF).

Methods:

Based on the European Interoperability Framework (EIF) legal, organizational, semantic, and technical issues are being assessed. While legal, organizational and technical topics are analyzed from the perspective of the type of infrastructure, centralized or federated, to be developed, semantic interoperability is explored using three case studies on the linkage of different real world data sources: for characterizing resilient populations, studying the burden of dementia, and the effectiveness of stroke care pathways.

Results:

Preliminary assessments advocate for the development of a federated infrastructure where data remain in house and research questions, data access and interoperability services are shared according to the capacity of each specific partner in the federation. Interoperability services for such an infrastructure should cover: a) the development and maintenance of a common data model to assure semantic interoperability, b) the development of self-contained distributed analytical pipelines; and c) the implementation of a training program aimed at increasing the capacity of each RI hub.

Conclusions:

An interoperable federated research infrastructure is required to leverage the potential of real world data for European health policy-making. InfAct is paving the way.

The Health-Information Impact Index: a tool to monitor the uptake of evidence in policy and practice

Contact: marie.delnord@sciensano.be

Background:

The optimal use of data and evidence from national health information systems is paramount in public health. However, current tools to evaluate health information systems focus on data quality and availability rather than measuring how data are used by key stakeholders. This limits capacity to monitor the impact of evidence on health care management and health policy making.

Methods:

Based on an extensive literature review we developed a new model, the Health Information (HI)-Impact framework, to monitor the impact of health information in health policy and practice. We further conducted a web-based Delphi survey between February and April 2019 among European public health professionals working in health policy, health care, research, and health monitoring to develop the HI-Impact Index.

Results:

In the HI-Impact framework, four domains are essential for mapping public health data availability, dissemination, and use: (1) Health Information and Evidence Quality, (2) Health Information System Responsiveness, (3) Stakeholder Engagement, and (4) Knowledge Integration. This last domain has a broader reach on the determinants of health and reflects the use of evidence by community partners and across sectors. In the DELPHI survey, 127 experts from 38 European countries selected 30 criteria to integrate in the HI-Impact Index. This tool could be used by European public health agencies to monitor the impact of their information products, and inform national strategies for evidence-based public health.

Conclusions:

It is crucial for routine health information systems to create a culture of accountability in the use of evidence. Data on the determinants and consequences of ill-health as well as stakeholder engagement in leveraging evidence for intervention are explicit points to consider for a full quality assessment of national health information systems, and a sustainable impact on health outcomes.

10.O. Knowledge transfer strategies for more evidence-based practices: West Africa and France examples

Organised by: ISPED - Institut de Santé Publique d'Epidémiologie et de Développement
Chair persons: Linda Cambon - France, Valéry Ridde - France
Contact: aurelie.affret@u-bordeaux.fr

Evidence-based decision-making and practice are pivotal in public health. They offer a way to improve the efficiency, credibility, and sustainability of health systems. For researchers, this means looking ahead to the dissemination of findings and integrating different types of knowledge and decision-making challenges. It also implies greater collaboration between the research community and decision-makers. Furthermore, this can lead to a better social acceptance of the chosen decisions and interven-tions. However, despite the general agreement about the interest of evidence informed practices and policy-making, barriers do persist in both the production and use of evidence. These barriers relate to people, organisations, contexts and properties of evidences. To address this, it is necessary to rethink how knowledge is produced and used, to enhance our understanding of decision-making processes, logics and mechanisms and to examine the ability of public health services to integrate research findings into their decisions and operations. This requires a systemic approach, which includes the adaptation of scientific knowledge, the ability of users to capture, understand and apply the available evidence, as well as an accurate organisation and a supportive culture for using evidence. These are the major chal-lenges of knowledge transfer, defined by the National Public Health Institute of Quebec (INSPQ) as ‘‘the group of activities and interaction mechanisms that foster the dissemination, adoption and appropriation of the most up-to-date knowledge possible for use in professional practice and in healthcare manage-ment’’. In light with that context, the objective of this workshop is to share the most recent research re-lated to knowledge transfer that involve decision makers and field professionals, and to discuss with them of its impact on their practice. Use of knowledge transfer being extremely context dependent, the workshop will provide two examples of research under process in France and Francophone West Africa (that involve decision-makers and field professionals) that aim to improve evidence-based decision-making and practice in local prevention sector. KT research is still relatively rare in the French-speaking countries and this workshop aims in particular to provide a crossover perspective in a context of high- and low-income countries. These researches will be discussed from the point of view of decision-makers and field professionals. The workshop will also offer the opportunity to highlight several methodologies used in knowledge transfer research and several knowledge transfer strategies and tools as well as their relation to context.

Key messages:

- This workshop is the opportunity to share the most recent research related to KT that involve decision makers and field professionals, and to discuss with them of its impact on their practice.
- Knowledge transfer strategies are known to be context dependent.

Evaluation of a KT scheme to improve policy making and practices in health promotion, TC-REG project

Aurelie Affret

A Affret[1,2], *O Aromatario*[3], *L Cambon*[1,2]

Contact: aurelie.affret@u-bordeaux.fr

Background:

Evidence-based decision-making and practice are pivotal in public health but barriers do persist. There is a need to address these knowledge transfer (KT) issues. We aim to assess a KT scheme for the use of evidence in prevention, in regional health agencies and non-profit organizations for health education and promotion, in 4 French regions.

Methods:

We use a comparative multiple case study and a realist evaluation to examine what work, under what conditions, for whom. Realist evaluations are based on middle range theories (MRT) that describe the interactions between contexts-C, mechanisms-M and outcomes-O, i.e. CMO configurations.

With a literature review and a seminar with professionals we built an initial MRT. It led to 4 theories of intervention that are applied in regions since May 2017 (T0). We collected data with 36 interviews, 61 questionnaires at T0 and, 10 interviews, 18 observations, 4 focus groups during implementation.

We now run a second wave of interviews and questionnaires (Apr. 2019; T1) to validate the CMO configurations.

Results:

The initial MRT we built says that an effective KT scheme needs to combine an access to and an adaption of knowledge, the development of professionals’ skills, organizations and processes improvement. With T0 interviews, we identified 7 C (e.g. organizational, financial) and 13 M (e.g. ability to identify scientific evidence, motivation to use it because of its utility perceived, etc.). With T0 questionnaires, we identified use of scientific evidence O. We developed a KT taxonomy with implementation data. T1 analysis will provide the CMO configurations of an effective KT scheme in prevention sector, with a view of transferability into other contexts.

Conclusions:

KT guidelines for France will be developed at the end of 2019.

Main messages:

We provide a methodological example of a realist evaluation (and how to collect and refine CMO configurations) and the parameters of successful KT strategies in local prevention sector.

Impact of the TC-REG project on decision-makers and field professionals’ practices

Karyne Pierre-Louis

K Pierre-Louis[1], *C Chaussignand*[2], *T Delescluse*[3], *A Kaldé Frientz*[1], *N Saint-Aimé*[1], *N Babot*[1], *S Marchais*[2], *C Pornet*[3], *F Mouda*[3], *M Boucher*[3]
[1]IREPS Martinique, Lamentin, France
[2]CRES PACA, Marseille, France
[3]IREPS Normandie, Rouen, France
Contact: karyne.pierre-louis@ireps-martinique.fr

Background:

The TC-REG project aims to assess a KT scheme for the use of evidence in prevention, in regional health agencies and non-profit organizations for health education and promotion, in 4 French regions. The objective of the presentation is that decision-makers and field professionals from 3 regions involved in TC-REG (Martinique, PACA, Normandie) share their experience and the impact of this research on their practice.

Methods:

In Martinique, they developed a KT scheme using interactive and participative methods. In PACA, the KT scheme was based on various methods, including the participation of local actors, experts or health promotion actors, in order to analyse, select and popularize the relevant evidence for local actions. In Normandie, the KT strategy was composed of diffusion on evidence, exchange, training, interactive and participative methods with reflexive workshop. All the schemes aimed to improve the communication on evidence, develop professionals’ skills to use it and modify the organizations to facilitate its use.

Results:
